# INTRODUCTION

---

**W**ITH the close of the year 1945—the year of the war's end and of the atomic bomb—men and women hoped for good will and peace and, as usual, didn't quite know where to find them. This ninth of a series of annuals which reflects the events and decisions of a most critical decade in the life of the world carries, among many other matters, the plans and agreements of the Conference at San Francisco, Bretton Woods, Yalta, Potsdam and Chapultepec. In this volume is to be found, no doubt, promise of an effective design for security against the threatening disasters of the future. But who is wise enough to recognize this promise? Who disinterested and strong enough to follow the design?

Confused by the conflict of loosely defined ideologies, we have at the moment no commonly accepted meanings for hopeful words like truth, freedom, tolerance, liberalism, democracy. And the pattern of peaceful international relations cannot be perfected unless there is a trustworthy language for communication.

Men and women, aware of the world's tragic problems, have a right to expect honesty in our intercourse. In the face of the threat of the atomic bomb we can afford no evasions, no semitruths—the spokesmen of the world must talk turkey and there must be not only an earnest desire for peace everywhere, but courage and patience to search for it.

It is clearly indicated that compromises must be made to keep peace, but never in anything less than justice dictates. The world surely cannot survive another war.

The Book of the Year reflects whatever persons think and do. Courage and sacrifice and honesty can be found in this book. That cruelty and crime, and subterfuge and lies are also herein reflected is the world's fault, not the book's.

WALTER YUST

## MARCH

- 1 St. David's day

# CALENDAR OF EVENTS, 1945

For elections and disasters of 1945, see under those headings in the text. For obituaries of prominent persons who died during 1945, see under the entry Obituaries.

## JANUARY

**1 Adolf Hitler** said German people would never capitulate because surrender would mean "enslavement."

**Sec'y of State Stettinius** announced U.S. would continue to recognize Polish regime in London despite formation of Russian-sponsored Lublin committee.

**France formally** joined United Nations.

**Capture of two German agents** who were landed in U.S. by U-boats was announced by FBI.

**Enactment of laws** which would make about 4,000,000 men in 4-F draft classification available for essential industries was suggested by OWM Director Byrnes.

**2 Gen. Nicholas Plastiras** was designated to form government as Greek civil war continued to rage.

**Japanese military targets** and other installations on Formosa and Okinawa Island were battered by U.S. carrier planes.

**3 Battle of Ardennes** reached turning point as U.S. 1st army attacked German lines on northern perimeter of Belgian bulge.

**Philippine Island of Marinduque** was occupied by Lt. Gen. Walter Krueger's U.S. 6th army.

**Strategic Burmese port** of Akyab was occupied by British imperial amphibious forces.

**House of representatives** voted 207 to 186 to put Committee on Un-American Activities on permanent basis.

**4 Geoffrey Francis Fisher**, bishop of London, was named archbishop of Canterbury.

**5 Disclosure that Marshal Montgomery** had assumed command of U.S. 1st and 9th armies when Germans threatened to spill through Ardennes Bulge was made by S.H.A.E.F.

**Soviet union** recognized provisional Lublin government, bringing to head Big Three quarrel over fate of postwar Poland.

**6 Pres. Roosevelt** asked congress to enact national service law that would fully mobilize nation's manpower as war entered "critical phase."

**8 U.S. carrier planes** launched savage attacks on Japanese targets on Formosa and Ryukyu Islands.

**9 U.S. troops** under Gen. MacArthur's command landed on Luzon Island at Lingayen gulf, about 107 mi. from Manila.

**Pres. Roosevelt** asked congressional approval of \$83,000,000,000 budget for 1946 fiscal year, of which \$70,000,000,000 would be earmarked for war effort.

**10 Proposal that U.S., Russia, Britain, France and China** sign immediately a "hard and fast" treaty to keep Germany and Japan permanently demilitarized was made by Sen. Vandenberg.

**Argentine government** announced it would not participate in meetings of Pan American Union so long as that body continued to "disregard Argentine rights."

**11 Cancellation of passenger train service** providing seasonal transportation to resort towns, and of all trains whose seats were 65% vacant during Nov. 1944 was ordered by Col. John Monroe Johnson, ODT chief.

**Japanese bases in French Indo-China**, including Saigon, were subjected to blistering attack by carrier planes of U.S. 3rd fleet which sank 41 Japanese ships and damaged 28 others; 112 Japanese planes were destroyed.

**12 Marshal von Rundstedt's** armies began retreat from Ardennes Bulge.

**Russians** opened giant drive in south central Poland, advancing 25 mi.

**13 China coast** was attacked for first time by U.S. carrier planes which bombed Japanese targets at Hong Kong, Amoy and Swatow.

**15 Nation-wide dimout** of lighting in outdoor show windows, signboards and theatre marquees to start Feb. 1 was ordered by WPB Chairman Krug to conserve dwindling coal stocks.

**Gen. Sultan**, commander of U.S. forces in Burma and India, announced that Ledo road linking

India and China had been completed.

**17 Warsaw** was liberated by Red army troops.

**18 Heavy U.S. army casualties** in Dec. 1944 in western Europe, which totalled 74,788 men, were believed due to German offensive in Ardennes forest.

**E.A.M. (National Liberation Front)** party of Greece was assailed as "Trotskyites" by Prime Minister Churchill, who also appealed for greater Big Three unity.

**19 German lines in Poland** collapsed under sledge-hammer Russian onslaughts as soviet forces captured Lodz, Cracow and Tarnow and reached border of German Silesia.

**German Ardennes counter-offensive** was termed failure by Allied supreme headquarters which added that von Rundstedt's drive had not "seriously affected" Allied plans.

**20 Franklin D. Roosevelt** was inaugurated for fourth term as president of U.S.

**Disclosure that 6,300 of 15,600** Canadian soldiers scheduled for overseas duty were absent without leave was made by Canadian national defense headquarters.

**Provisional Hungarian regime** seated at Debrecen signed armistice agreement with U.S., Russia and Britain; Marshal Klementiy Voroshilov signed truce document for Big Three.

**U.S. forces** sweeping southward through Luzon captured Tarlac and were only 65 mi. from Manila.

**21 Hungary** surrendered unconditionally to Allies, declared war on Germany and agreed to pay equivalent of \$300,000,000 in reparations in kind, U.S. state department disclosed.

**Soviet armoured columns** drove 19 mi. into German Silesia, and to the north captured Junker shrine of Tannenberg in East Prussia.

**Jesse Jones** acceded to Pres. Roosevelt's request and resigned as secretary of commerce and as head of government financing agencies.

**22 King Peter of Yugoslavia** dismissed Dr. Ivan Subasitch as premier because of latter's willingness to co-operate with Marshal Tito's regime.

**23 Marshal Ivan S. Konev's** 1st Ukrainian army reached

Oder river on 37-mi. front in drive to engulf all of German Silesia.

**24 Lt. Gen. Ben Lear** was named deputy commander in European war theatre, Allied headquarters announced.

**25 Henry Wallace** denied charges of unfitness to handle government finance agencies as secretary of commerce, declaring that real issue was between big and little business.

**Sec'y Stimson** confirmed that Gen. Stilwell had been named commander of U.S. army ground forces.

**U.S. troops** overran Clark field and Fort Stotsenburg in drive toward Manila.

**26 Herbert C. Pell** resigned as U.S. member of United Nations War Crimes commission after congress failed to appropriate funds for his post; Pell had championed more vigorous action in prosecuting war criminals.

**New York Yankees baseball club** was purchased for estimated \$2,800,000 by syndicate headed by Col. Larry S. MacPhail.

**Report by Donald Nelson**, who visited China at Roosevelt's behest, noted substantial improvements in China's economic and military effort.

**27 Stoppage in making or delivering** machinery for production of peacetime goods was ordered by WPB.

**28 Baltic port of Memel** and Silesian industrial centres of Beuthen and Katowice fell to Russian armies.

**Generalissimo Chiang Kai-shek** named new Burma-Ledo road after Gen. Stilwell.

**29 Marshal Zhukov's 1st White Russian army** invaded Pomerania in powerful drive aimed at Berlin.

**King Peter of Yugoslavia** backed down on regency dispute and reappointed Dr. Subasitch as premier.

**30 Adolf Hitler** told his countrymen that he expected them to die in their tracks in defense of Germany.

**Naval base of Olongapo** on Subic bay fell to U.S. forces in Luzon.

**513 captives** were rescued from Japanese prison camp in

## JANUARY—Continued

eastern Luzon by U.S. Rangers and Philippine guerrillas.

## FEBRUARY

**1** Sinking of huge Singapore floating dock by U.S. Superfortresses was indicated in reconnaissance photographs.

**2** U.S. and French troops battled way into Alsatian city of Colmar after hard street fighting.

Alexei was unanimously elected patriarch of Russian Orthodox Church by Council of Bishops convening in Moscow.

**3** 3,000 tons of explosives and incendiaries were rained on Berlin by more than 1,000 U.S. 8th air force bombers in raid co-ordinated with Red army's drive on reich capital.

Troops of U.S. 1st cavalry division entered Manila and captured Santo Tomas prison camp, freeing several thousand internees.

**5** Gen. de Gaulle demanded separation of Rhineland and Ruhr from reich and occupation of entire Rhine area by French troops; he also declared France would not be bound by decisions reached by Big Three in absence of France.

Electoral defeat of Defense Minister McNaughton of Canada was viewed as sign of popular disapproval of Prime Minister Mackenzie King's failure to apply full conscription for overseas duty.

**6** Fall of Manila was formally proclaimed by Gen. MacArthur although isolated Japanese units in city continued resistance.

**7** Marshal Zhukov's armies reached Oder river near Kuestrin and were 38 mi. from Berlin.

Hubert Pierlot resigned as premier of Belgium.

**8** Premier Pieter Gerbrandy's cabinet resigned and he was renamed to form Netherlands government to include representatives of liberated areas.

**9** Large squadrons of German jet-planes struck back at 1,300 U.S. bombers and 850 fighter escorts that raided German oil refineries, factories and rail yards.

U.S. war department reported that Gen. Wainwright and 177 U.S. war prisoners were shifted from Japanese prison camps in Formosa to Manchuria.

**10** Proposal calling for 29 amendments to Dumbarton Oaks plan for world security was submitted to U.S. and Britain by Polish government in London.

Baltic port of Elbing fell to Russian armies in East Prussia.

Large force of B-29 Superfortresses launched heavy daylight attack on Tokyo, leaving wake of great fires in industrial areas.

Pres. Roosevelt, Premier Stalin and Prime Minister Churchill met at Yalta, Feb. 4-11, and agreed (1) to crush nazism and German militarism; (2) to establish popular governments in liberated countries; (3) to make Germany pay reparations in kind for war damages; (4) to set up occupation zones in conquered Germany; (5) to call a United Nations conference at San Francisco, Calif., April 25; and (6) to broaden base of Polish and Yugoslav governments.

Achille van Acker, Socialist, formed coalition Belgian government, including representatives of Communist and Conservative parties.

**12** Pres. Roosevelt urged congress to take immediate action on Bretton Woods proposals, declaring U.S. participation in fund and bank were essential to plans for "peaceful and prosperous world."

British-supported Greek government and E.A.M. leftist parties reached accord to end civil war.

**13** Russian forces won all Budapest after bitter 50-day siege in which German and Hungarian defenders suffered estimated 159,000 casualties.

Polish regime in London said it could not be bound by Yalta

decisions for revising Poland's frontiers.

U.S. delegation named to attend San Francisco parley included Sec'y of State Stettinius, Cordell Hull, Senators Connally and Vandenberg, Representatives Bloom and Eaton, Comdr. Stassen and Dean Virginia Gildersleeve.

**14** Capture of Cavite naval base on Luzon by 11th air-borne division was announced in U.S. army communiqué.

Two German agents, William C. Colepaugh and Erich Gimpel, were sentenced to death by hanging after secret trial by U.S. military commission.

**15** Dresden was left in smoldering ruins after fourth heavy Allied air attack on city in 48 hours.

**16** Induction into armed forces of men under 38 who were not qualified for full military service but who left war jobs was disclosed by war department.

Torpedoing and sinking of Japanese prison ship carrying 1,800 Americans was reported to war department by five survivors of disaster.

U.S. air-borne and ground forces invaded Corregidor.

visional international regime to govern Tangier was announced by U.S., Russian, British and French experts convening in Paris.

**23 Price controls** on mercury, aluminum and magnesium were removed by OPA Administrator Chester A. Bowles, who promised that small quantities of household utensils would be on sale in autumn at 1942 prices.

**United Nations charter** was ratified without dissenting vote by both houses of British parliament.

**Premier Stalin** announced that Red army had won complete victory over Japanese in Manchuria and that fighting in that area had ended.

**British, U.S. and French troops** formally entered Vienna to share in occupation of Austrian capital with soviet armies.

**24 Prime Minister Attlee** told house of commons that abrupt termination of lend-lease left Britain in "very serious financial position"; in Washington, FEA Administrator Leo T. Crowley disclosed six-point program to enable Britain to bridge transition, but asserted British well knew that lend-lease had to end with finish of war.

**WPB removed all controls** on output of passenger motor cars.

**Britain was accused** of denying Australia "equality of footing" in Japanese peace discussions by Herbert Vere Evatt, Australian minister of external affairs.

**25 Nelson Rockefeller** resigned as assistant secretary of state and was replaced by Spruille Braden, U.S. ambassador to Argentina.

**Pres. Truman and Gen. de Gaulle**, in joint statement at White House, asserted their talks showed existing "fundamental harmony" between France and U.S. and agreed to even closer co-operation in future.

**Bulgaria yielded to Allied recommendation** to delay scheduled elections to democratize more thoroughly voting procedure.

**26 Chinese nationalist forces** entered Shanghai and Nanking, Chungking announced.

**27 Congress was urged by Pres. Truman** to continue draft of men between 18 and 25 for military service because of world crisis and to release veteran combat soldiers.

**28 Mao Tse-tung**, Chinese communist leader, arrived in Chungking for conference with Chiang Kai-shek designed to avert civil war.

**Occupation of Japan** was begun by a force of about 150 U.S. soldiers who landed at Atsugi airfield.

**29 Hermann Goering**, Joachim von Ribbentrop, Hjalmar Schacht and 21 other nazi civilian and military leaders were indicted by Allied jurists as war criminals.

**Findings of army and navy inquiry boards** on Pearl Harbor attack were released by Pres. Truman; probes indicated that lack of preparedness, confusion and lack of co-ordination between services combined to cause U.S. defeat in first blow of World War II; criticism of Gen. Marshall in army report was branded as "entirely unjustified" by Sec'y of War Stimson.

**30 Gen. MacArthur** landed in Japan and set up temporary headquarters in Yokohama.

**Government reduced red-point ration value** for meat, cheese and fat. Pres. Truman urged congress to achieve equitable solution of lend-lease debts, asserting that any effort to collect outright \$42,000,000,000 lent Allies would threaten their political stability and sow seeds of new war.

**Pres. Truman** asserted that country itself was just as much to blame as its military leaders for lack of preparedness that resulted in Pearl Harbor disaster.

**31 Office of War Information** was abolished by Pres. Truman who transferred some of its functions to state department.

**Sec'y of State Byrnes** declared assumption that entire lend-lease debt to Allies would be cancelled was unjustified and warned

against "generalizations" in connection with Pres. Truman's earlier lend-lease statement.

SEPTEMBER

**1 Pres. Truman** proclaimed Sept. 2 as V-J day and called on U.S. to strive for world of good will.

**2 World War II** was officially ended as Japanese envoys signed formal surrender documents aboard U.S.S. "Missouri" anchored in Tokyo bay; Foreign Minister Mamoru Shigemitsu signed for Japanese government and Gen. MacArthur, for Allies.

**Premier Stalin** announced that defeat of Japan enabled Russians to regain southern half of Sakhalin Island and Kurile chain, both wrested from Russia in Russo-Japanese War of 1904.

**Japanese garrisons in Palau group**, Truk, Rota and Pagan Islands surrendered to U.S. commanders.

**3 Generalissimo Chiang Kai-shek** declared that political armies would not be tolerated within China's borders.

**Gen. Tomoyuki Yamashita** surrendered remnants of his Japanese army in Philippines to Gen. Jonathan M. Wainwright.

**4 Gen. MacArthur** issued directive instructing Japanese to speed demobilization of their armed forces.

**Japanese garrison on Wake Island** surrendered to U.S. forces.

**Disclosure that U.S.** had given tacit agreement to return of Sakhalin and Kurile Islands to soviet union was made by Sec'y of State Byrnes.

**Emperor Hirohito** personally opened Japanese diet session with appeal to his people to "win confidence of world," and set up peaceful state.

**British dominions office** in London announced that Lt. Gen. Sir Bernard Freyberg had been appointed governor general of New Zealand.

**5 State department report** accused Japanese of massacring, torturing and starving

## SEPTEMBER—Continued

U.S. prisoners and asserted Japanese government virtually ignored 19 U.S. protests against atrocities.

**U.S. navy urged congress** to retain chain of nine bases won in Pacific and to establish six bases in Atlantic.

**Pres. Truman appointed Benjamin V. Cohen** as counselor in state department and Donald S. Russell and William Benton as assistant secretaries of state.

**6 A 21-point legislative program**, designed to achieve "as full peacetime production and employment as possible in most efficient and speedy manner," was contained in Pres. Truman's message to congress.

**Sinclair Oil corporation** announced it had received 50-year concession from Ethiopia to develop country's oil resources.

**Congress was told by OPA Administrator Chester A. Bowles** that he hoped to end all rationing in 1945 but said wage and price controls should continue as long as inflation threat remained.

**Congressional investigation** of Pearl Harbor disaster, endorsed by Pres. Truman, was unanimously voted by senate.

**Paul V. McNutt** was named high commissioner to Philippines.

**8 Sec'y of Navy Forrestal** objected to full disclosure of all Pearl Harbor facts on grounds it would compromise "sources of information" vital to national security.

**9 Gen. MacArthur**, outlining policy for ruling Japan, emphasized that he was over-all authority but that people and emperor would be permitted reasonable self-rule under Allied directives.

**Large contingents of U.S. troops** marched into Tokyo as other U.S. forces landed in Korea and other sections of Japan and Japanese empire.

**Gen. Yasuji Okamura** surrendered 1,000,000 Japanese troops to Gen. Ho Ying-chin, Chinese chief of staff in Nanking ceremony.

**Lt. Gen. John R. Hodge** received formal surrender of Japanese troops in U.S. occupation zone of Korea, and retained Japanese administrators in office to carry out his directives.

**Canada resumed meat rationing** to assure adequate supplies for export to United Kingdom and liberated countries.

**Recommendation** that U.S. share secret of atomic bomb was sent to Pres. Truman by 64 faculty members and research scientists of University of Chicago.

**10 Emperor Hirohito** was ordered by Gen. MacArthur to abolish Japanese imperial general headquarters as of Sept. 12.

**Foreign ministers** of five Allied powers opened conference in London.

**Vidkun Quisling**, Norwegian nazi, was sentenced to death in Oslo court for high treason.

**11 Gen. MacArthur** ordered arrest of 40 prominent Japanese civilians and military leaders on charges of war crimes.

**Lt. Gen. John R. Hodge** was instructed by Gen. MacArthur to replace all Japanese administrators in Korea as rapidly as was consistent with safety.

**Senate resolution** requesting congressional probe of Pearl Harbor disaster was approved in house of representatives without dissenting vote.

**12 Francis Biddle** was appointed U.S. judge on board of international tribunal which was to try axis war criminals; Judge John J. Parker was named as his alternate.

**13 Use of U.S. troops** to occupy major Chinese cities and enforce Chungking's orders until situation was "stabilized" was declared possibility by Lt. Gen. Albert C. Wedemeyer, commander of U.S. troops in China.

**14 Premier Stalin**, in interview with Sen. Pepper, asserted principal objectives of soviet union were to repair war damages, rebuild industrial strength and raise standard of living.

**Ford Motor company** virtually stopped production in all its plants because unauthorized strikes crippled output schedules.

**16 Pres. Philip Murray** of C.I.O. asserted U.S. steel industry amassed \$2,000,000,000 in open and concealed profits during five years of war output.

**17 Josef Kramer** and 44 S.S. aids went on trial in British military court in Lüneburg on charges of conspiracy to commit mass murder in nazi concentration camps at Belsen and Oswiecim.

**18 Henry L. Stimson** resigned as secretary of war and Pres. Truman designated Robert P. Patterson as his successor.

**Sen. Harold H. Burton** of Ohio was named by Pres. Truman to supreme court.

**Pres. Truman** placed War Labor board, U.S. Employment service and War Manpower commission under Sec'y of Labor Schwellenbach; and also merged Office of Emergency Stabilization and Office of War Mobilization and Reconversion with John W. Snyder as over-all head.

**19 Dean G. Acheson**, under-secretary of state, asserted that U.S. government, not Gen. MacArthur's occupation forces, would determine policy on Japan.

**People of India** were promised by Prime Minister Attlee that positive measures would be taken immediately after Indian elections to assure them full self-rule.

**William Joyce**, who worked for nazis as radio broadcaster and was known to British as Lord Haw Haw, was sentenced to be hanged for treason after three-day trial in Old Bailey.

**Eric A. Johnston** succeeded Will H. Hays as president of Motion Picture Producers and Distributors of America, Inc.

**20 State department** disclosed that Arthur B. Emmons, foreign service officer, would be sent to Japan to establish direct liaison with Gen. MacArthur.

**21 Demand that southeast Asia possessions** of European powers be freed from "imperialist domination" was made in Bombay by working committee of All-India Congress party.

**22 Document issued by White House** dated Sept. 9 called for strong political, economic and military curbs to eliminate Japan as menace to world peace.

**Japanese government** was ordered to furnish U.S. authorities with complete data on its banks, insurance companies and imperial household finances.

**Gen. George S. Patton, Jr.**, declared in interview that he had "never seen necessity of denazification program" and compared "this nazi thing" to "Democratic and Republican election fight."

**23 Withdrawal of British troops** and incorporation of Anglo-Egyptian Sudan into Egypt was demanded by cabinet of Premier Mahmoud Nokrashy Pasha.

**24 Strike of elevator operators** of more than 2,000 buildings in Manhattan paralyzed commercial activity in

New York's skyscraper district.

**Anglo-U.S. oil pact** was signed in London by Harold L. Ickes, U.S. petroleum administrator, and Emanuel Shinwell, Britain's fuel minister.

**25 Congress** was asked by Pres. Truman to slash more than \$28,500,000,000 from war department's appropriations.

**Nazi party** was declared illegal and abolition of all German armed forces as well as semi-military organizations was decreed in new Allied proclamation.

**26 State of siege was revived in Argentina** after government initiated wave of arrests in move to quell growing discontent with totalitarian Perón government.

**Letter written by Pres. Roosevelt** March 10 in which he said Spain could expect no help from U.S. as long as totalitarian Franco regime remained in power was made public by state department.

**27 Emperor Hirohito** shattered precedent and paid a visit to Gen. MacArthur.

**Foreign Economic administration** was abolished by Pres. Truman.

**28 War department** announced that Gen. Wainwright had been named commander of east defense command.

**29 Gen. Eisenhower** urged that four Allied occupation powers take steps to prevent economic chaos in reich by bringing that nation to solvency at subsistence level.

**Survey asserting** that U.S. occupation authorities in reich "appeared to be treating Jews as nazis treated them, except that we do not exterminate them," was made public by Pres. Truman; survey was made by Earl G. Harrison, U.S. representative on Inter-Governmental Committee on Refugees, after inspecting camps of displaced persons in Germany. Pres. Truman acting on Harrison report directed Gen. Eisenhower, in letter dated Aug. 31, to alleviate "shocking" treatment of displaced Jews in Germany.

## OCTOBER

**1 All restrictions on fraternizing** between Allied soldiers and Germans, save for certain bans on intermarriage, were relaxed by Allied control council.

**2 Gen. Eisenhower's headquarters** announced removal of Gen. Patton as U.S. 3rd

OCTOBER—Continued

army commander in Bavaria; Patton was replaced by Lt. Gen. Lucian K. Truscott, Jr.

Council of five foreign ministers in London terminated parity with no accord on any major issues.

**3 Prompt creation of atomic energy commission** to regulate all phases of nuclear energy was urged by Pres. Truman in special message to congress.

**Foreign Commissar Vyacheslav Molotov** of U.S.S.R. ascribed stalemate of council of foreign ministers to refusal of other delegates to accept soviet compromise plan to continue discussions.

**U.S. refusal** to associate itself with Argentina because of latter's repudiations of international obligations resulted in postponement of Rio de Janeiro parity for concluding hemispheric military alliances.

**4 Strike-bound properties of 26 oil-producing and refining firms** were taken over by navy on Pres. Truman's orders.

**Batavia dispatches** said Indonesian nationalists had taken over Surabaya and other Javanese cities.

**5 Sec'y of State Byrnes** attributed much of disagreement at council of foreign ministers to Russia's suspicions of western Allies.

**Transcontinental U.S. phone service** was paralyzed for period of four to six hours by strike of Bell system workers demanding higher wages.

**Duke of Windsor** returned to Britain after six years of absence to visit royal family.

**6 Chinese communists** charged Chiang Kai-shek's armies had attacked, with Japanese aid, Chinese communists in territory controlled by latter in central China.

**Baron Kijuro Shidehara** formed new Japanese cabinet and pledged full co-operation with Allied military authorities.

**Sir Walter Citrine** was elected president of World Federation of Trade Unions.

**8 Pres. Truman** declared U.S. had no intention of disclosing to any other nation industrial secrets in manufacturing atomic bomb.

**9 Warning** that U.S. would court "disaster" if it disarmed was sounded by Gen. Marshall in his biennial report.

**Col. Juan Perón** was compelled to resign all of his government posts by uprising of army forces in Argentine military base at Campo de Mayo.

**Pierre Laval** was sentenced to death by Paris high court of justice for plotting against state and for intelligence with enemy.

**10 Detroit Tigers defeated Chicago Cubs** 9 to 3, thus winning baseball's world series by four games to three.

**New constitutional status** for British Malaya, which would merge Malay states and Straits Settlements into a Malayan union and make Singapore independent colony, was announced by British colonial office.

**Tax reduction** of \$5,350,000,000 for 1946 was voted by house of representatives by 343 to 10.

**"Incentive" price increases** were approved by John D. Small, chief of new Civilian Production administration.

**Gen. MacArthur** presented Premier Shidehara with five-point program designed to democratize Japanese institutions.

**12 Gen. Anton Dostler** of German general staff was sentenced to death by U.S. military court in Rome for ordering shooting of 15 U.S. soldiers without trial in March 1944.

**Announcement** that members of nazi party would be deprived of vote was made by Gen. Eisenhower.

**Canadian income tax cut** of 16% was among five important tax reductions announced by Finance Minister J. L. Ilsley.

**13 400 scientists** at Los Alamos government laboratory warned in signed statement that efforts to keep secret of atomic bomb would lead to "unending war more savage than last."

**Indonesian people's army** issued proclamation calling for all-out guerrilla warfare in Batavia area of Java.

**14 Allied armies took over Batavia** and declared looting, sabotage and bearing of arms would be punishable by death.

**15 Pierre Laval** was executed by firing squad after his attempt to cheat executioners by taking poison failed.

**17 Coal strike** was ended at order of John L. Lewis, president of United Mine Workers of America.

**Col. Juan Perón** was released

by army and returned to Argentine political scene in former role as "strong man" of Farrell regime.

**Archbishop Damaskinos** ended prolonged cabinet crisis in Greece by taking over government as provisional president.

**18 Indictment** of 24 nazi war leaders of Hitler's reich on charges of plotting against world peace was presented before international military tribunal.

**Sec'y of State Byrnes** said U.S. would make no final decision affecting Palestine without prior and full consultation with both Arabs and Jews.

**International machinery** to prevent rate wars was set up by 57 world air lines in Montreal conference.

**Port strike in New York** was ended by National Maritime union after 18 days.

**19 R.A.F. Marshal Sir Arthur W. Tedder** was appointed chief of air staff and senior member of air council, succeeding retiring R.A.F. Marshal Lord Portal, British air ministry announced.

**20 General Eisenhower** recommended concrete proposals to prevent I.G. Farbenindustrie from ever again becoming menace to peace; these included dynamiting of arms plants, breaking up of cartels and use of firm's equipment as reparations.

**Chancellor Karl Renner's regime** was recognized as *de facto* provisional government of Austria by Allied control council.

**U.S. and Belgium** arranged interim settlement of lend-lease relations under which U.S. agreed to repay Belgium for \$90,000,000 in reverse lend-lease.

**Achmed Soekarno**, Indonesian leader, called on Pres. Truman to stop Netherlands from using lend-lease equipment to put down Indonesian independence movement.

**21 Revolutionary government** headed by Pres. Romulo Bettancourt won solid control of Venezuela after brief period of civil strife.

**Communists** emerged as strongest single party in French elections with Socialists and Popular Republican movement close behind.

**23 Pres. Truman**, warning that peace must be built on power, recommended to joint congressional session immediate legislation of one year's military training for U.S. youth.

**Promises of substantial reductions** in all categories of taxes were made to British people by Hugh Dalton, chancellor of exchequer, in presenting Labour government's first budget to house of commons.

**24 Recommendation** that legal minimum wage should be raised to 65 cents and ultimately to 75 cents hourly was made to house labour committee by Sec'y of Labor Schwellenbach.

**United Nations World Security organization** came into being when soviet union ratified charter, which with legal majority of 29 ratifications became "law of nations."

**Vidkun Quisling** was executed by Norwegian firing squad.

**25 Employees of General Motors corporation** voted 70,853 to 12,438 in favour of strike if necessary to get wage increase of 30%.

**Sir Alexander Fleming**, Dr. Ernest Boris Chain and Sir Howard W. Florey were awarded 1945 Nobel prize for penicillin research.

**27 Pres. Truman** said U.S. would not recognize government forced upon any nation by foreign power and asserted U.S. held atomic bomb as sacred trust.

**Netherlands government** ordered Dr. Hubertus van Mook, acting governor-general of Netherlands East Indies, to initiate negotiations with Indonesian nationalists.

**29 Trial of Gen. Tomoyuki Yamashita** on charges of being war criminal was opened in Manila before U.S. military court.

**Getulio Vargas** resigned as president of Brazil and José Linhares, chief justice of supreme court, assumed role as interim president until election.

**End of automobile rationing** was announced by OPA and WPB.

**30 Pres. Truman** asserted U.S. industry could afford higher wages without increasing prices, but told labour not to expect as much money as they made during war boom era.

**Shoe rationing** was ended by OPA.

**House of representatives** voted unanimously for peacetime U.S. navy consisting of 6,084 combat and auxiliary ships and 12,000 planes; this force would be larger than fleets of all other nations combined.

**New Venezuelan government**

## OCTOBER—Continued

was recognized by U.S.

**31 Gen. Eisenhower** reported social, political and economic aims of Potsdam declarations were being carried out satisfactorily in U.S. occupation zone of reich.

## NOVEMBER

**1 Plans to nationalize** all British air transport and empire's communications system were announced by British Labour government.

**British intelligence officers** said exhaustive investigation suggested that Adolf Hitler had married Eva Braun April 29 and that both committed suicide the following day in a bunker in Berlin.

**2 Several hundred persons** were hurt in clashes with police as anti-Zionist mob in Cairo set fire to Jewish shops and a synagogue.

**Hungarian provisional government** was recognized by the United States.

**4 Small Landholders party** won decisive majority in national and municipal elections in Hungary.

**5 Pres. Truman opened labour-management conference** in Washington with warning that failure to establish broad and permanent basis for industrial peace would mean legislation by congress.

**Charges that U.S. troops in China** were actively collaborating with Chungking troops in attacks on Chinese communist forces were made by Chinese Communist party organs.

**At least 74 Jews were killed** and 183 others were injured in outbreak of anti-Semitic riots in Tripoli (Tripolitania) and nearby towns.

**6 William O'Dwyer**, Democratic and American Labor party candidate, was elected mayor of New York city.

**Edward J. Jeffries** was re-elected mayor of Detroit, defeating Richard T. Frankenstein, C.I.O. candidate.

**Foreign Commissar Molotov** decried use of atomic energy as instrument of power politics and predicted that Russia would have atomic energy in the future.

**7 World air speed record** of 606 m.p.h. was claimed for British jet-plane which made four runs over 70-mi. course off south coast of England.

**8 Proposal that United Nations** outlaw production or possession of atomic bomb, thus solving Big Three differences over control of weapon, was made by Capt. Harold E. Stassen.

**9 C.I.O. members of Ford Motor company** voted 42,235 for and 3,951 against strike in support of their 30% wage increase demand, NLRB announced.

**10 Sec'y of Labor Schwel-lenbach** urged Pres. Fairless of U.S. Steel Corp. to "reconsider" refusal to continue collective bargaining with C.I.O. United Steelworkers; Fairless had said he would not talk with union unless OPA first acted to increase steel price.

**11 Gen. Henry H. Arnold** warned U.S. must be prepared to strike back against unannounced robot attacks in future war, in final report to war department.

**12 Cordell Hull** was announced as winner of 1945 Nobel peace prize.

**13 Joint session of U.S. congress** heard Prime Minister Attlee warn that world civilization, "in terrible light of atomic bomb," could only survive through strong United Nations organization.

**Sutan Sjahrir** became premier of unrecognized Indonesian republic; Achmed Soekarno remained as president but his powers were greatly reduced.

**Anglo-U.S. agreement** to establish joint committee of inquiry to investigate entire problem of European Jews and Palestine was announced by Foreign Sec'y Ernest Bevin.

**15 Willingness of U.S., Britain and Canada** to share secret of atomic energy with other United Nations as soon as

"effective enforceable safeguards against its use for destructive purposes can be devised," was expressed in joint statement by Pres. Truman, Prime Minister Attlee and Prime Minister Mackenzie King.

**Investigation of Pearl Harbor attack** was opened by joint congressional committee; early disclosures showed that Japanese code fell into U.S. hands as early as Dec. 1940.

**Edwin S. Pauley**, Pres. Truman's special representative, said Japan's resources were so depleted that country could probably pay only "insignificant" reparations.

**Prof. Otto Hahn** of Berlin and Prof. Wolfgang Pauli of Vienna were awarded Nobel prizes for their researches on atomic fission; award for chemistry was given to Prof. Artturi Wirtanen of Helsinki; award for literature went to Gabriela Mistral, Chilean poet.

**16 Denial that any attempt** was being made to use atomic bomb as "diplomatic or military threat against any nation" was issued by Sec'y of State Byrnes.

**Creation of unified command** of U.S. armed forces was advocated by Gen. Eisenhower as essential to U.S. security and preservation of peace.

**At joint meeting** of American Philosophical society and National Academy of Sciences held at University of Pennsylvania, Dr. Irving Langmuir warned that an atomic war would release such tremendous radioactivity in atmosphere that whole world may become uninhabitable; Dr. J. Robert Oppenheimer said atomic bombs in future would be so cheap to produce that in next war they could be made by "thousands or tens of thousands"; Dr. Arthur H. Compton predicted that one-tenth of any country's population would be destroyed in first night of atomic bombing.

**17 Adm. Chester W. Nimitz** opposed unified command of armed forces on ground that such merger might hinder navy and reduce role of sea power in U.S. defenses.

**18 Revolt broke out** in northern Iran where Azerbaijan insurgents demanded broader autonomy for their province within framework of existing government.

**19 Adm. J. O. Richardson**, testifying in Pearl Harbor inquiry, quoted Pres. Roosevelt as saying (Oct. 8, 1940) that Japanese sooner or later "would make a mistake and we would enter the war."

**President Truman** asked congress to give immediate action on health and social welfare program which would include compulsory health insurance system under social security program.

**20 Appointment of Gen. Eisenhower** as U.S. army chief of staff succeeding Gen. George C. Marshall, and Adm. Nimitz as chief of U.S. naval operations succeeding Adm. Ernest J. King was announced by Pres. Truman; Gen. Joseph T. McNarney was appointed to succeed Eisenhower as commanding general of U.S. forces in European theatre, commander in chief of U.S. forces of occupation in Germany and U.S. representative on control council in Germany; Adm. Raymond A. Spruance was named to succeed Nimitz as commander in chief of Pacific fleet and Pacific ocean areas.

**World's nonstop**, nonrefuelling distance record of 8,198 mi. was achieved by B-29 flying from Guam to Washington, D.C., in 35 hr. 5 min.

**21 United Automobile Workers (C.I.O.)** called scheduled strike halting work in all General Motors Corp. plants throughout the U.S.; U.A.W. officials said walkout was 96% effective.

**Justice Robert H. Jackson**, opening prosecution against 20 top-ranking nazis on trial as war criminals at Nuernberg charged Germany had plotted war against U.S. in 1940.

NOVEMBER—Continued

**Pres. de Gaulle** and communists patched up row as former established national union cabinet which included communist representatives.

**22 Work of U.N.R.R.A.** was praised by Gen. Eisenhower who urged congress to appropriate adequate funds to feed starving people of liberated Europe.

**Japanese troops** under British command battled Indonesian nationalists in Java city of Semarang.

**23 Rationing of meat, butter** and all other red-point foods was ended.

**24 Ferruccio Parri** resigned as Italy's premier, with warning to his successor to "beware of civil war" and recrudescence of fascism.

**25 Conservative People's party** won more than half of 165 seats in Austrian national assembly in first free national election in more than decade.

**26 Proposal that soviet, British and U.S. troops** be withdrawn from Iran by Jan. 1 was announced by U.S. government.

**27 Patrick J. Hurley** resigned as ambassador to China and criticized professional and career diplomats whom he alleged were sabotaging U.S. foreign policy; Pres. Truman appointed Gen. George C. Marshall as special envoy to China with rank of ambassador.

**Uruguayan proposal** for collective hemispheric intervention to prevent establishment of oppressive regimes was given "unqualified adherence" by U.S. government, Sec'y of State Byrnes announced.

**Cordell Hull** branded as false

and "infamous" army report on Pearl Harbor that said he had "touched the button that started the war" with Japan.

**28 Ford Motor company** asked United Automobile Workers (C.I.O.) to agree to pay \$5 a day for each employee who took part in an illegal strike.

**John Amery** pleaded guilty to high treason and was sentenced to death at opening session of his trial in London.

**29 Constituent assembly** proclaimed Yugoslavia a republic and abolished monarchy.

**30 Labour-management conference** closed without making any signal accomplishments.

**Verbal bombshell** was thrown into Nuernberg war criminals trial by Rudolf Hess, who dramatically confessed that he had been shamming amnesia and insanity for "tactical" reasons.

**Alcide de Gasperi** was named premier of Italy.

DECEMBER

**1 United Auto Workers (C.I.O.)** agreed to General Motors Corp. suggestion that company open its auto parts plants to supply needs of other motor car manufacturers.

**Scores of German industrialists** who aided Hitler's climb to power were arrested by British authorities in Ruhr area.

**2 Nationalization of Bank of France** and four other private banks was approved in French National Constituent assembly by vote of 521 to 35.

**Allied headquarters** ordered Tokyo government to arrest 59 high-ranking Japanese on suspicion of being war criminals.

**3 Pres. Truman** asked congress to enact legislation similar to the Railway Labor act for solution of labour disputes; he also announced he would establish fact-finding boards to make recommendations for ending General Motors strike.

**State department** said U.S.

proposal for withdrawal of soviet, British and U.S. troops from Iran by Jan. 1 was rejected by soviet union.

**4 Pres. Philip Murray** of C.I.O. denounced Pres. Truman's proposal for new labour law and charged that Truman administration had yielded in "abject cowardice" to industry's refusal to "engage in collective bargaining."

**Sir Hartley Shawcross**, British prosecutor at Nuernberg trial, demanded that 20 nazis charged with war crimes be punished as object lesson for would-be war makers of future.

**Senate** voted 65 to 7 legislation permitting U.S. to participate fully and actively in United Nations organization.

**5 Lt. Gen. Leonard T. Gerow** told congressional Pearl Harbor inquiry board that he accepted responsibility for not demanding that Gen. Walter C. Short bolster defense measures at Pearl Harbor before Japanese attack.

**OPA Chief Chester A. Bowles** warned that public faced repetition of 1929 economic crash if it followed advice of "business pressure groups" trying to end price and rent controls.

**Destruction of Japan's cyclotrons** by U.S. army was branded an "act of utter stupidity" by Dr. Karl T. Compton in letter to Sec'y of War Patterson.

**Cost of living increase** from Jan. 1941 was formally set at 33% by Office of Stabilization Administration, which ruled that manufacturers could base request for higher prices to offset wage increases up to that level.

**6 General Motors offer** of 10% wage increase was rejected by striking United Automobile Workers (C.I.O.) which insisted on original demand for 30% increase.

**Gen. Marshall** admitted to Pearl Harbor inquiry board that he did not expect Japanese to attack Pearl Harbor because of great risk involved.

**Anglo-U.S. financial pact** under which U.S. agreed to advance Great Britain \$4,400,000,000 to expedite early resumption

of world trade was signed by Sec'y of State Byrnes, Sec'y of Treasury Vinson and Lord Halifax, British ambassador to U.S.

**Adm. William Halsey** denounced proposals for merging armed forces under single command as "wildcat scheme" which was "un-American, undemocratic and damn dangerous."

**Prediction that development** of stationary atomic power plants, said to be technically possible, could compete with \$15-a-ton coal in anywhere from 3 to 25 years was voiced by scientific experts at N.A.M. conference in New York.

**7 Gen. Marshall testified** at Pearl Harbor inquiry that Gov. Dewey had complied with Marshall's request not to make public during 1944 presidential campaign knowledge that U.S. had broken Japanese secret code.

**Recommendations** that Japan be stripped of virtually all steel, chemical and shipbuilding capacity, half its electric power and tool industries as well as all foreign assets were made by Edwin W. Pauley, U.S. reparations commissioner.

**Sec'y of State Byrnes** declared Hurley's accusations that state department officials had sabotaged U.S. policy in China were not backed up by specific evidence.

**State department** disclosed that about 1,750,000 Germans in Czechoslovakia and up to 500,000 in Hungary would be moved to U.S. occupation zone in reich.

**8 Leaders of United Automobile Workers (C.I.O.)** voted unanimously to reject President Truman's request to promptly settle General Motors strike and condemned his plan to use fact-finding boards to avert major walkouts.

**10 Japanese government** was ordered by Allied headquarters to abolish feudal system of land tenure.

**Undersec'y of State Dean Acheson** termed "utterly fantastic" Patrick Hurley's charges that Acheson "sabotaged U.S. policy in Iran."

## DECEMBER—Continued

**Judge Joseph C. Hutcheson** of Texas was named chairman of six-man delegation to represent U.S. on Anglo-U.S. committee of inquiry on Palestine question.

**United Automobile Workers (C.I.O.)** told Ford Motor Co. that they would penalize "wild-cat strikers" \$3 daily for first offense and \$5 for second offense provided company itself would accept penalties for company-provoked stoppages of production.

**Allied bombings** killed about 500,000 German civilians, injured 700,000 others and made 7,800,000 homeless, according to report by medical branch of U.S. Strategic Bombing survey.

**Senate Foreign Relations committee** dropped probe of charges by Maj. Gen. Hurley that career diplomats undermined his China policy.

**Pres. Truman** ignored opposition of organized labour and announced appointment of fact-finding board to recommend settlement of General Motors strike.

**Agreement for joint withdrawal** of troops from Syria and Lebanon and for mutual consultations on all middle eastern questions was basic feature of Anglo-French pact signed in Paris.

**British-U.S. loan agreement** was approved in commons by 345 to 98 vote; Bretton Woods agreement was also endorsed 314 to 50.

**14 nations** were invited by U.S. to attend preparatory session for International Trade conference and to negotiate agreements with U.S. for mutual lowering of tariffs.

**Dr. Karl Kobelt** was elected president of Swiss federal council for 1946.

**William D. Mitchell** disclosed he and his staff would resign as counsels to congressional Pearl Harbor committee because prolonged examination of witnesses had held up "much pertinent evidence."

**Josef Kramer, Irma Grese** and nine others convicted for crimes committed at Belsen and Oswiecim concentration camps were hanged in Hameln.

**Permanent site for United Nations organization** in United States was voted by U.N.O.'s preparatory commission by 30 to 14.

**Directive** ordering end of Shinto as state religion of Japan was

issued by Gen. MacArthur.

**16 Sinclair Oil corporation** ended long wage dispute by granting 18% pay increase and 40-hr. week to Oil Workers International union.

**17 Resolution urging U.S. aid** in establishment of Jewish commonwealth in Palestine and to permit free entry of Jews there was adopted by overwhelming voice vote in U.S. senate.

**U.S. supreme court** granted stay of execution to Gen. Tomoyuki Yamashita in order to examine petitions submitted by Yamashita's counsels for review of his trial.

**Second U.S. contribution** of \$1,350,000,000 to U.N.R.R.A. fund to relieve distressed areas abroad was voted by U.S. senate.

**18 Ford Motor company's** offer of pay increase of 15 cents an hour was rejected by United Automobile Workers (C.I.O.).

**House of lords** criticized "harsh" terms of U.S. loan to Britain, but ratified British-U.S. loan accord 90 to 8; about 100 conservative peers abstained from voting and some 600 others were absent.

**19 Pres. Truman** nominated Mrs. Eleanor Roosevelt, Edward R. Stettinius, Jr., and Senators Tom Connally and Arthur H. Vandenberg as U.S. delegates to United Nations organization; Stettinius was designated chief delegate.

**Congress** was asked by Pres. Truman to combine army and navy into single department of national defense under single cabinet officer.

**Pres. Truman's request** that Second War Powers act be continued to 1947 was rejected by 31 to 30 vote in senate, which instead limited act to June 30, 1946.

**Capt. Charles B. McVay III** was acquitted by navy court-martial on charge of neglecting to give prompt "abandon ship" orders when cruiser "Indiana-polis" was struck by Japanese torpedoes; court stated no finding on charge that McVay risked ship and crew by failing to follow zig-zag course.

**General Motors** announced it would refuse to submit its case to Pres. Truman's fact-finding board if the board demanded that the corporation open its books to disclose prices and profits.

**U.S. state department** urged both Dutch and Indonesian

nationalists in Netherlands Indies to seek peaceful solution of their conflict.

**British demands** that Siam supply between 1,000,000 and 1,500,000 tons of rice to other southeast Asia countries as war reparations were disclosed by Undersec'y of State Dean Acheson, who said U.S. was intervening in British-Siamese talks.

**20 Pres. Truman** authorized fact-finding boards to examine company books in wage disputes, ruling that "ability to pay" was always relevant to issue of wage increases.

**OPA ordered** end of tire rationing as of Jan. 1, 1946.

**Letters from two soviet scientists** demanding that Turkey cede 180-mi. stretch of Black sea coast to soviet union were published in leading Russian newspapers.

**Dr. Karl Renner** was elected president of 2nd Austrian republic.

**21 Sen. Kilgore** charged U.S. military government and state department had "signally failed" to carry out Potsdam terms in reich.

**22 U.S. and Britain** announced recognition of Yugoslav government of Marshal Josip Broz (Tito):

**Director Herbert H. Lehman** disclosed Ukrainian and White Russian republics signed agreement for U.N.R.R.A. aid.

**Pres. Truman** ordered that European refugees and displaced persons be permitted entry into U.S. up to limit permitted by immigration laws.

**23 Pope Pius XII** designated 32 prelates from 19 countries for elevation to rank of cardinal; among U.S. cardinal designates were Archbishops Francis J. Spellman of New York, Edward Mooney of Detroit, Samuel A. Stritch of Chicago and John J. Glennon of St. Louis.

**Pres. Truman** vetoed bill calling for cancellation of \$51,000,000,000, in war appropriations and contracts because he disapproved rider that would shift U.S. Employment service to state governments within 100 days.

**24 Sec'y Byrnes, Foreign** Sec'y Bevin and Foreign Commissar Molotov agreed at Moscow conference to resume drafting of peace treaties with Italy, Rumania, Bulgaria, Hungary and Finland.

**25 French finance ministry** announced franc would be

devalued to rate of 119.107 to dollar and 480 to pound.

**26 Pres. Truman** named Fio-  
rello H. La Guardia his personal representative to attend inauguration of Gen. Eurico Gaspar Dutra as president of Brazil.

**27 Wide agreement on control of atomic energy,** formula for drafting of European peace pacts, participation of soviet union in rule of Japan, creation of Big Four trusteeship for five-year rule of Korea, withdrawal of U.S. and soviet troops from China and measures to democratize Rumanian and Bulgarian governments were reached at Moscow conference by Sec'y of State Byrnes, Foreign Commissar Molotov and Foreign Sec'y Bevin.

**Bretton Woods accord,** franc devaluation and agreement for purchase credit with U.S. Export-Import bank were approved by French Constituent assembly.

**International Monetary fund** and Bank for Reconstruction and Development was formally established after representatives of 28 nations ratified Bretton Woods documents at Washington.

**28 General Motors** representatives quit Pres. Truman's fact-finding board declaring they were unable to co-operate as long as "ability to pay" was issue for investigation.

**1,500 persons** were arrested in Palestine by British authorities following terrorist outbreak, climaxed by bombing of police station in Jerusalem.

**29 Hitler's private will,** dated April 29, 1945, discovered by U.S. intelligence officers, said fuhrer married Eva Braun, his mistress, and then said both would commit suicide to escape "disgrace" of surrender.

**30 Hitler's political testament** disclosed that before his death he had expelled Hermann Goering and Heinrich Himmler from nazi party and government posts for "disloyalty," for secret negotiating with Allies and for "illegally" attempting to seize control of reich government.

**31 Sec'y of State Byrnes** said Gen. MacArthur's authority as supreme Allied commander would be preserved under four-power Allied control plan for Japan.

**National War Labor board** was terminated by Pres. Truman and supplanted by National Wage Stabilization board.

## BOOK OF THE YEAR

**Abrasives.** **United States.**—The salient production data on abrasives in the United States are presented in the accompanying table, supplemented by brief notes on general conditions with respect to the various commodities.

United States Production of Abrasives  
(In short tons, or as indicated)

	1941	1942	1943	1944
<b>Aluminous Abrasives</b>				
Corundum* . . . . .	5,765	?	?	?
Emery . . . . .	4,876	5,277	6,666	6,940
<b>Carbon Abrasives</b>				
Industrial diamonds, carats* . .	6,882,248	11,203,704	12,084,133	12,614,507
<b>Silica Abrasives</b>				
Quartz . . . . .	41,685	65,878	99,445	82,379
Sand (abrasive) . . . . .	1,001,814	806,878	837,662	897,983
Sand and sandstone (ground). .	487,665	527,886	541,350	558,606
Tripoli . . . . .	29,301	17,536	14,912	18,425
<b>Silica Stone Abrasives</b>				
Grindstones . . . . .	13,573	12,763	10,732	9,373
Millstones (value) . . . . .	\$15,579	\$10,391	\$9,240	\$9,700
Pulpstones . . . . .	1,963	1,918	1,891	?
Tube mill liners . . . . .	3,411	2,576	2,585	2,063
Grinding pebbles . . . . .	13,561	15,487	9,924	8,012
<b>Silicate Abrasives</b>				
Garnet . . . . .	5,501	4,357	5,935	?
Pumice . . . . .	117,310	126,522	85,150	88,757
<b>Artificial Abrasives</b>				
Silicon carbide† . . . . .	44,962	61,681	69,706	56,291
Aluminum oxide† . . . . .	147,759	183,633	217,425	185,573
Metallic abrasives† . . . . .	86,309	106,442	124,954	144,550

\*Imports; no domestic production. †Includes Canada also.

**Corundum.**—There was a small experimental output in North Carolina and Montana in 1943 and 1944, but no commercial output. The U.S. supply is imported from South Africa, but no

data were released after 1941. Demand for use in heavy grinding wheels and in optical lens grinding kept the supply short.

**Emery.**—Production in the Peekskill, N.Y., area increased to a new record high in 1944.

**Garnet.**—Figures for 1944 were not available for publication.

**Tripoli.**—Production increased sharply in 1944, both in quantity and value, with Illinois as the chief producer.

**Sand Abrasives.**—Ground sand and abrasive sand both increased in quantity and value in 1944, but crushed quartz declined.

**Stone Abrasives.**—Grindstones, pulpstones, grinding pebbles and tube mill liners all decreased in output in 1944, while millstones and sharpening stones increased.

**Artificial Abrasives.**—The 1944 outputs of silicon carbide and fused aluminum oxide declined, but that of metallic abrasives increased materially in 1944.

**Canada.**—There was only a minor production of abrasives in Canada, except for the various forms of silica. Quartz and silica sand declined from 1,776,749 short tons in 1943 to 1,740,262 tons in 1944. Other output included a few tons of garnet concentrate, 5 carloads of corundum concentrate, and 225 tons of grindstones.

**Academy of Arts and Sciences, American:** *see* SOCIETIES AND ASSOCIATIONS.

**Academy of Political and Social Science, American:** *see* SOCIETIES AND ASSOCIATIONS.

**Accident Insurance:** *see* INSURANCE.

**Accidents.** Accidental deaths in the United States based on figures for the first nine months of 1945, totalled 69,200. It was thought that if the trend for the last three months of the year would maintain the September average, the 1945 death toll would be at least as large as the 1944 total.

The nine-month motor vehicle accidental death total was 18,450, or a 9% increase over 1944.

Occupational accidental deaths through September totalled 12,600, or 700 below 1944.

Public nonmotor vehicle accidents accounted for 11,400 deaths during the first nine months of 1945, which was only 100 less than 1944's nine-month total.

Home accidents were responsible for 23,300 deaths during the nine-month period, or only 1% above the 1944 total.

Safety work throughout the nation in 1945 topped even the record expansion of the last full war year of 1944. Activities of the National Safety council and its affiliated state and community organizations continued to expand, along with the accident prevention efforts of industry, schools and government and private agencies of many kinds.

The 1945 National Safety congress, which is the focal point of annual national organized safety work, was cancelled because of wartime meeting and travel restrictions. Normally the congress attracts more than 10,000 delegates who represent every phase of the safety movement in all parts of the country.

AN EVACUATOR for emergency rescues, being demonstrated by firemen in Gary, Ind., in 1945. A seven-floor descent in the canvas chute averaged four seconds compared with two minutes by ladder

To offset the cancellation of the congress, the National Safety council distributed special newsletters containing summaries of materials which would have been presented at the congress, special reports, high lights of council activities and various educational materials. (*See also* DEATH STATISTICS; INDUSTRIAL HEALTH.) (R. L. Fo.)

**Traffic Accidents.**—As in virtually every phase of national life, 1945 was a critical year in the field of traffic accidents. The year began with the traffic system battered and war-weary. Cars and highways were run-down. Drivers, chafing under restrictions, were eager to go—when they could get enough gasoline.

January and February death figures were 14% and 8%, respectively, below those of the corresponding months in 1944. March showed a 2% increase, April and May 3% rises. In June, with victory over Germany a reality and the prospect of an increase in gasoline rations, the toll mounted 14% above that for the same month in 1944.

July recorded 15% more deaths than July 1944, and in August—the month of the atom bomb and Japanese capitulation—the toll jumped 30%. The September toll was up 40%, October 53% and November 40%.

At the end of 11 months, 25,200 persons were killed in street and highway accidents, an 18% increase over the same period in 1944.

The year's traffic toll was 28,500 deaths and approximately 1,000,000 nonfatal injuries, of which about 80,000 left some permanent impairment. The direct economic losses resulting from 1945 traffic accidents were estimated at \$1,450,000,000. This includes wage losses, medical expenses, overhead costs of insurance and motor vehicle property damage. The 1945 motor vehicle death toll of 28,500 was 17% greater than the total of 24,282 in 1944.

An outstanding effort to hold the traffic toll to a minimum, in spite of adverse factors, was the nationwide brake emphasis

program, conducted April 15 to June 1, 1945, by the International Association of Chiefs of Police. In the six-week period, the brakes of more than 1,880,000 motor vehicles were checked by police officers in the United States and Canada. In approximately one out of every seven cases, the vehicle's brakes were found to be defective.

With millions of decrepit vehicles still in use and only a trickle of new cars coming off assembly lines, with all restrictions off, 1946 traffic accident prospects were grim indeed.

Grand prize winners in the National Traffic Safety contest for 1944, conducted by the National Safety council, were Lansing, Mich., in the intercity section and Connecticut in the state section. Cities winning first place in their respective population groups were: Detroit (500,000 and more); Portland, Ore. (250,000 to 500,000); Ft. Wayne, Ind. (100,000 to 250,000); Lansing, Mich. (50,000 to 100,000); Greenwich, Conn. (25,000 to 50,000); and Stillwater, Okla. (10,000 to 25,000). A special award of merit was made to Milwaukee, Wis., for conspicuously low traffic death rates in 1944 and for sustained excellence in maintaining low death rates in previous years.

A special honour roll listed 158 cities with populations between 5,000 and 10,000 which went through 1944 without a traffic death. Forty-eight states and 1,350 cities were enrolled in the contest. Cities competing in the contest represented more than 90% of the urban population of the U.S.

The National Committee for Traffic Safety, formed in the fall of 1944 as an outgrowth of the National Safety Council's committee on Postwar Traffic Safety Planning, functioned in 1945 as a clearinghouse and co-ordinating agency for the 48 national organizations participating. Its primary purposes are to supplement and support the efforts of public officials and their associations, and to sponsor and conduct such projects as lend themselves to co-operative action.

The Public Education committee of the National Safety council traffic section produced three one-minute film trailers on pedestrian safety and one on winter driving hazards for showing in motion-picture theatres.

Police officers received training in traffic control and accident prevention in 1945 at the Northwestern University Traffic institute and the National Police academy of the Federal Bureau of Investigation. The Traffic institute annually conducts two four-and-one-half-month courses in traffic police administration and two three-week traffic officer training courses. The Police academy gives two weeks of traffic policing as a part of its 14-week course.

The National Institute for Traffic Training, conducted annually for seven years at universities and colleges in various parts of the country, was not held in 1945 because of travel restrictions. One-week training courses for motor vehicle fleet supervisors were given at the Northwestern University Traffic institute and at 16 other colleges and universities.

The extensive traffic police training activities of the safety division of the International Association of Chiefs of Police continued in cities where traffic survey and reorganization work was done. Surveys were made in Winnipeg, Manitoba, and Stockton, Calif. Follow-up work, a continuation of service where full-scale traffic program installations were made, was conducted in San Francisco, Indianapolis, Los Angeles, Oakland, Sacramento, Seattle, Portland, Ore., Minneapolis and Norfolk.

The traffic court program, sponsored jointly by the American Bar association and the National Safety council, held traffic court conferences throughout the country to promote better understanding between the traffic police and the judiciary. Driver training in high schools was stepped-up during 1945, as was motor vehicle inspection in cities and states.

The postwar federal-aid highway program, to provide \$1,500,-

000,000 in construction funds for state and local use during the first three postwar years, was made effective on Oct. 2 by congress, with the program made retroactive to the previous July 1. A quarter of the total must be spent in cities with more than 5,000 population, 30% on farm-to-market roads and the remaining 45% on federal-aid routes, rural or urban.

State highway departments reported some \$700,000,000 in completed project plans and nearly \$3,000,000,000 in plans under way by the year's end—not including an estimated 33% additional amount of local projects outside state-federal jurisdictions. Outstanding urban express highway projects, expected to get under construction in 1946, were reported in a number of large cities. New York City had fiscal and engineering preparations virtually completed for a \$285,000,000 five-year road program; Los Angeles, Chicago, Detroit, Pittsburgh and a number of cities in Texas and other southern states had similar major projects under construction or near the contract letting stage.

All state highway departments submitted official proposals for designation of their actions of the 40,000-mile National System of Interstate Highways as provided for in the postwar federal-aid road law, and the proposals were being reviewed by the Public Roads administration, with final action due early in 1946. This highway system was to pass through all cities of 300,000 or more population and through more than half of all cities with more than 10,000 population.

The joint committee on Traffic Engineering Functions and Administration, composed of representatives of the American Association of State Highway Officials, Institute of Traffic Engineers and American Public Works association, completed a guidebook on traffic engineering functions, stressing measures for efficient use of existing roads and streets, operating design features for new facilities and organization and administration of traffic engineering in city and state governments.

The Joint Committee on Revision of the Manual on Uniform Traffic Control Devices, representing the American Association of State Highway Officials, Institute of Traffic Engineers and the National Conference on Street and Highway Safety, completed its revision of the devices manual, which was to be used by the states in enforcing a provision of the new federal-aid road act requiring uniformity of traffic controls on routes receiving federal-aid funds.

Such wide public attention to traffic dangers resulted from the brake check program of 1945 that the International Association of Chiefs of Police decided late in the year to conduct an even more extensive program in the spring of 1946. This was to be known as the Police Traffic Safety Check. Every time a traffic officer stops a motorist for a moving violation, he will, in co-operation with the driver, check the vehicle's brakes, horn, windshield wiper, lights, tires and any other parts of the car with obvious defects, as a means of focusing attention on the need for car and driving care.

Executive cognizance of the rising traffic accident toll was taken in December when Pres. Truman called a national traffic safety conference for the spring of 1946. (See also DISASTERS.)

FILMS.—*First Aid; Safety in the Home* (Encyclopædia Britannica Films Inc.). (R. E. RH.)

**Acheson, Dean Gooderham** (1893- ), U.S. government official, was born April 11, in Middletown, Conn. He graduated from Yale university, 1915, and received a law degree from Harvard three years later. He served as a naval ensign in World War I, and later became private secretary to Louis D. Brandeis, associate justice of the U.S. supreme court. He practised law from 1921 to May 1933, when he was appointed undersecretary of the treasury, a post which he resigned later that year to return to

his law practice. In Feb. 1941 he was appointed assistant secretary of state, and with the formation of the United Nations Relief and Rehabilitation administration in 1943, Acheson became the U.S. member of its council. After the resignation of Joseph C. Grew, Acheson was named (Aug. 16, 1945) to succeed him as undersecretary of state. On Sept. 19, Acheson obliquely criticized Gen. MacArthur, by stating that the U.S. government, not the occupation force, would determine policy in Japan. This statement caused a minor furore among some MacArthur supporters in the senate and touched off sharp debating. Acheson, however, was confirmed as undersecretary, Sept. 24, by the senate, 69 votes to 1.

**Act of Chapultepec:** see INTER-AMERICAN CONFERENCE ON PROBLEMS OF WAR AND PEACE; PAN AMERICAN UNION.  
**Actors and Acting:** see THEATRE.

**Adams, Herbert** (1858-1945), U.S. sculptor, was born Jan. 28 at West Concord, Vt. For his earlier career see *Encyclopædia Britannica*. He is noted especially for his portrait busts of women; he also executed a number of public commissions, including statues and bronze doors for the Library of Congress in Washington. He died in New York city, May 21.

**Aden.** Aden is a British colony, seaport and territory in southwest Arabia, 12° 47' N. and 45° 10' E., including Perim Island, in the strait of Bab-el-Mandeb between Africa and Arabia; area 80 sq.mi.; pop. (est. 1939) 65,000. Aden protectorate, including Socotra in the Indian ocean, 112,000 sq.mi.; pop. (est.) 600,000. Governor (1945): R. S. Champion. Language: English and Arabic; religion: predominantly Mohammedan.

In Feb. 1945, Alan Logan Kirkbride was appointed chief-secretary, in succession to R. S. Champion, who became governor of Aden. The Colonial Development and Welfare act, 1945, allocated £800,000 to Aden until 1955.

**Finance.**—Revenue (est. 1945-46) \$2,801,800; expenditure (est. 1945-46) \$2,265,900; currency, legal tender rupee (Rs. 1) = 1s. 6d. = 30.12 cents U.S. in 1944.

**Trade and Communication.**—External trade 1939 (merchandise and treasure on private account): imports, by sea \$17,357,100; by land \$682,800; exports, by sea \$10,131,600; by land \$663,600; (treasure) imports \$810,300; exports \$606,900. Communications: shipping (1939) 2,004 merchant vessels (1,300 British) entered, total tonnage 8,005,763 net tons; motor vehicles registered (Sept. 30, 1939) 733 cars and taxis, 207 commercial vehicles.

**Production.**—In 1938-39, tobacco (approximate value of crop) \$165,000; salt (export) 273,622 short tons; coffee (export 1939-40) 6,160 short tons.

**Adult Education:** see EDUCATION.

**Advertising.** United States.—With the end of World War II in both the European and Pacific theatres during 1945, advertisers made plans to forge ahead in every direction. Huge postwar budgets were appropriated, groundwork was laid for numerous research studies and general expansion programs were voted as a key to prosperity for U.S. business. Many industries emerged from reconversion with practical advertising campaigns in full swing. With the transition from war themes to selling copy, advertising expenditures materially increased, limited only by space and network time available. Many new magazines appeared during the latter part of 1945,

"Hello Mom, It's Me!"

AMONG THE 100 advertisements adjudged to have contributed most to the war effort in 1945 was this advertisement prepared for the Bell Telephone system. Awards, made on Nov. 1, 1945, replaced for the duration of the war the former choice of a "best" advertisement for the year

and plans were laid for additional publications within the first few months of 1946. In general, the War Production board released more paper for magazines, newspapers and direct mail.

Total advertising expenditures were approximately \$2,400,000,000 as compared with \$2,270,000,000 in 1944, about 1.5% of national income. During the 1920s it was 3% and in the '30s, between 2% and 3%.

The year was marked by substantial increases in magazine and outdoor advertising and moderate increases in newspaper and farm paper volume. In the first nine months of 1945, as compared with the corresponding 1944 period, business paper advertising gained 13.4%, industrial magazines, 11%, trade publications, 25.5% and the export group, 18.7%. Radio retained about the same volume as in 1944 due to long-term contracts for preferred listening hours on principal networks.

Although government restrictions on use of paper were removed, lack of paper, printing equipment and personnel held down the volume of publication advertising. Heavy institutional and industrial advertising continued during the year, with a generous contribution of space going to government activities.

American business contributed to the war effort more than \$1,000,000,000 of advertising space and time in three-and-a-half years. It participated in more than 100 home-front campaigns in co-operation with 27 government departments and agencies, informing the nation about war bonds, armed forces, V-mail, merchant marine, civilian nurses, food rationing, salvage and civilian services. Business contributed an estimated \$350,000,000 in advertising space and time in support of war bond promotion alone.

The army recruiting service launched a \$4,000,000 national advertising campaign with copy stressing re-enlistment to retain existing grades. All leading media were used. Sales of surplus property also were widely advertised.

Increased use of shopping newspapers by advertisers was apparent during 1945. Many new classes of products were introduced, such as automotive, motion pictures, fuel oil, banks, paints and hardware. Dominant classifications were groceries, drugs and wearing apparel.

Conscious of postwar competition for industries and tourist trade, 32 states appropriated \$5,177,054 for advertising during 1945 and 1946. Media included magazines, newspapers, mailing booklets, motion pictures and radio. Florida and Kansas voted the largest budgets, amounting to around \$1,000,000 each. Privately owned utilities also stressed in advertising merits of individual cities as industrial and trading areas. Banks likewise employed community promotion themes.

Approximately 1,000 banks co-operated with household appliance manufacturers in financing retail sales of products. With the end of war and victory loan drives, bank advertising shifted appeals to specific services and consumer credit.

Due to the war's end, steamship companies resumed national advertising. Skywriting as an advertising medium was resumed. Contracts were signed with leading advertisers and plans made for skywriting in colours and luminous inscriptions for after-dark writing. Arrangements to extend services to Canada and Latin America were undertaken.

The National Safety council and Advertising council arranged for a major campaign with themes stressing industrial, home and farm safety. This had the fullest co-operation and sponsorship of advertisers and media.

To stimulate interest in advertising, 59 advertising clubs sponsored advertising courses. Half of these clubs co-operated with educational institutions and many offered scholarships.

Strikes in industry near the end of 1945 resulted in cancellation by several leading manufacturers of all cancellable advertising originally scheduled for the remainder of 1945 and early part of 1946.

After V-J day, the War Advertising council changed its name to the Advertising council and continued its efforts in peacetime programs by taking over the administration of pooled media facilities formerly handled by the Office of War Information. All branches of advertising continued financial support to the council.

**Copy and Layout.**—The end of rationing and restrictions provided opportunities for more campaigns by manufacturers previously limited by shortages of materials. Institutional copy was replaced by straight selling themes in most instances.

Some experimenting was done in the use of comic copy in standard publications. Fewer sidewise advertisements appeared. In general, practically no departure from usual copy or layout treatment was noticeable.

**Magazines.**—Although operating under the same paper restrictions as in 1944, magazine advertising increased during 1945 to more than \$300,000,000, as compared with \$271,000,000 for 1944. An outstanding accomplishment was the promotion of Seventh War Bond sales through more than 3,000 cover displays and full-page advertisements donated by magazines and advertisers. Magazines continued to co-operate with the government on all war effort and peacetime programs including the Economic Stabilization campaign.

A number of new magazines appeared during the year in various fields, such as foods, drugs, radio and travel, as well as publications with appeal to the younger generation. Plans were laid for publishing many others during 1946.

**Newspapers.**—Newsprint continued scarce in 1945, with consumption controlled by government order. Some newspapers rationed circulation and advertising to keep within supply. Threats that newspapers might be forced to suspend publication were overcome through co-operating with regional, state and

city newspaper associations. Restricted consumption of newsprint, however, was revoked on Dec. 31, 1945, but the Civilian Production administration continued control of newsprint inventories. Circulation rose to an all-time high during 1945. Prices were also advanced in some cases.

Continued efforts to conserve newsprint were realized by streamlining Saturday editions to six or eight pages, reducing margins, restricting circulation, eliminating less essential features, drastically cutting size of display and classified advertisements, putting pressure on advertisers for optional insertion dates and publishing fewer editions. In spite of wartime restrictions, newspapers continued to provide comprehensive coverage of international, national and local news. Little reduction was made in news content, publishers preferring to omit advertising when necessary to provide space for news coverage.

Newspapers continued to support more than 50 government war and reconversion projects through editorial columns and advertising. From Aug. 1943 through July 1945, war effort advertising in U.S. daily and Sunday newspapers totalled \$98,813,358, averaging more than \$4,000,000 a month. Top four projects were war bonds, \$42,597,445; Red Cross, \$6,252,678; armed forces recruiting (sponsored) \$5,133,385; waste paper and salvage, \$4,453,725. Total paid advertising, with exception of war bonds, was \$51,874,543; donated by newspapers, \$4,341,370.

There was an increased use of classified advertising by veterans seeking jobs and living quarters, newspapers making special efforts to highlight this advertising for reader attention.

Newspapers formed an organization composed of representative daily and Sunday papers throughout the United States to promote greater use of newspapers generally in competition with other national media. National advertisers were offered the advantage of group rates for market coverage by regions

ADVERTISEMENT prepared for Carstairs Bros. Distilling Co., Inc., received an award on Nov. 1, 1945, as one of the 100 most outstanding wartime advertisements of the year. The appeal was for employment of returning veterans

## Have you any use for a hero?

He's won. He's safe. And now he's coming home.  
Yesterday came the order: "Come home." The war was ended.  
He couldn't believe, for a while, that that was really it.  
Then he felt a wild elation that somehow attended the  
hump in his throat unmaned by a sudden homesickness  
... for Main Street, kind with Saturday shoppers.  
For Mom.  
And Pop, and the bathroom shower at home that always  
dropped a bit. Funny, what little things get you sometimes—  
a tough soldier like him!  
Sure, he was tough. He'd looked inside the doors of Hell  
plenty times—and kept coming.  
He'd taken everything these Krauts and Japs could dish out—  
and there back too for one small day cracked  
But now the gun in his hands feels strange.  
All of a sudden, it doesn't seem natural.  
Like a former holding an anchor.  
And that same gun had been like his right hand  
up to that last wonderful command.  
But now he's going home, too?  
Home?  
A girl's no good there.  
A witch, a sow, a plover—they're good.  
Because that born stuff is going to fade.  
A fellow's got other things to face  
besides death.  
Like buying food and clothes.  
And getting married, or living the mortgage.  
That doesn't take a gun.  
It takes a job.  
It kind of scares him to think maybe there won't be  
a job. Maybe he's outgrown his pro war role  
with Old Man Jones—or maybe Jones & Co.'s  
business will be shut  
and they can't use him.  
Then what?  
After the Victory parades and the speeches,  
he'll be just another guy in civvie.  
But where'll he wind up without a job?  
Yeah, you know. On the town.  
Say, could that be it? That bloody business has been carrying  
him? Is that all he's going to put out of three years in hell?  
Wasn't a minute? Take it easy.  
The kids back home said they knew he was fighting  
for them, trying his life on the line to let them live  
the way Americans have to live.  
They swore they were grateful.  
Do they really mean it?  
On they understand his job is done,  
that now it's their turn?  
Are they going to fight for him now?  
Are they really thinking and planning and acting  
on ways to let him make a living when he gets back?  
He hopes so.  
Oh, how he hopes so!

CARSTAIRS BROS. DISTILLING CO., INC.  
405 Lexington Ave., New York 17, N.Y.

NEWSPAPER ADVERTISING (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

or the entire U.S., selling each group of newspapers as a single unit. Likewise, in a bid for a larger share of advertising, the Weekly Newspaper bureau of the National Editorial association was created to improve weekly newspapers through better business practices involving advertising problems. (See also **NEWSPAPERS AND MAGAZINES**.)

**Radio.**—For the first eight months of 1945, estimated combined gross time sales of the four coast-to-coast networks gained only a fraction of 1% over the corresponding period of 1944—\$124,499,904 as compared with \$123,922,092—due to carry over of long-term contracts from the preceding year for best day and evening hours. The Advertising council continued, on a revised basis, the radio network allocations set up during war years. (See also **RADIO**.)

**Direct Mail.**—Because of restrictions, direct mail selling volume shrank during the early part of 1945. Near the end of the year, however, printers were jammed with work covering new catalogues and printed promotion of all kinds.

A two-year study of direct mail pieces, catalogues and technical books showed that illustrations, layout, copy and physical size of mailing pieces influence the reading by recipients and indicate that the effectiveness of direct mail is strictly up to advertisers. Among executives, 63% preferred small mailing pieces while 95% of the purchasing agents interviewed liked uniformity of size in catalogues.

At the close of the year, the Graphic Arts Victory committee ceased to function, having successfully completed its purpose of putting printing, lithography and all devices of the graphic arts to the job of helping the war effort. Millions of printed promotion pieces devoted to war and victory campaigns proved their usefulness in the war program.

**Point of Purchase.**—More importance was given this medium during 1945 than formerly, occasioning decided gains. Certain classes of advertisers tremendously increased their point of purchase and display advertising, ranging from 3% to 6% for some types of business to 17% and 18% for others. Many advertisers recognized the value of the medium, including it as a definite part of their advertising budget. Some of the largest advertisers used display as a leadoff in introducing national campaigns. Exhaustive research studies were started to bring about improvements in the medium.

**Transportation.**—Volume of transportation advertising was around \$16,500,000 in 1945, a substantial gain over the 1944 figure. Transit riding reached an all-time high, exceeding 23,000,000,000 passengers. The first ten months of the year showed an increase of 1.91%, but dropped 2% to 4% during the last two months, due to suspension of wartime gas restrictions.

Because of the end of World War II, the Transportation Advertising War Campaigns pool was discontinued, but 50,000 car card spaces per month were given to the Advertising council for peacetime public service campaigns.

**Outdoor.**—Lifting of dim-out regulations and the end of gasoline rationing stimulated renewed interest in this medium, resulting in an increase of 40% in national advertising volume in 1945 over 1944. A greater part of this growth came from automotive and accessories fields.

A shift from wartime institutional copy and colours was noticeable toward the end of the year. Advertisements dealt directly with products giving brand names more prominence.

According to the Traffic Audit bureau figures released in the fall of 1945, effective circulation of outdoor advertising in 206 cities was 23% greater than at the time of last previous audits during 1938 to 1942. Wide variation existed, however, within geographical sections due to sudden contract cancellations, layoffs, migration of workers and resumption of heavy traffic on through highways resulting from the end of war.

**Retail.**—During the first nine months of 1945, advertising volume for food chains showed a slight downward trend; drug chains remained practically the same, while variety and miscellaneous chains were up 4.3%. Mail-order houses were slightly ahead of 1944 despite catalogue and other troubles.

Although inventories were low, war-prosperity buying pushed department store sales to peak levels. Much retail advertising space was devoted to converted surplus government merchandise, including wearing apparel as well as household and sports items.

A survey conducted by *Television* magazine found that 49% of department stores endorsed television as an effective advertising medium, while 14% did not, and 32% were awaiting future developments. Among customers, 82% were able to name merchandise shown in television demonstrations.

**Consumer.**—Numerous studies were made during 1945 to test consumer reactions. One conducted by the Committee on Consumer Relations in Advertising, Inc., showed that all media of advertising materially increased their informational content to consumers on the proper use of products. This was the result of demands made by the public for reliable and adequate information. In surveys made for Brand Names Research foundation, it was overwhelmingly shown that consumers prefer to buy by brands. Indifference to brand names averaged 26.6% for men as compared with 19.1% for women. Items covered were foods, wearing apparel, toilet goods, hardware and personal articles.

A study of sales influences of endorsements and stamps of approval as an advertising device, showed that 62.4% of the women favoured these endorsements.

With the relaxing of controls on DDT distribution, some misleading advertising of products containing the chemical occurred. The department of agriculture curbed this practice and printed its own report on tested DDT insecticides for agriculture and the home and their proper use.

By unanimity reached among both canners and distributors on descriptive labelling techniques, additional product information was to be given on food labels. New U.S. Food and Drug administration labelling regulations went into effect, relating to packaged medicines safe for self-medication, and those unsafe without a doctor's supervision.

**Research.**—Increasing numbers of studies were made by research organizations, manufacturers, publishers and advertising agencies in the various fields of marketing and advertising, including studies on use of products in selected areas, panels of users and observation and reading of advertising. The obtaining of factual information was expanded materially during 1945 and business operations were increasingly determined in the light of research results.

The Pacific Advertising association sponsored a program covering fundamental economic conditions which provided a post-war outlook for marketing and a background for market planning in the west.

**Foreign.**—The general over-all world picture presented unprecedented demands for advertising space which was not available because of paper shortages. British newsprint remained tight, newspapers using 290,000 tons during the year, compared with 1,100,000 before the war. Magazines used 25,000 tons whereas formerly it ran to around 78,000. London newspapers were on a four-page daily and eight-page Sunday basis while Paris dailies had two pages with greatly restricted advertising space.

Insertions in British magazines were rarely larger than one-quarter page and colour had disappeared completely. Direct mail was drastically cut; no catalogues or brochures of any type could be sent out without specific permission. Due to lack of other media, outdoor advertising boomed.

Up to June 30, 1945, 20 large Australian metropolitan newspapers had gained 26.2% in advertising lineage over a corresponding period in 1944. Newsprint was still scarce although a slight easing occurred toward the end of the year in some states. Maximum amount of space that could be purchased by advertisers in metropolitan dailies was 8 in. x 2 columns, and in most instances it was 5½ in. x 2 columns. Classified and retail advertising headed the list in metropolitan dailies, classified totalling 1,261,869 in. in 1945 as compared with 1,029,966 in. in 1944. Retail in 1945 was 499,410 in. against 378,966 in. in 1944.

Canadian advertising volume remained about the same because of the paper situation, while Latin American volume increased greatly in spite of paper difficulties. The foreign editions of *Readers' Digest* had moderate advertising volume increases. Although demands were great, space was limited.

Because of world-wide paper shortages, use of motion pictures as an advertising medium increased enormously. This was found to be the case in foreign countries by an even greater extent than in the U.S.

**Afghanistan.** A Moslem kingdom lying between India and Iran; area 250,000 sq.mi.; pop. (est. 1940) 10,000,000; chief towns: Kabul (cap., 80,000), Kandahar (60,000), Herat (50,000), Mazar-i-Sharif (30,000). Ruler: Mohammed Zaher Shah; languages: Persian, Pushtu, and some Turki in the north; religion: Mohammedan.

**History.**—There was little change in internal affairs during 1945, the 26th year of Afghanistan independence. Shah Zaher continued a peaceful rule and the end of World War II saw an unbroken record of neutrality for the country. The Red Crescent Society of Afghanistan donated £5,000 in July to the fund opened by the International Red Cross at Geneva as a token of its sympathy with the fate of European peoples. During the year, Eli E. Palmer, formerly with the foreign service at the Australian embassy, succeeded Cornelius Van H. Engbert as

U.S. minister at Kabul.

**Education.**—Confined chiefly to Kabul. Elementary schools exist throughout the country, but secondary schools exist only in Kabul and provincial capitals. Both are free. There were, in 1940, 130 primary schools and 1 normal school for teachers in Kabul. In addition there were 4 secondary schools and 13 military schools. Technical, art, commercial and medical schools exist for higher education. The Kabul university was established in 1932; only a medical faculty existed in 1940.

**Defense.**—Army, compulsory service; peace strength 90,000.

**Finance.**—Revenue and expenditure about \$45,000,000; currency: Rs.3.95 (Afghan)=Rs.1 (Indian)=30.12 cents U.S. (July 1943).

**Trade and Communication.**—(1939-40) Exports to India: Afghan merchandise \$1,195,000; treasure \$5,020; non-Afghan merchandise \$605. Imports: Indian produce \$2,188,000; other produce (imported through India and in transit) \$5,910,000. Persian lambskin is one of the most important exports. Other exports are carpets, fruit, wool and cotton. Roads: trade routes, Kabul to Peshawar (India) 210 mi.; and Kandahar to Chaman, 70 mi.; there were about 2,265 mi. of unmetalled roads connecting the chief towns. At the beginning of 1941 there were five wireless stations in the country.

**Agriculture.**—Wheat, rice, millet, maize, sheep, Persian lambskin, wool (1938) 7,480 short tons.

**Agagianian, Gregorio Pietro XV** (1895— ) Patriarch of Cilicia of the Armenians was born at Akhaltsikh, Caucasian Armenia, on Sept. 15. He studied and taught at the Propaganda Fide in Rome. He was ordained in 1917. Appointed vice-rector of the Armenian college at Rome in 1921, he was named rector in 1925 and titular bishop of Comana in 1935. He was elevated to patriarch of Cilicia in Armenia in 1937.

He was the highest ecclesiastical dignitary among the 32 the Holy Father named for elevation to the Sacred College of Cardinals.

Many members of the U.S. clergy, some of whom were elevated to the episcopate, studied under the patriarch at the Propaganda Fide. He was a former classmate of Cardinal-designate Francis J. Spellman in Rome. Pope Pius X once said to the patriarch in his pre-seminary days: "You will be a priest, a bishop and a patriarch." He was created and proclaimed a cardinal at consistory on Feb. 18, 1946.

## Agricultural Research Administration.

An agency of the United States department of agriculture established in 1941 to direct and co-ordinate research in the department, the ARA comprises seven bureaus whose functions are for the most part the conduct of research. These are: bureau of agricultural and industrial chemistry, bureau of animal industry, bureau of dairy industry, bureau of entomology and plant quarantine, office of experiment stations, bureau of human nutrition and home economics and bureau of plant industry, soils, and agricultural engineering.

Experiments with DDT in 1945 indicated it would be useful on the farm and in the orchard as well as around the home and barn. Tests showed that it gives satisfactory control of Japanese beetles, Colorado potato beetles, potato leaf hoppers, tomato fruit worms, pea weevils and certain other crop insects. It did not give satisfactory control for Mexican bean beetles, several aphids and common red spiders. It gives satisfactory control for squash bugs and other insect enemies of squash but is harmful to the plants. Experiments were to continue in 1946 and definite recommendations were to be available for using DDT against a particular pest of field and garden crops as soon as the results warranted. In making recommendations, due consideration would be given to poisonous residues that might remain on the food of man or animals.

Entomological research in 1945 also developed valuable new information on the application of insecticides. Formerly, the use of liquid insecticides required the distribution of large quantities of water which merely served as a carrier for the active ingredients. With the advent of DDT new types of distributors which break up the spray into very fine droplets were developed for the dispersion of this insecticide in solutions or emulsions. Entomologists found that these give good coverage on certain types of foliage with as little as .1 gal. of spray per acre. This new equipment made it practical to apply insecticides in liquid form from aeroplanes, a practice which had not formerly been used to any extent because of the large amount of water required in the spray.

Aeroplanes for applying insecticides had been in use for many years principally for dusting cotton in the delta region and in the southwest, where fields are large. Further work in 1945 pointed to other possible uses in Washington and Oregon of aerial applications of dusting mixtures containing DDT or rotenone that gave good control of weevils on peas. In Arizona, satisfactory results were recorded in using aeroplanes to apply dusts containing DDT for the control of *Lygus* plant bugs and beet leaf hoppers on sugar beets grown for seed. In North Carolina, aeroplane application of cryolite dust mixtures controlled hornworms and flea beetles on tobacco. Preliminary tests in which both DDT and rotenone were used indicated that effective insecticidal control of the European corn borer could be obtained with aerial equipment.

Marked progress was made in the development of equipment and formulas for dispersing insecticides in the form of fogs or aerosols. The aerosol bomb, which disperses the insecticide by the pressure of liquefied gas, was extensively used during World War II to protect troops from disease-carrying insects. This device promised to be a popular method of combating mosquitoes, flies and other free-flying insects in buildings.

Entomologists and plant breeders had been working jointly for several years to develop strains of commonly grown field crops that were resistant to insect attacks. Additional lines of corn resistant to the European corn borer were discovered in 1945, and those previously found were being utilized as breeding material by state and federal plant breeders. A strain of dent corn known as R-30, resistant to earworms, was being used

in commercial crosses, and a strain of sweet corn also showed resistance to this pest. In California, two strains of wheat resistant to hessian flies were being increased for release to growers. Considerable progress was also made in breeding cotton resistant to aphids, without lowering yield or quality of lint. Plant breeders also developed many new varieties more resistant to diseases or otherwise superior. Those made available to farmers in 1945 included barley, cantaloupes, corn, crimson clover, lettuce, millet, oats, onions, potatoes, tomatoes and vetch. (See also ENTOMOLOGY.)

New varieties of oats developed co-operatively by the department of agriculture and several state experiment stations had practically replaced older varieties in the north central states. A still newer variety, Clinton, that outyielded all others in 1945 was to be available for planting in the spring of 1946. It is resistant to rusts and smuts and has a very stiff straw, an advantage in harvesting.

Experiments with growth-promoting chemicals at the plant industry station in 1945 resulted in a discovery of great importance in weed control. One of these chemicals, 2,4-dichlorophenoxyacetic acid, was found to be deadly to certain plants when applied to the foliage as a spray solution in the very low concentration of one-tenth of 1%. If preliminary results were confirmed in larger scale tests, weeds that could be destroyed only at great expense might be eradicated at a mere fraction of former cost in terms of labour and money. Tests had already shown conclusively that 2,4-D would control some of the common lawn weeds without injury to Kentucky blue grass. A single spray with 2,4-D at a cost of less than \$5 per acre destroyed nearly 100% of dandelion, buckhorn, wall pennywort and other broad-leaved weeds. Much more information was necessary, and thousands of experiments were in progress throughout the United States.

The light sandy soils commonly found in the southeastern states and along the Atlantic seaboard usually respond quickly to applications of nitrogen fertilizers. As a result, it has been common practice to apply fertilizers containing nitrogen in this region. Tests during 1944-45 with corn in North Carolina showed that much larger applications of nitrogen might be profitable to farmers. By adding 120 lb. of nitrogen per acre, in addition to the fertilizers customarily used, the yield of corn on one farm was increased from 19 bu. per acre to 107 bu. per acre. This increase of 88 bu. of corn was obtained at a cost of approximately \$12 for the extra nitrogen used. Soils specialists of the department and the North Carolina agricultural experiment station believed that these experiments pointed the way to doubling corn yield in the southeast, which averaged about 20 bu. per acre. Another factor which was expected to aid in reaching this goal was the progress in development of hybrid corn adapted to the south.

Consumers prefer fresh eggs with a high percentage of thick white, because such eggs stand up well and do not have a watery appearance. Research in the department showed that it was possible to develop by breeding a strain of chickens that produced eggs with a higher percentage of thick white. It was also found possible to develop strains that laid eggs with stronger shells. Such eggs keep better under poor storage conditions and lose less weight under good storage conditions. Also, fewer eggs are broken by handling. It was also possible to reduce the number and size of blood spots in eggs by selection and breeding.

Tests to determine the effectiveness of penicillin against animal diseases were encouraging. The drug was fairly effective in controlling the principal organisms causing mastitis in cattle. Further investigations were under way in 1945, and it was thought possible that penicillin might be found useful against

other infective diseases of animals, though it would not, of course, eliminate the necessity for sanitary precautions.

Feeding dairy cows a larger proportion of their total grain ration during the first third of the lactation period increased milk yield by 10% in experiments at three stations of the bureau of dairy industry. The control groups received grain at a uniform rate throughout the lactation period. The greatest difference in yields was during the first part of the period, when milk production is normally greatest. An increase in milk production with the same amount of feed would obviously be profitable to dairymen.

A dried meal made from vegetable wastes that accumulate in large quantities at processing plants showed considerable promise as a poultry feed. Leaf meal made from broccoli compared favourably with alfalfa meal in a test by the Delaware agricultural experiment station.

Studies by the bureau of human nutrition and home economics, supplementing earlier work on soybeans, peanuts and cottonseed, showed that wheat germ and corn germ rank first and second, respectively, among plant sources of nutritionally efficient protein. Moreover, they could probably be made available in large quantities in a form suitable for human consumption. It was estimated that 55,000,000 lb. of wheat germ alone were being produced every year in the United States and Canada. Specially processed and defatted wheat and corn germs that had excellent keeping quality were being prepared commercially for human use in 1945.

Notable improvement in the flavour of canned orange and grapefruit juice was expected to result from work at the U.S. department of agriculture Citrus Products laboratory at Winter Haven, Fla. Canned citrus juice tends to have a cooked taste. It was found that a product with improved flavour that more nearly resembled the fresh product could be made by improving the method of pasteurization and by canning the juice under a vacuum. Storage tests were in progress to determine how long the canned juice could be stored without loss in quality.

(P. V. C.)

**Agriculture.** Another year of high total agricultural production was recorded for the United States in 1945. While the total volume did not quite equal the all-time high record of 1944 it was above all other previous years. The index of total production in 1945 was estimated by the U.S. department of agriculture to be 130 (1935-39=100) compared with 133 for 1944, 129 for 1943, 125 for 1942, 113 for 1941 and 110 for 1940. Crop production in 1945 was the third largest on record, being 2% less than the high total of 1942 and 4% below that of 1944. Livestock production registered the principal decline after passing the peak in 1944. Breeding hogs declined 28% in 1944, and the pig crop of 1945 was not sufficient to make up the difference. While the output of milk reached a new record in 1945, it was not sufficient to offset the decline in other lines.

Table I.—Index Numbers of the Volume of Agricultural Production through Two War Periods\* (1935-39=100)

	1915	1920	1925	1930	1935	1940	1942	1943	1944	1945

\*From estimates by the bureau of agricultural economics, U.S. department of agriculture.

"NEAT TRICK IF HE DOES IT" commented L. J. Roche of the *Buffalo Courier-Express* on the task facing Clinton P. Anderson when he was appointed U.S. secretary of agriculture on May 23, 1945

This was the eighth successive year of agricultural production accompanied by relatively favourable weather. There was no general drought, flood or other crop disaster to reduce the output. This remarkable period of years of bountiful crops coincided with the period of the greatest war need to the benefit of the U.S. and other nations. Had average weather of the previous three decades been experienced the record would have been far less impressive.

**Crop Production.**—Total 1945 crop production proved to be the third largest on record, although several crops surpassed previous high totals. The record-breaking crops in 1945 were: wheat, oats, tobacco, rice, popcorn, hops, peaches, pears, grapefruit, almonds and truck crops for the fresh market. Other crops that were very near the high record were: hay, soybeans, flaxseed, potatoes, sugar cane, oranges, grapes and pecans. Of the major crops that were near to the top, corn and peanuts were important. The only severe declines to be recorded were apples, cherries, maple, beans and sweet potatoes. The cotton crop was the smallest after 1896 except for 1921.

The acreage of 52 crops harvested in 1945 was 346,900,000 ac., only about 4,000,000 less than the total of 1944. This acreage was not a record since in the 1928-32 period the farmed area reached from 351,000,000 to 362,000,000 ac. The reduction occurred in the Atlantic and south central states where the reduction was 15% from the high peak of 1931. This total was increased in the north central and western states. A much larger acreage would have been planted had the wet spring not intervened. There was some shift from row crops to grains due to the shortage of labour and the desire to make the best use of tractor machinery. The total acreage losses due to floods, droughts and frosts for 16 crops amounted to only about 10,000,000 ac. which was the smallest loss in any year after 1930. The worst loss was that of apples and sour cherries caused by the frosts in late spring. Crop yields were generally high in 1945, only 2% below 1944 and 4% below the record of

1942. Composite yields were 30% above the 1923-32 period and several crops made new high records.

Food grain production was the highest on record including wheat, rice, corn and oats. The feed grains total was also almost up to the record. Sugar production from cane and beets was estimated to be about 23% above 1944. Oilseeds as a whole yielded a large total, although the cottonseed output was small. Fruits were less abundant but vegetables and truck crops made new high records and victory and other home gardens gave excellent returns where they were well cared for.

Table II.—Production Figures of Selected U.S. Crops, 1933-45

(000s omitted)								
Year	Corn bu.	Oats bu.	Wheat bu.	Cotton bales	Timothy tons	Rice bu.	Tobacco lb.	Potatoes bu.
1933	2,399,632	733,166	551,683	13,049	66,530	37,651	1,371,131	342,306
1934	1,461,123	542,306	526,393	9,636	55,270	39,047	1,081,629	406,105
1935	2,303,747	1,194,902	626,344	10,638	78,138	38,784	1,297,155	386,380
1936	1,507,089	785,506	626,766	12,399	63,536	49,002	1,154,131	331,918
1937	2,644,995	1,146,258	873,766	18,946	73,785	53,364	1,553,405	393,289

The corn crop of 1945 was the third 3,000,000,000 bu. production in succession, only about 180,000,000 bu. less than was produced in 1944. The harvested acreage was about 5% less than in 1944 and the average yield slightly larger. The season was favourable for vigorous growth but early frosts in the fall caused a large loss, about 12%, from "soft" corn. The increasing use of hybrid seed produced high yields in Indiana, Illinois and Ohio, leading corn-producing states. Production in Iowa declined because of lower yields. Wheat production made another high record exceeding the record of 1944 by 6% or 51,000,000 bu. The increase of 10% in acreage more than offset the lower average yield. This increase was all in winter wheat amounting to more than 6,000,000 ac. and the yield on this class of wheat was almost up to that of the previous year. The surplus of wheat, so large in 1942 and 1943, was reduced to more than normal relations to demand, and the big crop was needed for relief purposes. Grains other than wheat and corn returned a big harvest in 1945. Oats made a new record, nearly 50% above the prewar average. Rye production was above that of 1944 although much below the prewar level.

FRESH TOBACCO from the 1945 crop in Georgia being strung before curing

Barley was below the average and a little below 1944. Rice made another new high record in 1945 over that of 1944.

Tobacco production reached a new all-time record in 1945. More than 2,041,811,000 lb. of all types were harvested due chiefly to favourable harvesting weather. The acreage was increased 4% and yields were above average. Flue-cured and burley were the types that made the great increase.

The cotton crop of 9,195,000 bales of 500 lb. from 18,000,000 ac. was 18% smaller than that of 1944. The yield was off 9% and the acreage 12% less. For the fifth year U.S. farmers produced a cotton crop which returned in the market more than \$1,000,000,000. The return in 1945 was smaller than any of the past three seasons but larger than in 23 of the past 36 years.

Potato production in 1945 was larger than in 1944 and above the average. The good crop was due to a new record yield of 150.6 bu. per acre compared with the previous record of 139.6 bu. per acre. Dry beans returned the smallest crop after 1936 due to the unfavourable season. Soybeans yielded the third largest crop on record. Peaches made a new all-time record, 6% above 1944 and 50% above the ten-year average. One of the few crop failures was maple products which suffered from the unseasonably warm weather early in the year followed by cold which prevented sap gathering.

Pastures and hay meadows gave an abundant supply of live-stock feed through 1945. Hay production was almost equal to the record crop of 1942. Total fruit production was above average though about 4% below 1944. Apples were short in the eastern areas. Commercial truck crops returned a record tonnage.

**Livestock Production.**—The decline in total numbers of live-stock on U.S. farms which began in 1944 continued through 1945 at an increasing rate. In terms of animal units of comparative size the total number had declined 6% by Jan. 1, 1946 from a year earlier but was still larger than any other of the last 20 years except 1943. The total value also was about 7% below 1944 and 8% less than the record of 1943. Cattle numbers, including cows, kept for milk, declined more than 1,000,000 head up to Jan. 1, 1945, but the rate of decline was checked during the year and the number on Jan. 1, 1946, was not expected to show much decrease from a year earlier. Milk cow numbers increased to a new high record by Jan. 1, 1945, but showed a decline of about 2% by June. Further declines in numbers were indicated for the late months of the year following the end of World War II.

Hog production, which dropped sharply in 1944, was shown by an estimate of only 60,600,000 head on farms on Jan. 1, 1945, compared with 83,852,000 head a year earlier. The pig crop of 1945 was about the same as the 87,000,000 crop of 1944. A gain of about 4,000,000 head in the fall crop offset the decline in the spring crop. The government's goal of 90,000,000 pigs for 1945 was almost attained because of the heavy weights to which hogs were fed because of the large crop of corn. The decline in sheep numbers continued through 1944 and on Jan. 1, 1945, had dropped 7% from a year earlier and down to the level of 1928. The low returns from lambs, the surplus of wool and the labour shortage were the principal factors producing the changes.

Total meat supplies of all sorts in 1945 were only slightly less than the record production of 1944. Consumers' reductions were due to the large proportion that was being used by the military services. The total requirements for the military forces and for export were about 6,000,000,000 lb. The domestic consumption was at the rate of 130 lb. per capita compared with 150 lb. in 1944 and an average of 126 lb. 1935-39. Meat production was high in 1918 following World War I, about 160 lb. per capita, then declined steadily to about 115 lb. in 1935

after which time it increased to the record of 1944, more than 175 lb. per capita. The war demand absorbed the part in excess of the domestic consumption of 130 lb. per capita.

Dairy production reached a new high record in 1945. The number of milk cows and heifers increased slightly during 1944 and continued to increase in 1945. The excellent pastures and large feed supplies helped the yield per cow which made a new record of nearly 4,800 lb. of milk in 1945. The total milk output was estimated at 123,000,000,000 lb., 3% above the previous record of 1942. More milk was allowed to go to civilian use as whole milk and consumption increased to 803 lb. per capita over 788 lb. in 1944 and a prewar average of 801 lb. 1935-39. Restrictions on the use of cream for butter making resulted in creamery butter production declining to the lowest point in two decades or 11 lb. per capita compared with 17 lb. in prewar. Cheese production continued at a record level, most of it being set aside for government purchase until Oct. 1945. The production of dried and canned milk continued high to provide for relief purposes, fully 25% being taken for noncivilian uses.

Poultry production in 1945 recovered most of the previous year's losses although the number of chickens on farms Jan. 1, 1945, was 11% less than a year earlier. A larger crop of chicks was hatched and raised which brought the total production of poultry meat to 3,575,000,000 lb. an amount only exceeded by the record production of 1943 when 3,800,000,000 lb. was produced. The crop of commercial broilers was larger, accounting for 23% of the total. Egg production in 1945 failed to reach the record of 1944 but was 5,050,000,000 doz. compared with a prewar output of 3,335,000,000, 1935-39. Producers' prices for eggs ranged higher through 1945 than in previous years and were above 90% of parity until late in the year. While lower prices were expected with the end of meat rationing the government was committed to support prices during 1946 and 1947. A continued demand for dried eggs for export to Europe was expected. Stocks at the beginning of 1945 were large but were expected to be greatly reduced by the end of the year. Civilian consumption was estimated to be about 390 eggs per capita in 1945 compared with 351 eggs in 1944 and a prewar average of 298 eggs 1935-39. Turkey meat production was favoured by the ample feed supplies in 1945 and good returns to growers. The growing popularity of turkey meat was expected to continue as military requirements were reduced and more of the meat was released for civilian uses. The 1945 crop of 44,200,000 birds compared with 20,800,000 in 1935. Turkeys return about 10% of the total receipts from poultry products. Production of other fowl—ducks, geese, etc.—showed little change during World War II. A generally increased consumption of poultry meat was expected in the post-war period as compared with the prewar period due to the generally higher consumers' incomes. New methods of preparing poultry for market, i.e. cleaned, cut, canned and pre-frozen, were being introduced as rapidly as possible in 1945. Most of the canned and boned chicken meat was set aside for military uses during 1943 and 1944 but was released late in 1945.

The general civilian food supply throughout 1945 was slightly lower than in 1944 as estimated by the U.S. department of agriculture. The meat supplies were short mostly in pork, beef production being 10% above 1944. Until the end of World War II the civilian supply of meats was tight since military purchases took 20% and relief needs another 5% of the total available supply. With the end of the war the government reservations were removed, and ration point values reduced. Government purchases for relief were resumed in October, however, but only on lower grades of beef and veal.

AT HONAD, GERMANY, a farmer and his wife harvest wheat with a pair of oxen in 1945. Lacking adequate machinery and horses, German farmers were obliged to employ backward methods in producing their crops

Poultry and eggs were scarce early in 1945 but became more plentiful after government purchases were reduced. Civilian egg consumption reached a new record of 390 eggs per capita because of the scarcity of meat. About one-tenth of the chicken meat supply was taken for army needs. Turkey production reached a new high record of about 4.5 lb. per capita civilian consumption which is nearly twice that of prewar. The fluid milk and cream supply reached 438 lb. per capita, almost 30% above the prewar average. Butter was scarce because of restricted manufacture. In August government butter purchases ceased and nearly 100,000,000 lb. were turned back for civilian use by the army and other agencies. Cheese was also short until late in the year. Total fruit supplies were about the same in 1945 as a year earlier, canned fruits consumption being only about 40% of prewar since military needs took about three-fourths of the 1944-45 pack; rationing ended on Aug. 15. Vegetable production was at a high level, but the military forces took one-fourth of the canned supply. Potatoes were plentiful and the government had to buy several million bushels to support prices to producers as guaranteed. Rationing of food, except sugar, was discontinued by Nov. 15.

**Stocks and Carry-Over.**—The stored stocks, surpluses and amounts carried over from one season to the next were generally reduced in 1945 by World War II demands notwithstanding the high level of production during 1941-45. The large surpluses of wheat, cotton, corn, etc., of the late '30s were less alarming in size.

The cotton surplus was the largest in relation to the usual market consumption. On Aug. 1, 1945, the total carryover of cotton was 11,040,000 bales which was more than any year after 1941. At the same time there was reported to be 1,364,000 bales of U.S. cotton in foreign countries making a total of 12,404,000 bales world carry-over. Consumption in the U.S. was estimated to be about 9,000,000 bales which was less than the crop of the year 1945. The prospect of reducing the surplus was not bright since only about 3,000,000 bales were exported with a subsidy of 4 cents per pound in effect and stronger competition with export cotton of other countries in prospect.

The carry-over of wheat on July 1, 1945, was 281,000,000 bu. which was the smallest after 1941 and much below the high record of 622,000,000 bu. in 1942. Stocks of wheat were smaller in all surplus wheat producing countries, the total for the U.S., Canada, Argentina and Australia being 826,000,000 bu. compared with 1,168,000,000 bu. in 1944.

Stocks of meat were lower than average in 1945 because of

the active demand, but the end of World War II released some stored goods which were quickly absorbed when rationing was ended. Butter stocks were lower at the end of 1945 due to the continued restriction of creamery butter manufacture and strong consumer demand. Egg supplies in storage were at a high record at the beginning of 1945 but ranged below 1944 and below the average through the years. Poultry meat supplies were also below the level of 1944 throughout the year. The continued high rate of consumption within the U.S. tended to absorb the relatively small excess that was released when the government reduced the volume of buying for military needs. The demands by the relief agencies were a factor until the last two months of the year when the delay in securing funds by United Nations Relief and Rehabilitation administration brought its buying activities almost to a standstill.

Transportation difficulties were slightly reduced by the end of World War II since a smaller tonnage of army supplies was handled. Another relief was the reduced shipment of raw materials for war contracts. The supply of box cars for grain was still short although by July 1, 1945, an increase of 1,500 box cars was reported by class I railroads. This was more than offset by a decline of 11,700 refrigerator and tank cars. These shortages were expected to continue well into 1946 or until new cars could be built. The heavy traffic of the war put a heavy strain on locomotives and on July 1, 1945, there were only 37 more in service than a year earlier. The cancellation of war contracts was expected to enable locomotive builders to fill larger orders for new equipment.

The motor truck situation improved quickly with the end of hostilities. Since truck manufacturers were making trucks for military uses they did not have to reconvert their machines to make trucks for civilian use. Some surplus army trucks became available. The tire shortage shifted from large to medium or small-size such as are used on general purpose trucks. The end of gasoline rationing tended to improve the service of privately owned trucks.

The decision of the Interstate Commerce commission to reduce class freight rates in the south and west and to increase them in the east had little significance to agriculture. Most farm products are shipped on commodity rates rather than class rates and these were not affected by the decision.

Corporations engaged in marketing farm products received net profits in 1945 at about the same rate as in 1944. Operating profits less taxes in 1944 ranged as interest or investment from 6.8% for 12 meat packers to 11.1% for 10 grain mills. Four large tobacco companies made 8.8% in 1944 which was the lowest profit shown after 1935. The number of business failures was less, not counting the number of voluntary terminations. Labour costs averaged about 50% of the total cost for concerns distributing or processing farm products.

The first cost of food products, or what is usually called the farmer's share of the consumer's dollar, was stabilized at a level of about 54% of the retail price through 1945. This was only slightly higher than the average of 1944 and compares with 40% for 1935-39. The range of these percentages with different products was from butter 84%; beef 80%; poultry meat 72%; eggs 71%; milk 62%; fruits and vegetables from 60% to 25%; flour 48% down to bakery products that averaged less than 20% as the cost of the raw material. The higher return to farmers of beef and dairy products was made possible by government payments to processors.

**Lend-Lease Agricultural Products.**—The four years, March 1941 to March 1945, witnessed a constantly increasing flow of agricultural products under the Lend-Lease act. Foodstuffs and other agricultural products accounted for 14% of the total of lend-lease aid and in 1944 represented 6% of the record food

GERMAN PRISONERS of war from Ft. Sheridan, Ill., working on a new cranberry bed at Wisconsin Rapids, Wis. They are arranging the marshy ground into dikes which, when flooded, form a pond that freezes in winter and is covered with sand. In the spring thaw, the sand settles to form a bed for vine planting

supply. U.S. civilians consumed 80%; armed forces 13%; commercial exports 1%; and lend-lease 6%. The total value of agricultural products taken for lend-lease from March 1941 to April 1, 1945, was \$5,426,000,000 out of a total of \$38,971,000,000 or 14%. The proportion of other goods was: munitions 50%; oil 5%; industrial products 20%; shipping and other services 11%. During 1945 the proportion of various foods exported under lend-lease was: meats 7%; eggs 6%; edible fats 17%; dry whole milk 16%; dry skim milk 8%; condensed milk 11%; cheese 8%; butter 2%; canned fish 9%; dried fruits 25%; beans 14%; peas 12%. During 1944 the British received about 3% of the total U.S. food supply which amounted to 10% of their requirements. The U.S.S.R. received 2% of the supply in 1944 and got about 30% of the total shipments. The amounts shipped to Africa, middle east and other Mediterranean areas were relatively small and the shipments to China, India and other countries still less.

Reverse lend-lease supplies received from foreign countries in the form of supplies and services included some considerable amounts of foodstuffs. Up to Jan. 1, 1945, Australia had supplied \$172,375,000 worth of foodstuffs, New Zealand \$80,401,000 and India \$30,986,000, which were used by U.S. military forces in the Pacific and far eastern areas. The total value of lend-lease supplies received up to Jan. 1, 1945, was nearly \$5,000,000,000 compared with a total of about \$30,000,000,000 exports to all countries.

**Prices of Farm Products.**—Prices received by farmers in 1945 were higher than in 1944 and reached a high peak in June and July. While there was some decline in the late months of the year, the average was eight points above 1944. The annual index compared with the base (1910-14=100) was 203. The comparable index for 1944 was 195; 1943, 192; 1942, 159 and 1941, 124. All livestock and dairy products ranged steadily higher than all crops but did not reach such a high point in

Table III.—Farmers' Average Prices, Certain U.S. Crops, on Selected Dates (in cents per unit)

	Wheat per bu.	Corn per bu.	Oats per bu.	Barley per bu.	Rye per bu.	Buck- wheat per bu.	Pota- toes per bu.	Eggs per doz.	Cot- ton per lb.

June, when the livestock index was 202 and crops 210. Ceilings and price supporting measures tended to stabilize prices but even these measures did not prevent some wide variations in the percentages of increase. These are shown by the following comparison of indexes for the first and last war years. Dairy products prices were at 139 in 1941 and 198 in 1944; poultry 121 in 1941 and 200 in 1945; meat animals 146 in 1941 and 210 in 1945. Changes in crops were similar. Food grains stood at 97 in 1941 and 170 in 1945; feeds 89 in 1941 and 163 in 1944; cotton 107 in 1941 and 170 in 1944; fruits 85 in 1941 and 220 in 1944 and truck crops 129 in 1941 and 225 in 1944. These indexes for the whole U.S. do not reflect the local and seasonal changes that occurred in many localities due to transportation and other difficulties. On the whole farm prices reflected the general price rise and were remarkably strong in the face of the large total output of the farms as a whole. The constant demand for increased civilian consumption, military and relief needs provided the market to absorb the increased production.

The price support program of the government was continued through 1945 about as in 1944. This plan was provided in the Agricultural Adjustment act of 1938 amended in 1941 and 1942. This legislation provides that basic crops—corn, cotton, wheat, rice, tobacco and peanuts—be supported in the market to return 90% of parity (except 92½% in the case of cotton). Other crops and livestock also designated to be supported were hogs, eggs, chickens, turkeys, milk and butterfat, peas, beans, soybeans for oil, flaxseed for oil, peanuts for oil, potatoes and sweet potatoes. The strong demand kept prices of many products above support levels.

Prices paid by farmers for commodities were higher in 1945 than a year earlier, the index for 1945 being 180 compared with 176 in 1944. The increase in outlay when interest and taxes were added was from 170 in 1944 to 174 in 1945. Farm wages advanced from 315 in 1944 to 355 in 1945. The ratio of prices received to prices paid by farmers reflected the general farm condition as being somewhat better in 1945 than in 1944, the index for 1945 being 117 compared with 115 in 1944.

INDEX NUMBERS of U.S. production of food grains, all crops, all livestock and fresh vegetables through World Wars I and II. Food grains and vegetables increased slightly during 1945 while livestock made a small decline; all classifications, however, maintained the high production level of the World War II period

Consumer income increased much faster than the cost of food during the World War II period. Food expenditures increased, but at a slower rate than income, although larger quantities of food per capita were purchased. In 1945 with the end of a large volume of war work a decline in food purchases set in. The farmer's share of the consumer's dollar spent for all farm products was 54 cents in Aug. 1945 compared with 55 cents, the high record reached in Jan. 1945. The costs of marketing remained relatively stable after 1943. Government payments to farmers operated both to encourage larger production by farmers and also to provide the consumer with food at a lower price. For instance the farmer's share of the consumer's price for butter was more than 80% until the removal of the subsidy to butter factories when the farm price declined at once. Retail prices of food products advanced slowly from 102 in 1941 to 120 in 1942, 135 in 1943, 132 in 1944 and 134 in 1945 (1935=100). The primary factor in the food supply was the large production in all lines, which resulted chiefly from eight favourable seasons.

Farm Income.—A gross total farm income of \$24,200,000,000 was estimated by the U.S. department of agriculture for 1945 compared with

Table IV.—U.S. Farm Income from Cash Sales, 1945 and 1944

	Jan.-Dec. 1945	Jan.-Dec. 1944
All crops . . . . .	\$9,854,000,000	\$8,801,000,000
Food grains . . . . .	1,493,000,000	1,228,000,000
Feed grains and hay . . . . .	1,520,000,000	1,131,000,000
Cotton and cottonseed . . . . .	1,440,000,000	1,499,000,000
Oil-bearing crops . . . . .	850,000,000	558,000,000
Tobacco . . . . .	955,000,000	755,000,000
Vegetables . . . . .	2,200,000,000	1,564,000,000
Fruits and nuts . . . . .	1,475,000,000	1,444,000,000
All livestock . . . . .	11,520,000,000	11,589,000,000
Meat animals . . . . .	6,320,000,000	6,251,000,000
Dairy products . . . . .	2,940,000,000	2,857,000,000
Poultry and eggs . . . . .	2,510,000,000	2,267,000,000
Government payments . . . . .	850,000,000	817,000,000
Total . . . . .	\$21,374,000,000	\$21,207,000,000

\$23,446,000,000 in 1944, \$22,775,000,000 in 1943 and \$18,399,000,000 in 1942. From 1936 to 1940 this total ranged around \$10,500,000,000 and did not begin to increase rapidly until 1941 when it reached \$13,800,000,000. The expenses of production by farmers—labour, fertilizers, machinery and services increased rapidly and acted as a check on net income. In 1945 the total production expenses were estimated at \$11,200,000,000 leaving a net income of \$13,000,000,000. When this is divided among the persons engaged in agriculture it amounts to \$1,545 per capita in 1945 compared with \$1,465 in 1944, \$1,388 in 1943 and about \$550 in prewar 1936-41. The slower rate of increase in 1945 was due to the fact that production had been pushed to the maximum limit of economy with the labour and facilities available. These national totals and averages do not fairly represent conditions in many parts of the U.S. Cash receipts were about \$3,800 per farm as a whole yet four states averaged more than \$7,500 and nine states under \$2,000, and the inequality among the farmers of many states was very wide.

The income of farmers from nonfarm sources, estimated at about \$3,000,000,000 a year, probably declined during 1945 due to the fact that farm labour was reduced to the minimum. Part-time work in war industries continued during the first half of the year but fell off rapidly after the surrender of Germany since the small industries reduced operations.

Land Values and Debt.—With the increase in farm income and other factors stimulating a demand for land as an investment, values continued to advance rapidly. Surveys for 1944 showed a gain of 15% in the previous year and preliminary figures for 1945 indicated that the rate had increased by at least a fourth. By Nov. 1944 the index of land values was 44% above the prewar base of 100 for 1935-39. The land boom of 1919-20 was being repeated as in one-fourth of the states, values in 1944 were above 1919 levels and for the U.S. as a whole were 20% above the 1912-14 level. While farmers were the buyers in about two-thirds of the sales, nonfarmers bought the other third. About half of the sales were for cash, reflecting the large backlog of purchasing funds. Despite the high proportion of cash sales more people went into debt to buy land in 1943 than in any year after 1920, which offset some of the debt reduction. An increasing demand for farms by returning veterans of World War II led the agricultural leaders and educational agencies to issue warnings cautioning these men against buying at values that might be above earning capacity. All agencies dealing with the returning soldiers were setting up committees to advise with prospective purchasers. The warnings were directed particularly to those without experience or training in farming. A large part of the buying came from those who wished to invest in land as a safeguard against inflation. Some purchases in the vicinity of cities was the result of the desire to avoid congested city life with a belief that modern transportation would make more distant areas easily accessible for those employed in industrial centres.

The total of farm mortgage debt of the U.S. was reduced steadily after 1916 and was only a little more than half the high total of 1923. From a record total of \$10,780,000,000 in 1923 the total of mortgages declined to \$5,634,000,000 in 1944 the last year of estimates. While a rapid increase was recorded after the current boom started, the use of the increased income to reduce indebtedness more than offset the recent increase. In 1944 the ratio of farm mortgages to values was one to

eight as the total value of farm real estate in 1944 was estimated at \$45,592,000,000. Educational agencies were advising farmers with high debt ratios to reduce their indebtedness while farm income was high to avoid a slump such as occurred after World War I when prices of farm products declined.

The national balance sheet of agriculture was estimated in 1945 to be as follows: assets: real estate \$50,225,000,000; other assets—live-stock, machinery, money, etc. \$40,477,000,000. Liabilities: mortgages \$5,271,000,000, other obligations \$8,952,000,000; proprietors' equities \$81,820,000,000. In a five year period the latter increased from about \$44,000,000,000 to nearly \$82,000,000,000.

**Farm Population and Labour.**—The farm population of the U.S. declined further in 1944 and on Jan. 1, 1945, reached the lowest number in the 35 years of record, a total of 25,190,000 persons. This was a net loss of 331,000 or 1.3% from the total of 25,521,000 on Jan. 1, 1944. The larger decreases during 1941-42 and 1943 had brought the total down from 30,269,000 in 1940, a loss of 16.8%. The downward change in numbers was not universal over the country, however, since in four of the nine divisions of the U.S. there was a slight gain in 1944. This was in the New England and Atlantic states in the east and on the Pacific coast. While estimates for 1945 were not available at the close of the year the trend appeared to be a return to farms. The heavy losses in the early war years were due to high wages in war industries, the draft and the employment of farm women in war industries. The return to the farms was stimulated by the reverse action of these same factors. Of the total of 5,079,000 persons making up the net loss of farm population 1940-45, 1,850,000 were taken by the military forces, but were more than offset by 1,907,000 excess of births over deaths in the U.S.

The heaviest loss of population during World War II was in the west south central states where the loss was 25% in the five years 1940-45. The east south central loss was 20% in the same period. These losses were attributed to the building of large war industries in these areas, although the farm increases in the eastern areas was thought to be due to the use of farm dwellings by war workers because of the shortage of housing near new war industries.

The changes in 1944 were estimated to be as follows: births 591,000, deaths 246,000, movement to farms 817,000, movement away from farms 1,293,000, to armed forces 300,000. These estimates were made by the U.S. department of agriculture and the census bureau from the results of the ten-year census and annual reports from about 12,000 farmer reporters.

Table V.—U.S. Production and Yield per Acre for 1945 and 1944 Crops

Crop	1945 yield* per acre	1945 pro- duction	1944 yield* per acre	1944 pro- duction
<b>Field crops</b>				
Corn, bu. . . . .	33.1	3,018,410,000	33.2	3,228,361,000
Wheat, bu. . . . .	17.3	1,123,143,000	18.2	1,078,647,000
Oats, bu. . . . .	37.3	1,547,663,000	29.9	1,166,392,000
Barley, bu. . . . .	25.9	263,961,000	23.	284,426,000
Rye, bu. . . . .	13.3	26,354,000	11.5	25,872,000
Flaxseed, bu. . . . .	9.9	36,688,000	8.4	23,527,000
Rice, bu. . . . .	46.6	70,160,000	46.3	68,161,000
Hay, all tame, short tons . . . . .	1.41	104,951,000	1.41	97,980,000
Beans, dry edible, bags . . . . .	8.64	13,573,000	7.84	16,128,000
Soybeans, bu. . . . .	17.6	191,722,000	18.4	192,863,000
Peanuts, lb. . . . .	658.0	2,079,600,000	678	2,177,670,000
Potatoes, bu. . . . .	150.6	425,131,000	130.4	379,436,000
Sweet potatoes, bu. . . . .	94.3	66,836,000	92.9	71,651,000
Tobacco, lb. . . . .	1106.	2,041,811,000	1072.	1,835,371,000
Sugar beets, short tons . . . . .	12.	8,638,000	12.2	6,821,000
Cotton, bales . . . . .	249.6†	9,195,000	295.3	12,359,000

Apples, bu. . . . .	...	64,400,000	...	124,212,000
Peaches, bu. . . . .	...	81,578,000	...	75,008,000
Pears, bu. . . . .	...	33,574,000	...	30,821,000
Grapes, tons . . . . .	...	2,804,000	...	2,580,000

\*Estimated by the United States dept. of agriculture. †Pounds.

The farm labour force in 1945 was shrinking steadily until the end of the year notwithstanding the end of hostilities. On Dec. 1, 1945, the total number of family and hired workers was estimated by the U.S. department of agriculture to be 9,245,000 compared with 9,337,000 a year earlier. The average for the year 1945 was 9,843,000 compared with 10,037,000 a year earlier. During the year the number rose from 8,005,000 on Jan. 1 to a peak of 11,100,000 in July and then declined. Of the total labour force 7,726,000 were family workers and 2,118,000 hired men and women. Emergency workers were employed in 1945, as in earlier war years, but these were generally unskilled and had no great effect on production except in some fruit and truck areas. The use of machines increased as rapidly as they could be obtained. Corn pickers were used on 50% of the acreage in the corn belt of Indiana, Illinois, Iowa and Minnesota. The average hours worked per day were about 11 hours for farm operators and 9 hours for hired help. This varied from nearly 12 hours in the New England and Atlantic states for operators to 10 hours in the west. Farm wage rates continued to advance and in Oct. 1945 were \$88 per month compared with \$80 a year earlier. The range was from a low of \$41.30 per month in South Carolina to \$165 in Washington. The higher wages paid expert fruit pickers in the north-west and California accounted for the high averages in those regions. The index of farm wages for the U.S. as a whole in Oct. 1945 was 355 (1910-14=100) compared with 325 in 1944 and 154 in 1941. The returning soldiers came too late in the season to give any material relief.

**Crop Insurance.**—Congress voted to liquidate crop insurance in 1943 and 1944 but reversed this action in Dec. 1944 to provide for the insurance of wheat, cotton and flax crops planted in 1945. In addition it provided for trial insurance on other crops to determine the most practical terms for each. Insurance policies were written to cover 199,300 farms in 1944 including 113,183 cotton, 23,394 spring wheat, 38,072 flax, 12,363 corn and 12,288 tobacco. It was estimated that in 1946 at least 500,000 farms would be covered as in 1943. From 1939 through 1943 the Federal Crop Insurance corporation insured about 1,200,000 ac. of wheat in Oregon for a production of nearly 15,000,000 bu. Premiums amounted to 850,000

bu. and 2,761 losses were paid with 513,000 bu. leaving a reserve of 337,000 bu. The insurance on crops is against unavoidable losses of yield. The coverage may be either for 75% or 50% of the long time average of the farm. If the yield is less than the coverage the loss is computed in bushels and paid in cash. Another plan covering 75% of the total is to protect the farmer from loss of investment. The Federal Crop Insurance corporation has three sources of funds: (1) premiums to cover average losses; (2) capital provided by the government; and (3) an annual appropriation to cover the costs of administration. Participation by farmers is voluntary but insurance cannot be provided in a county unless at least 50 farms or one-third of the farms growing the crop to be insured agree to participate. The corporation may also refuse or limit insurance on those farms or areas where the risk is extremely large. The Agricultural Adjustment administration performs the services of determining yield rates and premiums but in 1945 the commission employed agents to sell the insurance on a commission basis of payment. Adjustments were made by special employees of the corporation.

**Fertilizers.**—The use of commercial fertilizers continued to increase in 1945 and exceeded the output of 12,000,000 short tons used in 1944. The increase was at the rate of about 10% in each of the war years. With the end of World War II the supply of nitrates was expected to increase rapidly. There were in 1945 ample supplies of potash under way of development and the U.S. can produce all the phosphates it needs. Prices of fertilizers continued stable under the ceilings and made the smallest advance of anything that farmers buy in quantity. More and more commercial fertilizer was used at the recommendation of the educational agencies to aid in soil rebuilding after the heavy cropping of the war period. (J. C. Ms.)

**Great Britain.**—While 1944 witnessed the peak of the wartime drive for increased production of priority foods from British farms, 1945 heralded a tentative return toward peacetime levels. Thus the 1945 total grain acreage was less than in 1944 or 1943, although it was still 3,000,000 ac. above the 1939 total. The official June returns for England and Wales showed a drop of more than 1,000,000 ac. in the acreage of wheat from the highest wartime figure of 3,280,000 ac. in 1943. But the acreages of barley and oats showed slight increases over those of 1944. Crops other than grain remained almost constant. Potatoes, roots and sugar beets all showed small declines, but beans dropped substantially. On the other hand there was a big increase in vegetables for human consumption. During the year a total of 177,000 ac. was returned to permanent grass.

The statistics of the livestock population showed that the dairy herd was still expanding and the cattle population increased by 130,000. A start was also made to make good the loss of nearly 6,500,000 sheep during World War II, and the total number was increased by 265,000. Pigs increased by 224,000, but there were still fewer than half the pigs recorded in 1939. Similarly the increase of 6,484,000 head of poultry brought the total up to only two-thirds of the prewar level. Horses continued to decrease and there was a drop of 26,000 between 1914 and 1945.

Farm prices in 1945 also reflected the beginning of a shift of emphasis from arable production toward livestock. For the first time prices of major products were fixed under the new arrangement whereby the government reviewed, in consultation with the National Farmers' union, essential products and the prices necessary to encourage their production. A first announcement was made in March 1945 when relatively better prices for livestock were allowed, while compulsory cropping directions for wheat were discontinued. The hope was also expressed that it might be possible to allow an appreciable relaxation in compulsory directions to grow potatoes and sugar beets. But the deterioration in the world food situation which subsequently set in made it necessary to issue a second announcement in July. This instructed agricultural executive committees that it would be necessary to obtain in 1946 approximately the 1945 acreages of potatoes and sugar beets, and, if necessary, this should be done by the service and enforcement of directions. The increases in price of 10s. per ton for potatoes and 5s. per ton for sugar beets were to be maintained. A target of 2,500,000 ac. for wheat in 1946 was also set, but since cropping directions were not to be issued for wheat the reduction in the acreage payment from £4 to £2 per acre was to continue. It remained to be seen how far this announcement would retard the shift back to normal production. The termination of lend-lease in August did not help the general situation. The county war agricultural executive committees continued to function as hitherto and up to Sept. 1945 there was no announcement about their future position. Preliminary steps were taken to set up the new national advisory service, but the full launching of the service was still to come.

The official June 1945 returns showed the labour force available to farmers as the largest for many years. Total male workers, including casual workers, increased the number in 1944 by 19,400. There was a slight decrease in the number of women employed. Prisoners of war numbered 54,500, but after June many thousands more German prisoners of war were made available for work on the land. These were of valuable assistance in coping with the lifting of the potatoes and sugar beets in the autumn, crops which in 1944, were too big for the labour force then available in many districts. In April the Agricultural Wages board issued an order increasing the minimum wage for all adult male workers in England and Wales by 5s. per week and the overtime rates by 1d. per hour. The national minimum wage was thus increased to 70s. a week as compared with an average wage of 33s. in 1939.

On the whole the climate in 1945 was favourable for planting and growth. Harvest weather, on the other hand, varied considerably in different parts of Great Britain. In western England and Wales weather conditions protracted hay making, but in the north and northwest conditions were more favourable and the bulk of the hay crop was secured in a satisfactory condition. The yield of both seeds hay and meadow hay was well above the ten-year average. The cereal harvest in early September was not yet finished. In 1945 it was the south and midlands of England which had bad weather, while in the north and northwest there was an unusually favourable harvesting season. The yield of wheat was forecast to be about the ten-year average, and the grain was of good quality generally. Heavy yields of barley were obtained in many areas and the county average was above the ten-year level. The yield of oats was also

somewhat higher. The prospects for main crop potatoes were promising. This was also the case for sugar beets, the yield of which was expected to be above average, although sunshine was needed to improve the sugar content. It was a good year for pastures, and the prospects for the autumn were favourable. (E. Ts.)

**North, Central and South America.**—The total output of food products in North America was about 5% less in 1945 than the record production of 1944 but about one-third larger than the prewar average. The decline in production this year was due chiefly to less wheat and pork in Canada, less sugar in Cuba and smaller crops in Mexico.

Canadian wheat production was about 335,000,000 bu. in 1945 compared with 436,000,000 bu. in 1944 and the ten-year average of 363,000,000 bu. 1934-43. The acreage was about the same as a year earlier but below the average, with yields lower. About 350,000,000 bu. of wheat were exported in the year ending July 1, 1945, but a smaller amount was available for export in 1945-46. Feed grains, oats, rye and barley were all less productive which reduced the output of meat. Hog slaughter declined from the high total of 8,750,000 head in 1944 to about 6,000,000 head in 1945. The pig crop was smaller. In order to ship as much meat as possible to England, two meatless days were ordered and meat rationing was resumed in Sept. 1945, after the end of hostilities, to meet the requirements for export. Dairy production was higher, cheese production 10% larger, dried milk 14% and canned milk 10% more. Egg production was larger and about 90,000,000 doz. were shipped to the United Kingdom.

Mexico suffered from drought in 1945 and crop production was 10% less than in 1944. The corn crop amounted to only 80,000,000 bu., compared with 96,000,000 bu. harvested in 1944, which was insufficient for domestic needs and several million bushels were imported. The wheat crop of 14,000,000 bu. was only half of domestic requirements. Bean production was low but the stocks carried over were large and the supply was about equal to requirements. Vegetable production, particularly tomatoes, was about equal to 1944 when more than 9,000 cars were exported, of which 7,800 were tomatoes. All of Central America suffered from drought in 1944 and surpluses for export were reduced. This area had increased crop production during World War II, but two dry years reduced stocks and shortages were acute in many regions. As a whole the area was barely self-sufficient since banana exports were restricted by reduced shipping facilities.

Cuba had the worst drought in 86 years with rainfall only 40% of normal in 1945. Foodstuff production was reduced severely and livestock suffered. The sugar crop was reduced to 3,925,000 short tons which was 1,700,000 short tons below the production of 1944. All of this crop except 284,000 tons for domestic consumption was for export to the United Nations under contract. Rice production was low and imports amounted to nearly 400,000,000 lb., mostly from the U.S.

South America as a whole suffered from drought in 1945 and both cereals and livestock were injured. Exports of Argentina beef were only 55% as large as in 1944 and Brazil and other countries had about 10% less rice for export. Argentina expected only 96% of the prewar average output of food products. The 1944-45 corn crop of 117,000,000 bu. was only one-third as large as that of 1944 and 60% smaller than the prewar average. Wheat production was also off 40% from 1944 amounting to only 150,000,000 bu. Both beef and pork production declined with the reduction of feed crops and poor pastures. Brazil's food production was reduced to about 12% below 1944 and only 16% above prewar although food production had been greatly expanded during World War II. The surplus of coffee was as large as usual and continued to be the main item for export. An effort by the government to get farmers to plant less cotton and more rice, beans, corn and peanuts was reported to have been fairly successful. In Bolivia the increase in mining drew labour from the farms and made that country more dependent on imported foodstuffs. Chile, on the other hand, was about self-sufficient, lacking only sugar which came from Peru. A surplus of 300,000 short tons of sugar was produced in Peru which is less than the 1944 crop of 397,000 tons. Paraguay and Uruguay both suffered from the general drought and produced smaller crops in 1945. Venezuela increased food production but was still upon an import basis. Colombia had nearly its domestic requirements of grains and was expecting to rapidly increase banana exports as shipping became available.

Australia's severe drought experience in 1944, the worst in its history, was partly recovered in 1945 but not sufficiently to bring total production back to prewar average. A wheat crop of 135,000,000 bu. was estimated compared with an average of 170,000,000 bu. 1935-39. Rice was less than a half crop. Butter production was 10% below the previous year, apples and other fruits were about 40% off from 1944. Meat production was estimated at 1,000,000 short tons compared with 1,160,000 short tons in 1944. Lamb and mutton showed the greatest decline with 19%. The sugar producing areas were outside the drought belt and a larger crop of about 720,000 short tons was expected for 1945-46. The full recovery of agriculture was expected to require two full years, or until 1947.

New Zealand's agricultural production showed further gains in 1945 over the low period of 1942-44. Butter production increased 12%, cheese 9% and meat production 4% over 1943. Wheat production was down to prewar levels and below requirements. Because of the drought in Australia, wheat was imported from Canada. Onions produced a high record harvest, and potatoes were about at prewar levels. Meats and dairy products continued to be rationed in order to provide supplies for the armies in the Pacific and exports to England. Labour and fertilizer shortages were the limiting factors in New Zealand food production. The Union of South Africa also felt the drought that spread over the southern hemisphere in 1944. Wheat returned 7% less than the prewar average, corn 18% less and other crops and fruits about the same. Potatoes and sugar cane yielded above prewar levels and livestock products were 29% above the prewar average.

**Continental Europe.**—The closing campaigns of World War II and unfavourable weather combined to reduce the agriculture of Europe in 1945 to the lowest output of the six years of hostilities. This area as a whole had a prewar deficit of 10% and regions that then produced surpluses were unable to support themselves with a minimum of requirements in 1945. A severe winter was followed by an extreme drought, particularly in southern Europe, with the result that yields were low,

harvest incomplete and the quality of produce very poor. Scarcity of seeds, fertilizers, farm animal and motor power and skilled labour also were extreme handicaps. The breakdown of governmental statistical services and dislocated trade and transportation made it extremely difficult to accurately estimate the situation. Experienced observers estimated that the total farm output was about 25% below the prewar level. The very critical shortages in cities and devastated areas and the destruction of market and storage facilities tended to emphasize needs in these areas and to encourage underestimates of the quantities produced on the farms. The most accurate appraisals were made by the authorities of each country as civilian governments were restored after hostilities ended. As each of the countries occupied by the enemy was liberated the true situation was more accurately measured.

French agriculture failed to make any substantial recovery in 1945. Total production was probably the lowest in five years. Cold, wet weather in the fall of 1944 delayed wheat seeding and in the spring a drought spread over southern France. The wheat crop of 1945 was the smallest after 1940. Potatoes and sugar beets declined from 1944 but feeds and pastures were about the same. The supplies on farms were fairly adequate for the rural population but the cities suffered severe shortages. A freeze in May damaged fruit trees and vines but stocks of wine were found to be considerable when the country was liberated.

Belgian crop conditions were less favourable in 1945 than for several years. Total crop production was 15% to 20% below prewar levels while livestock production was only 50% of prewar. Potatoes and sugar beets were poorer than average due to lack of sufficient fertilizers as well as the bad weather. Livestock made small gains in numbers due to the shortage of feed since all possible use as human food was made of crop production.

The Netherlands harvested food crops in 1945 about 20% below the average prewar levels although production had been expanded to much higher levels during World War II. Livestock production declined to less than 50% of prewar levels. The reduction of acreage due to flooding was estimated to be 9% for crops and 7% for grasslands. Yields in 1945 were very low due to lack of fertilizers and insecticides and to bad weather. Feedstuffs were so scarce that milk production was only 60% of prewar levels and was being used as fluid milk instead of for cheese and butter. Imports of grain, sugar and fats were increased to maintain minimum diets of the urban population.

Denmark presented a surprising contrast to the other Low Countries by the fact that during World War II it maintained an adequate diet for its people and also provided some food products for export. The crop year 1945 was good and bread grain production was equal to domestic needs. The war changed Danish agriculture relatively little and the number of livestock on July 1, 1945, 3,200,000 head, was larger than the 1933-37 average and almost up to the 1939 figure. Milk yields per cow were maintained, largely upon domestic feeds and a surplus of about 65,000 short tons of butter was produced. The livestock surplus was exported to Germany up to 1944 in which year 40,000 short tons of beef were shipped. The Danes consumed more food per capita than any other Europeans during the late years of the war period. Norway started to recover its prewar crop production which was only 50% of domestic needs. Fairly good crops were harvested in 1945 in spite of fertilizer shortage. Livestock numbers were greatly below prewar levels except for horses and sheep. Dairy cows numbered 14% less than in 1939; hogs 50% less and poultry two-thirds smaller. Sweden continued to be self-sufficient in foodstuffs. Small exports were made to Finland and Norway during 1944-45 by reducing stocks and rationing. Crops in 1945 were generally above prewar totals and potatoes returned 40% more than the short crop of 1944. Cattle and hog numbers were maintained. Finland had a difficult year due to the loss to the U.S.S.R. of 10% of her small crop area without a corresponding loss of population. Total domestic agricultural production was estimated at more than a fifth below prewar. To meet this change a larger proportion of crop production was devoted to human needs and livestock products reduced in proportion. Meat supplies were estimated at less than two-thirds the 1933-37 average.

Spain and Portugal, which are similar agricultural regions, suffered from a very severe drought in 1945. The Spanish wheat crop was estimated to be smaller than in 1940 when it was estimated at half the 1931-35 average. Rice was short due to the lack of water for irrigation. Olive oil output was low and there was expected to be little or none for export. Livestock numbers were much below average after the Spanish Civil War and feed shortage in 1945 led to excess slaughter and heavy losses from disease. Portugal reported food production at the lowest level after 1929 and only about 70% of the prewar consumption. The drought was the principal cause of this decline since fertilizers and labour were not scarce. Switzerland had an unfavourable crop year and grains and pastures were inadequate. Production of bread grains was increased more than 50% during World War II while the output of livestock products declined. Total requirements were about double domestic production and urban communities were depending on imports.

Italy suffered from the drought of 1945 as well as from the disorders following the end of World War II. The 1945 wheat crop was the smallest after 1920; rice the smallest from 1899 and sugar one-tenth of normal. Olives harvested were the smallest crop in 20 years. Livestock and animal products were estimated at only 60% of prewar totals. The situation improved little after early 1944 and the distribution agencies were particularly deficient. While more than 5,000,000 short tons of grain were available, less than a third of it was expected to reach the urban consumers, outside of the black market. A large part of the population was almost wholly dependent upon imported relief supplies at the beginning of winter of 1945. The lack of government organization was the cause of the disorder in the opinion of competent observers.

Southeastern Europe, comprising the Danube basin, formerly known as the "breadbasket of Europe," suffered greatly in the final days of World War II. Changes in governments, land reforms and the loss of livestock, particularly work animals, all operated to reduce agricultural production. In 1945 the severe drought swept this region and reduced the output of the reduced acreage of crops. Breaking up estates did not improve production. In the four nations—Hungary, Rumania, Yugoslavia and Bulgaria—the grain acreage was estimated to be only 75% of prewar, which with small yields in 1945, produced only 60% of the prewar output. Of

this reduced supply a part was to be supplied to the Russian forces which would leave none for export, and might result in a deficit of large proportions. The disturbed peasants were hoarding and the urban centres were suffering from the lack of supplies. Greek grain production was down to about 50% of prewar levels due to the drought and reduced acreage. Potatoes were the one crop that showed an increase over recent years. The total of 1945 crops was, however, larger than under German occupation. Livestock was reduced to about 50% of the prewar numbers, while sheep, goats and donkeys declined only 25%. Without continued large relief imports the suffering of the Greek people was expected to be extreme during the winter of 1945-46. Albania also had a poor year and faced extreme sacrifices.

East central Europe, comprising Poland, Austria and Czechoslovakia, had generally reduced food production in 1945. While the season was not unfavourable in Poland, the disturbed conditions—lack of work animals, seeds, fertilizers and machinery—so reduced plantings that no adequate food supply could be expected. The peasants were living on a subsistence basis and the greatly reduced city populations were near the lower margin of existence. Adequate or reliable statistics were not available in 1945 due to the unorganized local governments and the continued restrictions upon travel by foreigners. Czechoslovakia was reported to be much better supplied than Poland. Grain production was reported to be only 8% below prewar when the country was almost self-supporting in foodstuffs. The potato crop was reported only 15% below prewar and the beet sugar crop was near to domestic needs. Livestock numbers were still reduced from the losses to the invading armies. In general, Czechoslovakia maintained her agriculture through World War II better than other invaded countries. Austria, always with a food deficit of about 25%, was hard hit by the invasion and also during the last months of the war. Crop production was reported to have declined about one-third compared with prewar which made the deficit almost 50% of prewar.

German agriculture reached the low point in the century in 1945. The final days of World War II created such disorder that reports were conflicting and unreliable; to distinguish between fact and propaganda was difficult. Even the staffs of the occupation armies and U.N.R.R.A. were unable to agree. Agricultural observers generally agreed that the German people who were not in the battle areas managed to harvest their grain and to plant and harvest a considerable crop of potatoes. The total acreage was estimated at 10% to 15% below prewar. Yields were believed to be 15% to 20% below prewar. The great loss and deficiency was in the use and in the destruction of stocks and reserves by bombing which left the demolished cities of large population almost entirely without supplies. The loss of transportation facilities and food collection agencies made the outlook for the winter 1945-46 particularly dark. The situation in the zone of Russian occupation was not revealed up to the end of 1945. Such reports as were available indicated that production during the summer of 1945 was much below the prewar level due to the movements of population, loss of seeds, stocks, animals, etc. The breaking up of landed estates in East Prussia had not proceeded to an extent that would do otherwise than reduce the total production. The generally high state to which German agriculture was raised in 1939 appeared to have been largely lost.

The Soviet Union as a whole had a 1945 plan in the spring for an expansion of all crops by 20,000,000 ac. compared with an increase of 30,000,000 ac. in 1944. Reports on the harvest were limited but indicated that total production probably increased since allotment of rationed foods was improved. In June 1945 it was reported that 26,200,000 ac. more of spring crops had been planted than in the preceding year. Acreage was believed to be below prewar in areas that were devastated by war. In the Ukraine the 1945 acreage on collective farms was reported to be 18% above 1944 yet 22% below 1940. Sugar beets acreage was reported about four-fifths of prewar. The weather was reported to be generally favourable in both European and eastern Russia. Larger numbers of livestock were available for slaughter and the production of dairy products was improved by better feed supplies.

**Africa and Asia.**—North African production was severely reduced by the drought of 1945. The loss changed the region from an export to an import area. The combined production of wheat and barley in French North Africa was officially estimated to be only one-fourth of the prewar average. The output of olive oil was also below average. The drought forced the slaughter of livestock which increased the supply of meat and reduced livestock numbers from the high levels of the war years. Turkey was also adversely affected by the drought and output was less than the two previous years but equal to that of prewar. Large stocks of grains were reported on hand. Egypt produced food crops about equal to 1944. Cotton was restricted in acreage to allow for more food crops. Corn production was good in 1945 and assured an ample supply of the principal food of the natives.

In the middle east the 1945 food production appeared to be sufficient to meet domestic needs until the next harvest. Iran had a good grain crop. While some areas suffered from the drought, there were other areas in which production was sufficient to take care of the deficits.

India's total food production in 1945 was up to the average, rice and wheat somewhat higher. The output of rice and wheat was not sufficient to meet average requirements and about 1,000,000 short tons each of rice and wheat imports would be needed before the next harvest. While local shortages were reported from some areas there was no general alarm over famine such as occurred in 1942 and 1943.

In China the year 1945 was one of great improvement in the food situation. Rice production was about 10% below the prewar average and wheat nearly a third larger than prewar. Some areas in occupied China were very short of stocks due to enemy action. In a few areas droughts reduced yields and imports would be needed. The departure of the Japanese who had lived off the land for many years was expected to release considerable food for the Chinese. Shipments to Japan would also come to an end unless there were surpluses to be sold.

Japan faced a reorganization of her agriculture with the surrender. The loss of colonies and occupied territories cut off import sources. Japan was importing about 15% of its total needs before World War II. Rice imports amounted to 20% of the total consumption. Only 30% of the soybean requirements were grown and three-fourths of the sugar used came from Formosa. Fish took the place of meats at the rate of 95 lb. per capita before the war. During the period 1937-41 Japan had access to abundant

food supplies but in 1942 the war imposed new burdens on her food resources. Efforts were made to increase domestic food production but with little success. After the surrender Japan began to reorganize and intensify agriculture. Some land reforms were proposed by the Allies but such changes did not give immediate benefits. The restoration of the fishing industry was to be the main relief and imports of rice, soybeans and sugar were being arranged by the Allied control agencies before the end of 1945.

Throughout the rice area of southeastern Asia the food supply situation was confused and unsettled through 1945. In most areas the native production was adequate to support the scattered population living in villages and on the land. The larger cities were without large reserves due to the disrupted transportation and trade facilities. The rice crop of world area was estimated to be about the same in 1945 as in 1944 or about 90% of the prewar production. Burma, the Philippines, Siam and Indo-China all had less than average crops and normal production was not expected to be restored until 1946 or 1947.

**Role of Food and Agriculture in World War II.**—The slogan "Food will win the war, and write the peace," directed attention to the importance of U.S. agriculture in World War II. While the second part of this dual objective was only partly accomplished at the end of 1945, the record on farm production as a whole was sufficiently advanced to be subject to analysis.

The stupendous accomplishment of U.S. farms during World War II is more evident when the record of the prewar period 1930-40 is reviewed. In 1935 production was only 11% above that of pre-World War I, 1910-14. Farm output increased to 33% above the base in 1939 but prices paid to farmers were only 95% of the pre-World War I level. Farm income was low and there was widespread complaint among producers. Large stocks were on hand and the outlook for agriculture was generally gloomy. With the outbreak of World War II the situation changed rapidly. Lend-lease began early in 1941 and it soon became evident that the U.S. would be called upon for a much larger supply than normal production would provide. A "Food for Defense" project was started in 1940 but did not get into action until 1941. The total volume of agricultural output in 1940 was only 4% larger than in 1939. It was not until farm prices began to rise rapidly in 1941 that the big advance started. Prices went up to 24% above the base in 1940, then to 59% and on to the top of 200% in 1945. At the same time the volume of production increased from 36% above the base in 1941 to 58% in 1945.

Pearl Harbor marked the beginning of the rapidly increasing need for more farm products. Full employment increased consumers' requirements; the military agencies began to buy heavily for immediate use and to build up reserves, and lend-lease requirements expanded. U.S. and Canadian agricultural production became vitally essential to the Allies since normal prewar trade was seriously disturbed by the conflict. Great Britain, usually dependent on imports for 60% of her food and raw materials, was cut off from her normal sources of supply. The German invasion of Russia suddenly destroyed the self-sufficiency of that nation. At the same time the Japanese movement to the South Pacific blocked off the usual sources of many essential foods like rice and vegetable oils. This combination of circumstances was quite different from that of World War I when the submarine blockade was the principal problem before the Allies.

**Food for the Allies.**—The changes in exports of food products during World War II showed how the U.S. and Canada became the great reservoir of food supply for the Allies. Before the war, in 1935-39, the exporting countries stood in the following order in value of food exports: Argentina \$548,000,000; Australia \$272,000,000; New Zealand \$242,000,000; Brazil \$230,000,000; Canada \$217,000,000; and the United States \$212,000,000. Compared with the foregoing the situation in 1944 was as follows: United States \$931,000,000 in exports; Canada \$529,000,000; and Argentina \$490,000,000. Argentina dropped from first to third place as a food exporter. The change was even more startling in the percentages of the total amount of food exported by all the countries accessible to the Allies. The U.S. provided 33% of total food exports; Canada 16.2%; and Argentina 17.4%. Australia and New Zealand dropped to about 9% each. The U.S. with its large total production, nearly all of which is usually consumed domestically, was able to produce a much larger volume for export than Australia or New Zealand which usually export all the surplus they are able to produce and have a population of only a few million people compared with the 135,000,000 in the U.S. The U.S. and Canadian supplies were also so much nearer Great Britain that shipping time and space were conserved by using their supplies rather than those of far-away Australia, New Zealand or Argentina.

The U.S. contribution to the food supplies of the Allies is also shown by the percentage of U.S. production that was exported. The shipments for the three years 1942, 1943 and 1944 were similar. The following percentages of each food group were exported in 1943: meats 8.9%; eggs 15.4%; cheese 15.8%; condensed milk 18.1%; dried milk 42.1%; fats and oils 13.5%; wheat and flour 5.2%; and butter 5%.

Lend-lease shipments made up about 90% of total food exports during 1942-44. More than 61% of these food products were sent to Great Britain; 29% to U.S.S.R.; 6% to the African-Mediterranean area; and 3.2% to China and the far east. Shipments to Great Britain represented about 3% of U.S. total supply but 10% of the British requirements. These supplies were required to bring up the daily consumption of civilian war workers. Even with these supplies the civilian of Great Britain received on the average 2,900 calories per day compared with 3,400 calories for a U.S. civilian. U.S. military services were also much better fed than any other armies in the world. The U.S.S.R. in 1944 received 2% of the total U.S. food supply, which permitted the nation to improve the very limited rations of war workers and armies. Food was a vital need to the U.S.S.R. after Germany invaded the fertile Ukraine.

In values, total lend-lease agricultural products for the period March 1941, to April 1945, amounted to \$5,425,819,000 or 13.9% of the total value of lend-lease aid. The total to the termination of lend-lease activities late in 1945 probably amounted to about \$500,000,000 more. At the same time there were considerable commercial exports to many countries, not including U.N.R.R.A. shipments. The food received by reverse lend-lease from other countries was not imported into the U.S. but used by U.S. military forces. This supply relieved the national stocks of considerable drain, however, amounting Jan. 1, 1945, to a considerable total not reported in detail at the close of the year.

**World Wars I and II.**—A comparison of agricultural production in

World Wars I and II shows that while production increased much more in World War II the volume of exports was about the same, although civilians consumed more in World War II. Total food production was 15% higher at the end of World War I than at the beginning, while in 1944 it was about 35% higher. In World War I food grains and sugar were emphasized whereas in World War II the emphasis was upon oil crops and livestock. The result was that the output of meats and poultry products in World War II was almost four times as great as it was in World War I, reaching 40% above prewar. Oil crops increased most of any group of crops.

If allowance is made for increase in population, domestic food supplies increased about 20% during World War II. The shortages that were the cause of complaints over rationing were the result of reduction of imports of some products which shifted consumption to other foods. Sugar was diverted to the manufacture of alcohol and in some cases food grains were used for feed for animals. The principal reason for some shortages was the greatly increased consumption by civilians due to the higher purchasing power from high war industry wages. Another difference between World Wars I and II was the fact that in World War I most of the products exported were in the raw, unprocessed form while in World War II dried egg and milk, dehydrated vegetables, etc., were shipped in large volume. Cereals such as wheat were the principal items exported in 1918 while in World War II wheat shipments were smaller than in prewar.

Production of food increased in most of the Allied countries during the four years 1942 to 1945 inclusive. Final statistics on 1945 were not available by the end of the year but in most countries it was a year of high production. The greatest percentage increase was made by Great Britain whose index, compared with the prewar base 1935-39, was 158 in 1942, 172 in 1943 and 168 in 1944. The U.S. made the greatest volume gain and the index was 133 for 1942, 132 for 1943 and 142 for 1944. This index includes only food products and does not cover such crops as tobacco and cotton. Great Britain increased the acreage of crops by about 50% and converted a large part of the acreage into food crops, restricting the output of meat and eggs.

**How U.S. Agriculture Expanded.**—The gain in agricultural production during World War II came from four sources: (1) expansion of acreage; (2) high record yields; (3) the use of more machinery; and (4) over-all favourable weather in that there were no major crop disasters such as the long drought in the early '30s.

The cultivated acreage reached the high point of 351,000,000 ac. in 1944 and declined about 4,000,000 ac. in 1945. This was 30,000,000 ac. more than was cultivated in 1939, but not up to the level of 1932 when 361,000,000 ac. were farmed. The area cultivated in the Atlantic and south central states was the lowest in 17 years, reflecting the decline in cotton growing. Another favourable factor was the small acreage losses of crops planted and not harvested. An average of only 11,500,000 ac. was abandoned during the period 1942-45 compared with 39,000,000 ac. lost in the four years 1933-36, and 46,000,000 ac. lost in the single year 1936. Had the period of World War II not been favourable for crops the final results would have been much smaller.

Record yields of nearly all crops and increased output from dairy cows, meat animals and poultry, were the next important contributing factors in providing the abundant food production. Crop yields per acre averaged about 30% above the predrought period 1923-32 and 16% above 1939. The entire war period was one of steadily increasing yields and the 10% increase in acreage could not have brought the great total increase of output without the accompanying increase in yields.

The number of all-time production records made during 1942-45 exceeded that of any previous similar period in the history of the country. Outstanding among these were those for wheat, corn, oats, rice, hay, tobacco, peanuts, potatoes, fruits, vegetables, milk, eggs and meat. When World War II began there was some doubt among agricultural authorities whether an increase of more than 20% could be obtained in view of the loss of fertility of many areas, the shrinking labour supply on farms, limited machinery and other handicaps to agriculture. In contrast to this view the attainment of a 30% increase was even more remarkable.

**The Farm Labour Shortage.**—The farm population of the U.S. declined steadily both in actual numbers and in percentage of the total population of the country during World War II. After 1940 the total decreased 16.8%. The loss was only 1.3% during 1944 for the country as a whole and some regions reported a gain. The farm labour force lost almost 2,000,000 to the armed forces and a larger number to nonfarm work which were replaced by older men and women and younger boys and girls taking up regular farm work. The use of modern tractor machines favoured this since young women made useful tractor drivers. The reported farm employment including both family workers and hired workers averaged 11,300,000 persons in 1935-39 and 10,700,000 in Nov. 1945. The number of family workers declined more than the number of hired workers, supporting the general reports that farm owners and their families worked much longer hours than the hired labourers. While the use of imported labour and prisoners of war helped in many areas where a large amount of labour was needed for short periods, it was not important from a national standpoint since the total in any one year was only about 175,000 men. The seasonal help by school children and others in fruit harvest was likewise only of local importance. The fact that the greatly increased production was achieved with the limited labour is only explained by the use of labour-saving machinery which was adopted after 1935.

The mechanization of farming, next to the eight years of favourable weather, was an important factor in reaching the large production record. About 1,500,000 tractors and 1,000,000 trucks were reported on U.S. farms when World War II started in 1939. This represented motorized equipment on a majority of the larger farms that produced 80% of the marketable supply of farm products. Since the tractor enables a farmer to handle about three times more land than with horsepower, the manpower shortage was made up by machines. Early in World War II the manufacture of farm machinery was restricted to 23% of the 1940 output but this was later raised to 80% when the need for it became evident to the government. Power machinery was not so important in World War I since draught horses were still being used and farm labour was more plentiful. The better results secured with machines led to a strong postwar demand for power machinery.

Science contributed no small part to the expansion of food production. New varieties of crop gave increased yields; better cultural methods and the use of soil improvement practices also were favourable. The corn crop record was largely due to the high yields secured from hybrid seed which was used in about 80% of the corn area in the corn belt. In Iowa where 99% of the acreage is planted with hybrid seed the yield was 46.5 bu. per acre compared with 32 bu. per acre in 1935. Similar increased yields were recorded for other crops which together make up an estimated 20% of the gain in crop production.

**Agriculture's Financial Reserves.**—The large volume of production, high prices and unlimited demand resulted in the largest gross and net income in the record of U.S. agriculture. While high prices were not offered as an incentive to production in World War II as in World War I, the guarantee of parity prices, special subsidies, etc., served to give farmers assurance of certain returns. Gross farm income increased by large steps from \$10,000,000,000 to \$13,800,000,000 in 1941, \$18,399,000,000 in 1942, \$22,775,000,000 in 1943, \$23,446,000,000 in 1944 and \$24,200,000,000 in 1945. After deducting the costs of production, changes in inventories and other deductions, the net return for labour and investment was estimated to be about 70% of the gross income. Out of this income farmers had paid off mortgage indebtedness by 1944 to reduce the total to 12.4% of the value of farm real estate covered compared with 20% in 1939. In four years farmers' equities in nonreal estate holdings had increased from \$16,000,000,000 to \$33,000,000,000 while their equities in real estate had increased from \$25,000,000,000 to \$40,000,000,000. Agriculture as a whole had become an \$80,000,000,000 industry.

Summarizing the role that agricultural production played in World War II the following definite conclusions are outstanding: American agriculture provided the vital supplies of food and materials to supply the Allies with quantities to maintain their armies and civilians in vigorous action to win the conflict. The output of food and other products was expanded to exceed all previous records. The shortage of labour was made up by the use of power machines accumulated over a decade. New varieties of crops, better methods with livestock and other new applications of scientific knowledge attained record yields. The larger income enabled agriculture to reduce a large part of its indebtedness and to accumulate capital reserves for future improvements.

**Food and Agriculture Organization (F.A.O.).**—This section of the United Nations organization was started at the Conference on Food and Agriculture held at Hot Springs, Va., May 18-June 3, 1943, convened by an invitation of the U.S. government. The purpose was to consider freedom from want in relation to food and agriculture. After a discussion of the current and prospective food situation and the general needs of world agriculture, the conference agreed upon these general objectives for each member nation: (1) to raise the levels of nutrition and standard of living of all people; (2) to improve the efficiency of agricultural production and distribution; (3) to co-operate with other nations to achieve these ends; and (4) to report periodically on action taken and progress achieved. The conference recommended that the governments and authorities represented establish a permanent organization in the field of food and agriculture. An interim commission, including one member of each of the 44 governments, was set up to prepare a plan and constitution for the permanent organization. This commission worked in Washington, D.C., from July 1943 to Oct. 1945. On Aug. 1, 1944, it proposed the constitution which was circulated to the various governments for ratification. It became effective when ratified by 20 countries by the middle of 1945 and plans were made for the first meeting of F.A.O. at Quebec, Canada, Oct. 16-29, 1945.

At this first conference the constitution was formally signed by the following countries: Australia, Belgium, Bolivia, Brazil, Canada, China, Colombia, Cuba, Czechoslovakia, Denmark, Dominican Republic, Ecuador, Egypt, France, Greece, Guatemala, Haiti, Honduras, Iceland, India, Iraq, Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Panama, Peru, Philippines, Poland, Union of South Africa, United Kingdom, United States of America, Uruguay and Venezuela. Other nations indicated their intention to sign in 1946.

Delegates of 40 nations were present with staffs of advisors representing all branches of agriculture including forestry, fisheries and nutrition. A program of work and a general plan of organization were prepared in general terms for the permanent organization. An executive committee of 15 members was elected. Sir John Orr of Scotland, eminent nutritionist and member of parliament from Aberdeen university, was chosen to be the first director general. The interim committee was terminated by the Quebec conference and part of its staff taken over by the new officers to begin organization work. Offices were opened at Washington, D.C. to be used until the seat of the United Nations organization should be decreed, since the F.A.O. would locate at the same place. **Air Conditioning.** The principal limitation orders affecting the manufacture and sale of air conditioning equipment in the United States during wartime continued in effect for the first four months of 1945. The termination of World War II permitted the removal of most of the remaining orders, including the Controlled Materials plan, by October. However, the scarcity of critical materials and labour made it

## 34 AIRCRAFT CARRIERS—AIRPORTS AND FLYING FIELDS

difficult to resume production on items that were previously prohibited by the War Production board, such as room air conditioners.

Statistics on the number and horsepower of air conditioning installations in the U.S. published through 1941 by the Edison Electric institute were not maintained from 1942 through 1945 because of the small volume of residential and commercial installations and the difficulty of maintaining such statistics in wartime.

Statistics on shipments of commercial refrigeration and air conditioning equipment for the years 1940 and 1944 were released by the U.S. bureau of the census in co-operation with the War Production board. Since refrigeration machinery can be used both in refrigeration and air conditioning applications, it was impossible to determine accurately the relative production of air conditioning equipment without the aid of installations statistics such as those previously maintained by Edison Electric institute. However, some deductions can be made from the following facts.

The dollar value of air conditioning and commercial refrigeration unitary equipment shipped during 1944, including special military items, approximated \$53,000,000 as contrasted with \$75,000,000 in 1940.

The number and value of commercial type self-contained air conditioning units, which comprise only a portion of all air conditioning units, were 4,468 in 1944 as contrasted with 5,880 in 1940; the dollar values were \$3,614,646 and \$4,466,926, respectively.

In 1940 the number of self-contained air conditioning systems represented approximately 25% of an estimated number of installations of 24,000 in the U.S. However, on the average, the self-contained units were smaller in capacity so that they represented only 13% of the installed horsepower; self-contained units amounting to 28,000 out of 223,000 total horsepower installed in 1940.

Statistics for 1945 were not available, but there was good evidence that these quantities and values would be substantially higher than in 1944. Sales of commercial type self-contained air conditioners might double 1940 sales. Offsetting this was the fact that practically no room air conditioners were manufactured.

The installations of air conditioning equipment in the first half of 1945 were principally for military and industrial applications. By contrast, the industrial applications of air conditioning in 1940 amounted to only 6% in number and 9% in horsepower of total installations. (See also METALLURGY; PUBLIC HEALTH ENGINEERING.)

**Airports and Flying Fields.** The general transition in the United States from war to peace during the latter part of 1945 was well illustrated by the large increase in the total number of smaller airports in existence toward the end of the year.

The Civil Aeronautics administration classifies airports, for planning and statistical purposes, according to the effective length of the area available for take-off or landing. Class 1 airports must have, at sea level, a usable landing strip of from 1,800 ft. to 2,499 ft. in length; class 2 from 2,500 ft. to 3,499 ft.; class 3 from 3,500 ft. to 4,499 ft.; and class 4 from 4,500 ft. upwards. The existence or absence of other facilities, such as paved runways, night lights, radio, hangars, and fuelling equipment does not affect the classification. There follows a com-

parison of the number of airports in the U.S. by classification for the periods indicated:

	Dec. 1, 1942	Dec. 1, 1943	Dec. 1, 1944	Dec. 1, 1945
Class 1 . . . . .	1,593	923	1,170	1,550
Class 2 . . . . .	688	786	917	1,054
Class 3 . . . . .	306	418	463	479
Class 4 . . . . .	199	561	799	834
Total . . . . .	2,786	2,688	3,349	3,917

Airports are also grouped under types of ownership or control and the ratios for the various groups are as follows:

	Dec. 1, 1943	Dec. 1, 1944	Dec. 1, 1945
Municipal, commercial and private . .	66.6%	62.1%	68.6%
Armed services . . . . .	22.3	29.8	23.6
Other federal . . . . .	11.1	8.1	7.8
	100.0%	100.0%	100.0%

Federal interest in the continued development of airports of all types was shown by the action of the U.S. senate and house of representatives in passing bills authorizing federal assistance to states and municipalities for the construction or improvement of public airports. These bills, in general, follow the recommendations for assistance which the Civil Aeronautics administration made in a report to the congress in 1944. At the end of 1945 the senate and house bills were being brought into agreement through congressional legislative conference action.

The movement, started in 1944 by groups in the aviation industry to promote the establishment of many small airports for personal plane use, was continued throughout the year, and there developed a growing awareness among the progressive municipal officials of the problem which would face them in the future if airports were not included in the general community plan. Several large urban regions prepared and released during the year specific studies of their airport requirements and plans for fulfilling these needs as the demand develops.

In 1944 the Andrew J. Haire award for outstanding developments in the field of airports was established. This award, which consists of three major prizes and ten smaller ones, is judged by a committee of the National Aeronautic association. One of the principal Haire awards in 1945 was given for the development of a regional airport plan for the Detroit area. The other two principal awards were made for efficient airport operation and maintenance and for an effective promotional campaign for financing public airport construction.

The lifting of censorship restrictions on radar development during the war permitted the release of information on a great variety of equipment which had good possibilities of solving the problem of maintaining a volume of plane movements in and out of airports under instrument flying conditions comparable to

THE "LILY," portable seadrome released from the British secret list in 1945, was invented by R. M. Hamilton. Buoyancy cans, hexagonal at the surface, are so linked that they can give with the sea's motion and also receive the weight of heavy aircraft

the rate handled in contact flying weather.

Many airports built for war purposes were declared surplus during the latter part of the year and others would enter this category in 1946. The disposal of surplus airports was the responsibility of the Surplus Property administration in accordance with the provisions of the legislation creating that office. The Civil Aeronautics administration acts in an advisory capacity to the Surplus Property administration in connection with the disposition of surplus property on or adjacent to airports, as well as surplus airports themselves.

While the greatest increase in the number of airports took place in the smaller airports, the rapid growth in volume of air transport activities at the designated air carrier airports brought to the attention of many air travellers the deficiencies in airport terminal buildings, which had been apparent to the industry for some time. During the war a large number of the airports used in air transport operations were improved in order to accommodate military and naval aircraft. However, these improvement projects were, for the most part, limited to the actual landing facilities such as longer and heavier runways, wider taxiways, larger aprons, better lighting, improved drainage and new radio aids. Very little was done to improve the airport terminal buildings, with the result that in general the airport operating capacities were increased except for the bottleneck of the airport terminal buildings. (See also AVIATION, CIVIL; AVIATION, MILITARY.) (J. B. Bd.)

**Air Transport Command.** During the first six months, 1945, ATC, a major command unit of the U.S. army air forces, attained its peak war-time operations, carrying high priority matériel and personnel over a world-wide network of 188,000 route miles. Utilizing mass air transport techniques developed after ATC's inception on May 29, 1941, its record during that half-year period signaled a new aviation era.

ATC planes, principally C-54s, C-87s, C-47s and C-46s, flew 2,000,000 mi. every 24 hours, mostly over foreign lands. They carried during this six-months' interval, 1,141,700 passengers more than 2,240,880,000 passenger miles. Freight hauled over 788,212,000 ton miles included 438,300 tons of war matériel, 37,500 tons of government and troop mail, and 223½ tons of whole blood plasma. Peak haulage over the treacherous India-China hump for the month of July alone totalled 71,000 tons. Additionally, ATC had ferried a grand total of 50,000 combat aircraft abroad by June 1945; and had made more than 200,000 domestic deliveries.

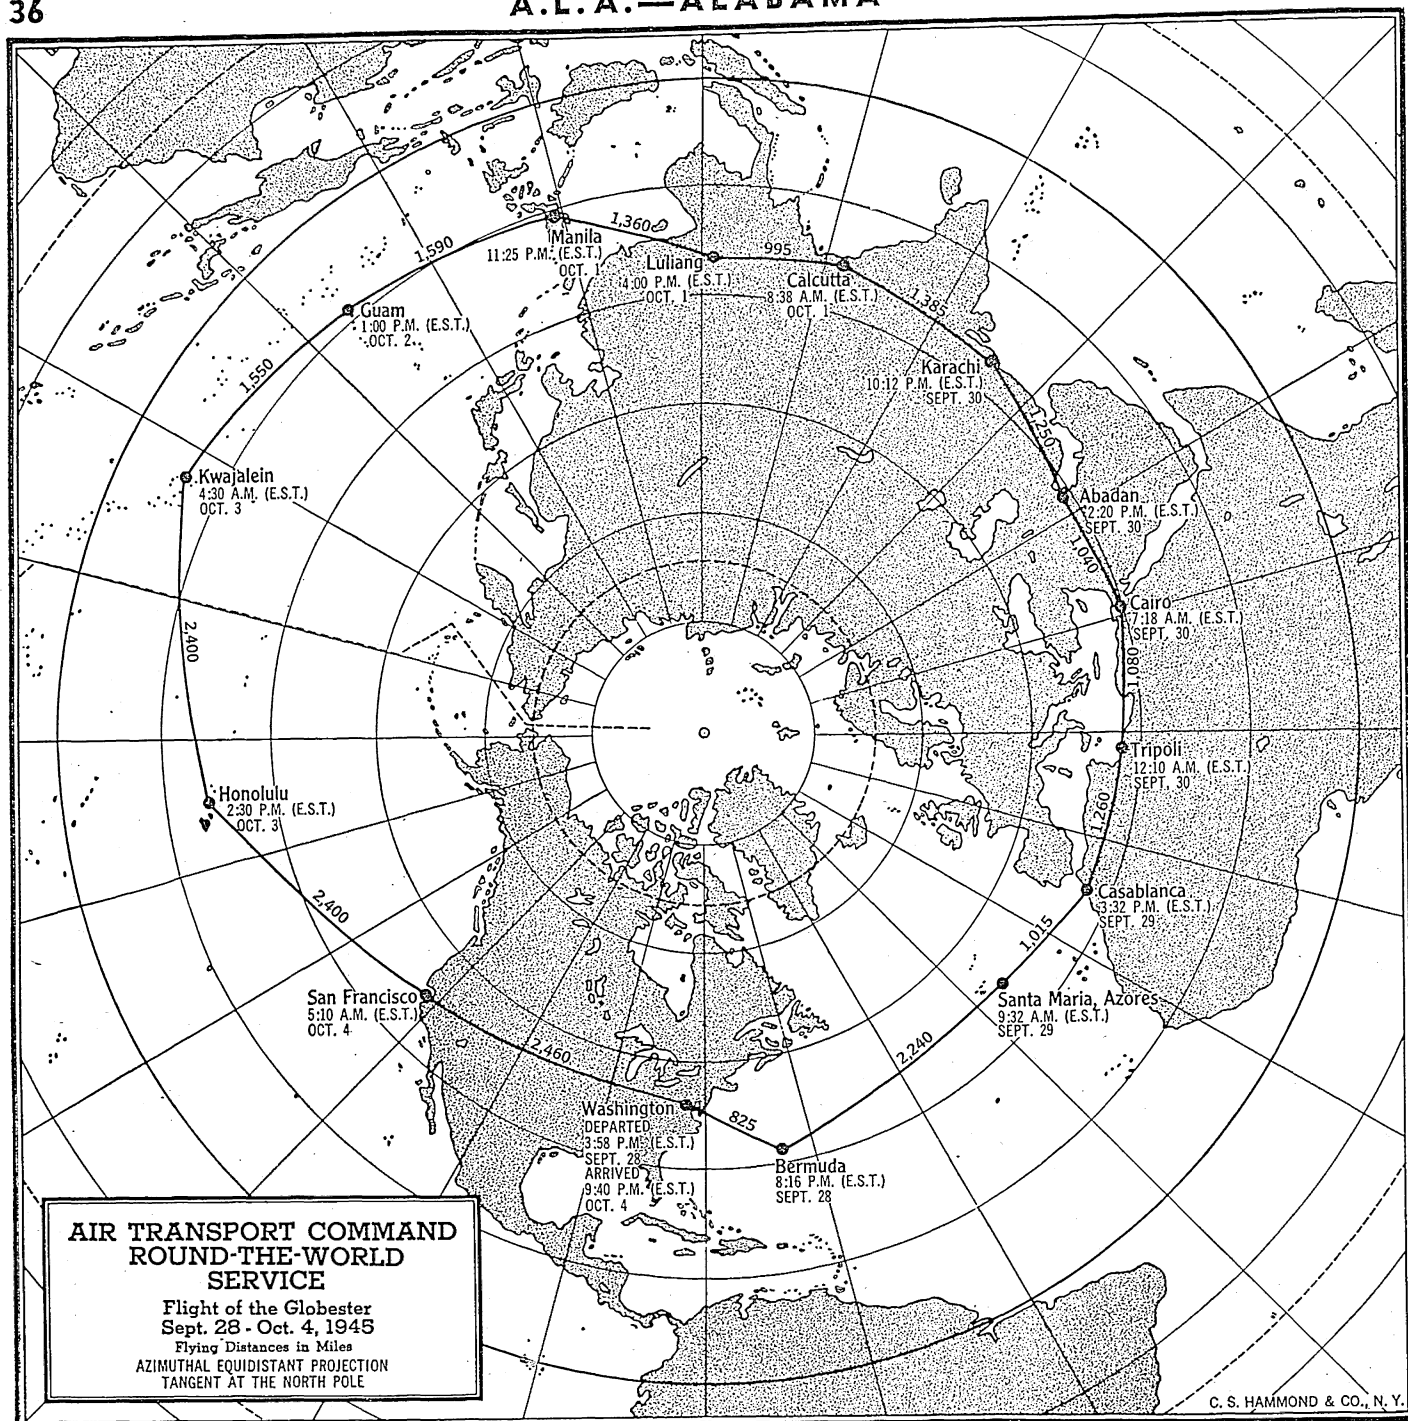

NORTHWEST FIELD, giant base on Guam for B-29 Superfortresses, was put in operation June 1, 1945. From here the big planes took off to bomb Japan. The 8,500-ft. runway and the more than 200 hardstands are of asphaltic concrete. Ten battalions of Aviation Engineers and Seabees built the field in three months.

Air evacuation of sick and wounded and redeployment of tactical aircraft and troops were major 1945 operations. During the first six months of 1945, ATC flew 133,400 air evacuees a total of 393,567,000 patient miles, including 39,000 between foreign points, 50,400 returned to the U.S., and 44,000 in domestic movements. During the two and one-half months following V-E day, ATC also had flown 67,200 redeploying troops from the European and Mediterranean theatres and supervised return flights of 3,425 heavy bombers with 58,170 crew members and passengers. During June, ATC planes crossed the Atlantic one every eight minutes.

As World War II ended, ATC was operating 2,700 aeroplanes, mostly major transports, with more than 200,000 military personnel scattered through all continents. All main routes were complete with maintenance facilities, communications, freight depots, hotel facilities for passengers, finance exchanges, air-sea and jungle rescue units, agricultural projects, recreational programs and specialized schools. In addition, ATC supervised all U.S. air priorities and maintained contracts with civilian air lines for additional operations.

ATC aerial supply extended rapidly behind advancing combat units, with its C-54s only eight days behind the first wave to hit Okinawa and the first A.A.F. planes on the island. ATC

planes were the first to land on defeated Japan, carrying advanced surrender-acceptance parties.

Under Lt. General Harold L. George, commanding general, ATC's Washington headquarters direct nine divisions, the Ferrying division, including domestic transport, and eight foreign divisions (Caribbean, Alaskan, South Atlantic, North Atlantic, Pacific, European, North African and India-China).

Major ATC operations during the latter months of 1945 included continuing redeployment; aerial services to occupational forces in all theatres, and demobilization and reorganization toward peacetime requirements.

(H. L. G.)

**A.L.A.:** see AMERICAN LIBRARY ASSOCIATION.

**Alabama.** Alabama, located in the east south central division of the United States, commonly called the "Cotton State," was admitted to the Union Dec. 14, 1819, as the 22nd state. Area: 51,609 sq.mi.—51,078 sq.mi. of land and 531 sq.mi. of water. The population in 1940 was 2,832,961;

the 1944 estimate, 2,818,083. Of the 1940 population, there were: 1,849,097 whites, 983,290 Negroes and 574 other persons; 2,821,004 native-born and 11,957 foreign-born. In 1940, 30.2% of the population was urban; 69.8%, rural. The capital city, Montgomery, in 1940 had a population of 78,084. The chief other cities were Birmingham (population of 267,583 in 1940) and Mobile (78,720).

**History.**—The legislature met in regular session from May 1 to June 29, 1945, inclusive, introducing 993 bills, passing 437 acts and proposing 10 amendments to the state constitution, 9 of which were not to be voted upon by the people until 1946. The defeated proposed constitutional amendment voted upon on Oct. 2, 1945, proposing to change the disposition of the state income tax revenues, received 42,368 votes for and 75,308 votes against. Incumbents of principal elective offices of the state government for the year were: Chauncey Sparks, governor; Handy Ellis, lieutenant-governor; William N. McQueen, attorney-general; John Brandon, state auditor; Joe N. Poole, commissioner of agriculture and industries; Gordon Persons,

chairman, Public Service commission; Sibyl Pool, secretary of state; Walter C. Lusk, state treasurer; Elbert B. Norton, state superintendent of education.

**Education.**—During the academic year 1944-45, there were 3,862 public schools which enrolled elementary students and 1,941 which enrolled secondary students; 1,805 of these schools were attended by both elementary and secondary pupils; therefore, the net total of separate public elementary and secondary schools was 3,998. There were 12,523 elementary and 6,908 secondary teaching positions in the public schools. Enrolment was 451,984 in the public elementary grades and 195,570 in the secondary grades. Institutions of higher learning included: the University of Alabama, Tuscaloosa; Alabama Polytechnic institute, Auburn; Alabama college, Montevallo; Agricultural and Mechanical institute, Normal (Negroes); and five state teachers' colleges, at Florence, Jacksonville, Livingston, Montgomery (Negroes) and Troy.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Amounts spent for public assistance categories in Alabama during the fiscal year ending Sept. 30, 1945, and the number of recipients (in parentheses) during Sept. 1945, were as follows: old age assistance, \$5,897,676 (32,590); aid to the blind, \$145,124 (767); aid to dependent children, \$1,511,965 (5,342); aid to children in foster care, \$103,876 (286); aid to the handicapped, \$497,921 (3,150); temporary aid, \$25,257 (134). During 1944-45, unemployment compensation payments were \$1,593,116 to an estimated total of 20,000 beneficiaries. Estimated 1944-45 expenditures, excluding those for industries operated for profit, of the several state correctional agencies and their inmate populations on the 1945 dates shown, were: state department of correction and institutions, \$1,800,000, 3,654 inmates on Sept. 30; Alabama Boys' Industrial school, \$134,792, 244 inmates on Nov. 30; state training school for girls, \$61,118, 130 inmates on Nov. 30; Alabama Reform school for Negroes, \$61,000, 335 inmates on Aug. 31.

**Communications.**—Highways and roads consisted of 7,050 mi. in the state system, 52,554 mi. in county systems, and between 4,000 and 5,000 mi. in municipal systems. State government expenditures for the purpose of highways, excluding highway debt service, during the fiscal year ending Sept. 30, 1945, were \$11,108,251. Miles of railroads were approximately 6,724. There were about 1,490 mi. of navigable rivers. Total airway mileage on Dec. 1, 1945, was 1,487; the number of used airports, 49; the number of unused airports, 16. The approximate number of telephones installed on Sept. 30, 1945, was 208,397.

**Banking and Finance.**—On June 30, 1945, there were in Alabama: 151 state banks and one branch, which had total deposits of \$340,998,486 and total assets of \$361,972,820; 65 national banks and 19 branches, which had total deposits of \$762,251,849 and total assets of \$807,756,498; 8 state savings and loan associations with free shares of \$2,866,975; 17 federal savings and loan associations with free shares of \$19,705,000. According to best available estimates: total net state government receipts in the fiscal year ending Sept. 30, 1945, were \$95,000,000; total net disbursements were \$82,000,000; state bonded indebtedness on Sept. 30 was \$56,252,000; state cash and investment balances on Sept. 30 were \$72,500,000.

**Agriculture.**—The value of Alabama's crop production in

Table I.—Leading Agricultural Products of Alabama, 1945 and 1944

Crop	1945	1944	Value—1945
Cotton, bales . . . . .	935,000	1,006,000	\$104,720,000
Corn, bu. . . . .	50,626,000	48,128,000	72,901,000
Peanuts, lb. . . . .	339,300,000	327,600,000	27,144,000
Tame and wild hay, tons . . . . .	816,000	747,000	20,155,000
Cottonseed, tons . . . . .	359,000	...	18,309,000
Sweet potatoes, bu. . . . .	6,375,000	...	13,388,000
Potatoes, bu. . . . .	5,200,000	...	9,100,000
Oats, bu. . . . .	5,275,000	4,608,000	5,328,000
Peaches, bu. . . . .	2,440,000	...	5,002,000

1945 was \$293,178,000. A total of 6,955,000 ac. was harvested. Cash income from sale of crops, livestock and livestock products for 1944 was \$261,086,000; the value of home consumption of crops, livestock and livestock products was \$96,673,000; income from government payments was \$14,874,000. The 1945 season was favourable for the production of most crops.

**Manufacturing.**—The total estimated value of manufactures in Alabama in 1939 was \$574,670,690. The 2,051 manufacturing establishments working 8 or more persons in 1944 had 255,196 employees, to whom they paid wages of \$463,153,086.

Table II.—Principal Industries of Alabama, 1939 and 1937

Industry	Value of Products 1939	1937
Cotton broad woven goods . . . . .	\$75,044,582	\$ . . . .
Cotton woven goods (over 12" in width) . . . . .	37,085,389	93,390,182
Blast furnace products . . . . .	32,512,574	39,629,075
Sawmills, veneer mills, cooperage mills, stock mills, lumber and timber products, etc. . . . .	30,662,008	31,915,650
Cast iron pipe and fittings . . . . .	20,138,932	28,104,450
Oven coke and coke-oven by-products . . . . .	14,077,102	23,579,609
Cotton yarn and thread . . . . .	11,239,523	17,183,094
Meat packing, wholesale . . . . .	10,756,520	8,852,612
Cottonseed oil, cake, meal, and linters . . . . .	9,453,063	19,681,409
Fertilizers . . . . .		8,871,151

**Minerals.**—The value of Alabama mineral production in 1943 was \$102,584,000.

Table III.—Principal Mineral Products of Alabama, 1944 and 1943

Mineral	Value, 1944	Value, 1943
Coal . . . . .	\$73,701,000	\$59,145,788
Iron ore . . . . .	17,684,154	21,047,231
Cement . . . . .	6,777,741	10,943,926
Stone . . . . .	3,385,801	3,178,908

(C. Ss.)

**Alaska.** Alaska is one of the two incorporated territories of the United States. The territory lies between the meridians of 130° W. and 173° E. longitude and between the parallels of 51° and 72° N. latitude. It has an area of 586,400 sq.mi. (land, 571,065 sq.mi.) and a civilian population of 72,524 (1939 census). The capital is Juneau, with a population of 5,729; other chief cities are Ketchikan, population 4,695; Nome, 1,559; Anchorage, 3,495; and Fairbanks, 3,455.

**History.**—In 1945, the legislature enacted an antidiscrimination law, being the first territory or state of the United States to enact such a law. It created an Alaska Development board, aimed at further industrial development. It created for the first time in the territory a department of agriculture for the purpose of helping in developing farming and assisting new settlers. The legislature extended the voting franchise to 18-year-old residents, subject to validation by the congress.

Army and navy operations in Alaska were sharply curtailed with the end of World War II in 1945. Many huge airfields, which had been built and operated by the army, were being unmanned by the military and turned over to the Civil Aeronautics authority. Three major army field installations at Fairbanks, Anchorage and Nome were still being operated by the army. The navy had moved its 17th naval district from the Aleutian chain to Kodiak island where it was making a permanent installation.

Principal officers of the territory in 1945 were: Ernest Gruening, governor; Edward L. Bartlett, delegate to congress; Llewellyn M. Williams, secretary of Alaska; Ralph J. Rivers, attorney-general; Oscar G. Olson, treasurer; W. Leonard Smith, highway engineer; Frank A. Boyle, auditor; James C. Ryan, commissioner of education; George W. Gasser, commissioner of agriculture; Walter P. Sharpe, commissioner of labour.

**Finance.**—Alaska has no public debt. Its bank balance at the end of 1945 was \$1,112,000.

**Fisheries and Fur Production.**—The fishing industry produced 4,500,000 cases of salmon during the 1945 season. Between 40,000,000 and 50,000,000 lb. of halibut were taken from Alaskan waters during the year. Fur seals taken under govern-

ment supervision from the Pribilof Islands had a value of approximately \$1,000,000 in 1945. Other furs, such as mink, otter, fox, ermine and marten, taken were valued at \$2,000,000. At a December fur sale in Alaska, mink brought as high as \$35 per pelt and beaver brought an average of \$60, one of the highest prices on record.

**Education.**—Forty-four rural and 18 city schools were maintained in the territory during 1945, employing more than 300 teachers and with a total enrolment of 5,000 pupils. In addition, the Alaska native service, department of the interior, maintained 119 day schools and 3 vocational high schools for native children.

**Mineral Production.**—Mining, which had been discontinued during World War II except in the field of strategic metals, began to show signs of renewed life at the end of 1945. The ban on gold mining was lifted. Large and small placer operators in the gold regions of Seward peninsula and the Fairbanks-Jack Wade district were getting equipment in shape and crews assembled to resume prewar operations. No hard rock mines had yet opened but the Alaska Juneau mine, largest low-grade gold ore mine in the world, expected to be in operation by 1946.

**FILMS.**—*Alaska; Eskimo Children* (Encyclopædia Britannica Films Inc.). (L. M. W.)

**Alaska Highway:** see ROADS AND HIGHWAYS.

**Albania.** Albania, a republic (proclaimed Jan. 1946), formerly a kingdom in the western part of the Balkan peninsula. Area 10,631 sq.mi.; pop. (census 1930) 1,003,068; (estimate 1939) 1,063,000. Capital, Tirana. Chief cities (1930 census): Tirana (30,806); Scutari (29,209); Koritsa (22,787); Elbasan (13,796); Valona (9,100). Religion: Mohammedans (688,280); Orthodox Christians (210,313); Roman Catholics (104,184). Prime Minister (1945): Enver Hoxha.

**History.**—After the Germans were driven from Albania in Nov. 1944, the Peoples Liberation army, founded on July 10, 1944, established a government of the "Popular Front." The head of the government was Col. Gen. Enver Hoxha who was at the same time minister of war and commander in chief of the Albanian army. His government, which looked to Moscow for guidance, resembled in its complexion the government of Marshal Tito in Yugoslavia. Hoxha, a 36-year-old former school-teacher, glorified in his speeches Marshal Stalin's Russia and Marshal Tito's Yugoslavia as examples of true democracy.

The Albanian government demanded the invitation of Albania to the conference of the United Nations in San Francisco, Calif. This demand, transmitted to the world by the Russian and Yugoslav radios, was rejected. On May 8, 1945, an informal United States mission under John F. Jacobs entered Albania to survey conditions. On Aug. 1, an agreement was signed between the Albanian government and Col. D. R. Oakley Hill, chief of the United Nations Relief and Rehabilitation administration in Albania, according to which the U.N.R.R.A. would furnish Albania with food, textiles, engineering equipment and medical and agricultural supplies which would be distributed "without discrimination" by Albanian authorities. Between April 11 and June 30, 1945, military liaison brought 9,500 lb. of supplies and 334 vehicles into Albania to alleviate the situation. On Nov. 10, 1945, the U.S., Great Britain and Russia recognized the existing Albanian regime. Elections at the end of November confirmed the Hoxha regime.

The Albanian government addressed itself to the United Nations committee on war criminals with a formal request that the three former Italian administrators in Albania, Francesco Jacomini, Salvatore Mellone and Gen. Cristino Agostinucci be handed over to the Albanian government for trial in Albania.

No action was taken by the Allied Powers on this request.

The Greek government and Greek circles had repeatedly claimed that the Greeks residing in the northern Epirus, which forms the southern part of Albania, were suffering from "Albanian terrorism." The demand was raised for the dispatch of Allied troops into that area to protect the lives and properties of the Greeks, and for the incorporation of the northern Epirus into Greece. That territory was occupied by the Greeks in 1913 and in 1918, but both times they were expelled upon Italian insistence. The Greek foreign minister, John Politis, claimed that Italian imperialism had secured the subjection of Epirus to Albania and had used it as a springboard for the invasion of Greece. During the war of Italian aggression against Greece in 1940-41, the Greeks succeeded in invading northern Epirus and in administering that part of Albania until the collapse of Greece under German pressure.

**Education.**—Though primary education is nominally compulsory, illiteracy was still very high in 1945, especially among women. In 1939 there existed 663 state elementary schools with 38,988 male and 17,948 female pupils and 19 secondary schools with 4,810 male and 1,425 female students. There were no institutions of higher education.

**Trade and Finance.**—The value of the foreign trade for 1938 amounted to \$9,644,000. Imports amounted to \$6,719,000 of which 37.2% came from Italy and 6% from the U.S. The total exports amounted to \$2,925,000, of which 68.4% went to Italy and 4.5% to the U.S. The major import articles were cotton and cotton goods, corn, benzine and woollen goods; the main exports were wool, hides and furs, cheese, cattle, eggs and bitumen. Of the mineral wealth of the country aluminum and petroleum were of importance. In 1939, 229,278 short tons of crude petroleum were produced. With the economic life of the country still on a very primitive level there exists practically no modern industry. Albania has no railroads but a good highway system, improved by the Italians for strategic reasons. The Albanian currency in 1943 was pegged to the Italian currency, an Albanian franc equalling 6.25 lire (32.89 cents U.S. June 1941). (See also ITALIAN COLONIAL EMPIRE.) (H. Ko.)

**Alberta.** The most westerly of the three prairie provinces of Canada (*q.v.*), Alberta was created a province by parliament in 1905. The area is 255,285 sq.mi.; pop. 796,169 (1941 census), of which 489,583 was rural. The largest city is Edmonton, the provincial capital (93,817). Local administration is in the hands of a provincial parliament consisting of a lieutenant governor, executive council and legislative assembly of 63 members. Alberta is represented at Ottawa by 17 members in the house of commons and 6 senators.

**History.**—Throughout 1945, the Social Credit party under Hon. E. C. Manning continued in office. Following the dominion general elections on June 11, Alberta returned the following candidates: Social Credit 13; Liberals 2; Progressive Conservatives 2.

**Education.**—In the school session 1941-42, the enrolment of pupils in all educational institutions was 179,679. The total revenue for provincially controlled schools in 1943 was \$11,996,605. The University of Alberta, with its seat at Edmonton, is the provincial university.

**Agriculture.**—In 1944 the total value of agricultural production was \$420,111,000; farm income, \$314,100,000. In the same year, Alberta produced 10,000,000 lb. of dressed poultry. For 1945 the wheat crop was estimated to be approximately 83,000,000 bu. The total value of field crops in 1945 was set tentatively at \$177,061,000 (1944, \$237,869,000). Inspected slaughterings of livestock during the first 50 weeks of 1945 were: cattle 308,538; calves 71,677; hogs 1,434,677; sheep 108,047.

**Minerals.**—In the period Sept. 1944-Sept. 1945, coal production was 5,617,775 tons (1943-44, 5,240,353 tons). In 1944 oil production was 8,788,276 bbl. Active prospecting for petroleum continued throughout 1945, the Shell Oil company filing reservations for about 142,236 ac. in the Two Hills and Myrnam regions.

**FILMS.**—*Prairie Provinces* (Encyclopædia Britannica Films Inc.). (J. I. C.)

**Alcan (Alaska) Highway:** *see* ROADS AND HIGHWAYS.

**Alcohol, Industrial.** The production of industrial alcohol in the United States dropped rapidly following the end of World War II. The passing of the emergency brought a change in costs and uses of such raw materials as grains, molasses and sugar. The rubber industry turned to petroleum products and the future of grain alcohol became greatly limited. Stocks were greatly reduced by the end of 1945 because of the unsettled situation. With the need for alcohol for munitions manufacture ended and rubber makers turning to petroleum sources, the alcohol plants of the Defense corporation were being considered for reconversion for other purposes.

The use of grain for alcohol making was limited by the greater need for grain as food and feed. About 85,000,000 bu. of wheat were used for alcohol in the year ending in July 1945, compared with 140,000,000 bu. used in 1944. The use of corn was restricted early in the year because of the poor outlook for the new crop.

In July the secretary of agriculture announced that no corn could be used for either industrial or beverage alcohol.

Under normal conditions grains are too valuable to be used for alcohol making. The Defense corporation used one alcohol plant for experiments in producing grain alcohol by a new mould-bran method. This was said to lower the cost of production, but not sufficiently to let grain alcohol compete with that from other sources, such as low-grade molasses. The Defense Supplies corporation purchased all of the exportable supply of blackstrap molasses from the 1944-45 Cuban sugar-cane crop. The scarcity of sugar withheld most of this material from alcohol manufacture.

The expansion of alcohol production was one of the most remarkable of the war period. From an annual capacity of about 100,000,000 gal. in 1941 the output was increased to meet a demand for more than 600,000,000 gal. in 1944. By the use of grains in distilleries and in new plants the need was met, only to face, at the end of the war, an almost total loss of market. With the restoration of sugar production in two or three years, a normal industry was anticipated. (J. C. Ms.)

**Alcoholic Intoxication:** *see* INTOXICATION, ALCOHOLIC.

## Alexander, Sir Harold Rupert Leofric George

(1891- ), British military commander and governor-general of Canada, the 3rd son of the 4th earl of Caledon, was educated at Harrow and Sandhurst. Commissioned in the Irish guards in 1911, he commanded a battalion of his regiment on the western front in World War I before his 26th birthday. He was wounded twice and won the D.S.O., M.C., and the Legion of Honour.

In 1939 he led the 1st division to France with the B.E.F. Later, given the 1st corps, he organized the final defense and evacuation of Dunkirk, and was among the last men to leave the beaches. Between Dec. 1940 and Feb. 1942, while general officer commanding in chief, southern command, he initiated in the battle school the new scheme of realistic training for scientific warfare. At the end of Feb. 1942 he arrived in Burma to extricate the hopelessly outnumbered British army from a campaign which was already lost. In Aug. 1942 he was sent to the middle east as commander in chief: under his direction the 8th army won the decisive victory of El Alamein and pursued the defeated German and Italian forces under Marshal Rommel to Tobruk, Bengasi, Tripoli and the border of Tunisia. Appointed deputy

commander in chief to General Eisenhower and field commander of the British, U.S. and French armies in North Africa, he coordinated and carried through the concentric Allied offensive in Tunisia which led to the fall of Tunis city and the axis surrender. As commander of the 15th British, Canadian and U.S. army group he directed the invasion of Sicily in July and the Italian mainland in Sept. 1943. Under his command the Anglo-American 5th army and the British 8th army (including also New Zealand, Canadian, South African, Indian, Polish, French and Italian formations) fought their way through Naples and Rome to beyond Florence and Rimini.

General Alexander was promoted field marshal with effect from June 4, 1944, the date of the capture of Rome. In Dec. 1944 he became supreme commander, Mediterranean theatre. It fell to him to establish friendly relations with Marshal Tito in Yugoslavia and Marshal Konev in Vienna and to deal with the civil war in Greece. As supreme commander he imposed unconditional surrender on the German southwestern armies in May 1945. In August he was appointed governor-general of Canada.

**Alexei** (SERGEI VLADIMIROVICH SIMANSKY) (1877- ), Russian ecclesiast, was born Oct. 27, in Moscow. He was graduated from the Moscow University Law school, 1899, and from the Moscow Ecclesiastical seminary, 1904, with a degree of doctor of theology. He was made a deacon in 1902, assuming the name Alexei, and became a priest the following year. Ordained a bishop in 1913, he later served as archbishop of Novgorod, 1932-33, metropolitan of Leningrad, 1933-43, and became metropolitan of Leningrad and Novgorod, 1943. After the German invasion in 1941, Stalin, in his efforts to rally all Russians against the invaders, relaxed his strong opposition to the church and ordered a quietus on the activities of the militant "Godless League." These moves facilitated resumption of religious activities in Russia, and the patriarch Sergei urged the faithful to join wholeheartedly with Stalin's efforts to repel the Germans. This policy was continued by Alexei, who remained in Leningrad during the siege to organize the church in support of the red army, for which he was decorated by the soviet government. In 1943, Alexei was made a permanent member of the Holy Synod. After the death of Sergei in 1944, Alexei was named acting patriarch of the Russian orthodox church, and was unanimously elected patriarch, Feb. 2, 1945.

**Alfalfa.** The alfalfa hay crop of the United States in 1945 was estimated at 33,671,000 tons, compared with 31,863,000 tons harvested in 1944 and an average of 28,604,000 tons 1934-43. The crop was larger than that of 1943. The acreage was 14,810,000 ac. compared with an average of 13,917,000 ac. 1934-43. Yields were estimated at an average of 2.27 tons per acre compared with 2.04 tons 1934-43. The crop was better than that of 1944 in almost all of the large producing states of the northwest central area except Iowa and Minnesota where the crop was slightly less. California, with its large part of the crop grown on irrigated land led with the largest yield of 4.20 tons per acre; Arizona 2.80; Texas 2.65; and Oregon and Washington with yields of 2.60 tons per acre. Wisconsin was not far behind with a yield of 2.55 tons and Connecticut on a small acreage produced an average of 2.5 tons per acre. There was generally favourable weather in almost all of the leading hay states.

Alfalfa seed production reflected the favourable year with an increase over 1944. The crop was estimated at 1,146,000 bu. compared with 1,142,000 bu. harvested in 1944 and an average of 1,178,700 bu. in 1934-43. The yield was 1.37 bu. per acre, better than 1944 but below the average of 1.63 bu. for 1934-43. The acreage harvested for seed was reduced to 835,400 ac. in

U.S. Production of Alfalfa Hay in Leading States, 1945 and 1944  
and the 10-Yr. Average  
(in thousands of tons)

State	1945	1944	10-yr. Average	State	1945	1944	10-yr. Average
California . .	4,171	4,106	3,304	Illinois . . .	1,289	1,041	1,024
Wisconsin . .	2,101	1,730	2,191	Montana . .	1,158	1,159	975
Iowa . . . .	1,999	2,041	1,940	Utah . . . .	1,007	1,040	927
Minnesota . .	1,993	2,090	2,234	Ohio . . . .	906	746	889
Nebraska . .	1,933	1,830	1,181	Indiana . . .	906	642	784
Idaho . . . .	1,795	1,814	1,814	Washington .	866	716	294
Kansas . . .	1,670	1,693	1,000	New York . .	835	847	700
Colorado . .	1,308	1,432	1,222	Missouri . .	822	806	576

1945 compared with 967,500 ac. in 1944. The heavy production centred in Kansas, 220,000 bu., Oklahoma 175,000 bu. and Nebraska 121,000 bu. Texas had a remarkable high yield of 4 bu. of seed per acre in 1945 compared with an average of 2.74 bu. 1934-43. (See also HAY.) (J. C. Ms.)

**Algeria:** see FRENCH COLONIAL EMPIRE.

**Aliens.** Alien Registration.—All aliens remaining in the United States for 29 days or longer are required to register under the provisions of the Alien Registration act of 1940. Statistical data concerning immigration and naturalization is compiled by fiscal and not calendar years. During the fiscal year ended June 30, 1945, there were 153,015 registrations recorded. An estimate based upon the alien registration records indicated that on June 30, 1945, there were in the United States 3,050,000 resident aliens. This estimate is based upon the initial registration of aliens taken during the period which began Aug. 27, 1940, and continued through Dec. 26 of that year. Net migration, naturalization and mortality factors were used in determining the estimate.

**Naturalization.**—Certificates of naturalization were issued in the United States and overseas to 231,402 persons during the fiscal year ended June 30, 1945. This is a marked decrease from the highest recorded figures of 441,979 certificates granted in the fiscal year 1944. Of the certificates issued in 1945, 208,707 were received by civilians. The nations to which new citizens formerly owed allegiance were: British empire 36,798; Czechoslovakia 5,561; Germany 42,720; Greece 3,838; Hungary 6,075; Italy 39,654; Poland 20,003; U.S.S.R. 11,714; Yugoslavia 3,614; all other countries 38,730. During the year 9,782 petitions for naturalization were denied; there were 7,297 denied in the fiscal year 1944.

The Second War Powers act, approved March 27, 1942, made available an expeditious naturalization procedure to noncitizens serving in the armed forces of the United States. The statute provided a judicial naturalization process for those residing within the jurisdiction of a naturalization court and an administrative naturalization process for those serving abroad. For the fiscal year 1945, 17,029 members of the military and naval forces residing in the United States, Alaska, Hawaii, Puerto Rico and the Virgin Islands were admitted to citizenship on the basis of petitions filed with naturalization courts. Such persons formerly owed allegiance to the following countries: British empire 4,914; China 367; Czechoslovakia 243; Germany 2,290; Greece 378; Hungary 204; Italy 1,562; Mexico 2,316; Poland 618; Switzerland 214; U.S.S.R. 334; all other countries 3,589. In addition, a total of 5,666 persons serving abroad with the armed forces of the United States were admitted to citizenship by designated representatives of the immigration and naturalization service under the administrative process. Naturalizations were granted in the following areas: England 997; France 1,208; Italy 727; other Europe 127; India 246; other Asia 115, Australia 444; New Guinea 1,411; other Pacific 239; all other countries 152. Among such petitioners naturalized were 1,899 subjects of the British empire, 326 Germans, 427 Italians, 191 Poles, 116 Russians, 590 Filipinos, 1,121 Mexicans and 92 Chinese.

There were 165 naturalization certificates judicially granted which were revoked during the year, a reduction of 73 as compared with the preceding fiscal year. In 122 cases the foreign service of the state department initiated the action because naturalized citizens of this country became permanent residents of foreign countries within five years after naturalization. In the remaining 43 cases the immigration and naturalization service initiated action because naturalization was fraudulently or illegally procured.

Nationality may be lost involuntarily through committing treason against the United States or attempting by force to overthrow, or bearing arms against the United States, provided there is conviction by court martial or a court of competent jurisdiction; through deserting the military or naval service of the United States in time of war, provided there is conviction by a court martial and dismissal or dishonourable discharge as a result of such conviction. Nationality may also be lost by departing from or remaining outside the jurisdiction of the United States in time of war or national emergency for the purpose of evading or avoiding training and service in the armed forces of the United States. In addition to approximately 5,000 U.S.-born Japanese, whose renunciation of citizenship was approved by the attorney general, there were 1,936 persons who expatriated themselves in 1945. Of these, 1,896 took affirmative action in a foreign country which resulted in loss of citizenship.

Petitions for naturalization, exclusive of overseas petitions by members of the armed forces, were filed by 195,917 persons. Declarations of intention filed in the fiscal year 1945 dropped to 31,195, the lowest number recorded after 1907, which was the first year in which consolidated statistical records of naturalization were made. There were 42,368 declarations filed in 1944, 115,664 in 1943, and 221,796 in 1942.

**Alien Enemies.**—Alien enemies included natives, citizens, denizens and subjects of countries with which the United States had been at war—Japan, Germany, Italy, Hungary, Rumania and Bulgaria. By authority of presidential proclamations of Dec. 7 and 8, 1941, and Jan. 14, 1942, a series of regulations was promulgated by the department of justice affecting the conduct of citizens and subjects of Japan, Germany and Italy, 14 years and older. (On Oct. 19, 1942, aliens of Italian nationality were

HARRY BRIDGES, Australian-born president of the Longshoremen's and Warehousemen's union, signing naturalization papers at San Francisco, Calif., on Sept. 17, 1945. On June 18, the supreme court ruled his deportation on charges of alleged membership in the Communist party to be illegal

excepted from the travel regulations prescribed for alien enemies by the attorney general.) The president, by proclamation on Dec. 12, 1945, revoked the regulations of Dec. 7 and 8, 1941, relating to the possession of certain prohibited articles, and to travel within the boundaries of the U.S.

During the fiscal year 1945 the population of alien enemy detention camps increased by 2,784, including 116 children born at the family internment camps. In the same period 1,658 were released from the camps, 792 for repatriation, 627 on parole, 88 for internment at large, and 119 by discharge. In addition, 32 died, leaving 7,364 in custody at the close of the fiscal year. Of this number there were 2,107 Germans, 25 Italians, 5,211 Japanese, 7 Hungarians, 2 Rumanians and 12 others. Of the total, 1,120 (197 Germans and 923 Japanese) were persons who applied for voluntary internment to join husbands or fathers in one of the family internment camps; 3,015 were persons apprehended in continental U.S. under presidential warrants; 733 persons were brought to continental U.S. from Alaska and Hawaii; 1,956 persons were brought to continental U.S. from Central and South America; 532 were seamen who were members of crews of enemy merchant vessels taken into custody in ports of the U.S. Seven detention centres were in operation at the close of the fiscal year, four having been closed during the year.

**New Legislation.**—The act of Dec. 19, 1944, eliminated in certain cases the liability of transportation companies to fines and penalties for bringing aliens to the United States without proper documents, and authorized the attorney general, in his discretion, to mitigate penalties incurred for failure to detain and deport alien seamen.

The act of Dec. 22, 1944, eliminated the requirement of lawful admission in the cases of naturalization applicants who entered the United States prior to Sept. 1, 1943, and who, during World War II, served honourably in the armed forces beyond the continental limits of the U.S.

The act of April 30, 1945, provided for the imposition of severe penalties for procuring or attempting to procure the escape of any prisoner of war or interned enemy alien held by the United States or any of its Allies.

The act of July 3, 1945, provided additional appropriation for the fiscal year ending June 30, 1946, on behalf of certain workers entering the United States temporarily to perform labour essential to the war effort.

The act of Oct. 11, 1945, amended the Nationality act of 1940 by providing that nationality shall not be lost under the provisions of sections 404 or 407 of that act by certain citizens residing abroad until the expiration of six years following the date the said Nationality act was approved.

The act of Oct. 29, 1945, amended the Immigration act of May 26, 1924, so as to add to the classes excludable on the ground of ineligibility to citizenship certain aliens of neutral countries who applied for relief from training and service in the armed forces of the United States.

The act of Dec. 28, 1945, expedited the admission to the United States of alien spouses and alien minor children of citizen members of the armed forces by exempting them from the usual documentary requirements and from exclusion on the ground of certain physical and mental defects. (See also CENSUS DATA, 1945; WAR RELOCATION AUTHORITY.)

(U. C.)

## Alimentary System, Disorders of. The Gastrointestinal Tract.

—The unprecedented progress made in knowledge of tropical diseases lessened to a great extent the concern of the medical profession about the threat of exposure offered by returning infected military personnel to the civilian population. Malaria, bacillary and amoebic dysentery, visceral leishmaniasis (kala-azar) and schistosomiasis are of special importance. Malaria, public enemy number one in this respect, may give rise to manifestations simulating those of acute abdominal disease. The sequelae of bacillary and amoebic dysentery are found chiefly in the intestinal tract and liver. Penicillin is an effective adjuvant to treatment for serious refractory amoebiasis. Early diagnosis and treatment of kala-azar and schistosomiasis minimize the damage to the liver and spleen. Among troops returned from the Mediterranean area, as well as among those returned from India, China, Africa or the near east, the possibility of these two diseases must be entertained in the presence of enlargement of the liver and spleen. Essentials to early diagnosis of visceral leishmaniasis, according to John Lowe, are the presence of irregular, intermittent fever, a relatively rapid pulse rate and absence of severe toxæmia. Additional

diagnostic aids are sternal puncture, with staining of specimens obtained by this means for *Leishmania donovani* and complement fixation tests with special antigens. Pentavalent antimony derivatives, such as neostibosan are used in the treatment of this disease for they proved to be the most effective and least toxic. It was estimated that more than 12.5% of the population of Puerto Rico are, or have been, afflicted with schistosomiasis. Fuadin has been used in treatment of this disease.

An awareness of the necessity for additional knowledge of the nervous system and its functions, to enhance further diagnostic acumen, was attested by increased activity in clinical and experimental research. Thomas M. Rivers' clinical investigations of pain produced by various lesions extending from the level of the oesophagus to the lower part of the ileum in man, and Walter Ganado's review are illuminating. The practical diagnostic aspects of abdominal pain, on the basis of contemporary research, have been considered in two short articles by Walter C. Alvarez. However, the fact remains that there were still in 1945 significant gaps in knowledge, particularly with respect to the splanchnic innervation of abdominal viscera and the pathways, connections and mechanisms that give rise to visceral pain. It appears that visceral pain is diffuse, is segmental in distribution and is referred to the level from which the viscus migrated in embryologic development. Thus, for example, the pain is epigastric in location if its cause is in the stomach; in the umbilical region, if the cause is in the small intestine, including the appendix, and in the hypogastric region, if the cause is in the colon or urinary bladder. The early pain of acute appendicitis is ascribed to excessive contraction of the muscular wall of the appendix. The later, local pain, usually in the right iliac fossa, is a somatic pain, attributed largely to chemical irritation of the adjacent peritoneum. In chronic appendicitis, the epigastric location of the pain is ascribed to reflex pylorospasm (the ileogastric syndrome of Braithwaite).

B. H. Kesert and M. O. Grossman reported encouraging results with intraspinal injections of thiamin chloride in the treatment of gastric crisis or lightning pains associated with tabes dorsalis (locomotor ataxia). The dose and number of treatments vary.

Chordotomy was advocated more frequently than before, for relief of intractable pain, particularly that due to inoperable carcinoma. Also, chordotomy was employed from time to time for relief of pain arising from irreparable injury to the nerve roots or cord which may result from mechanical or unavoidable surgical trauma as well as for relief of pain which arises from neuromas and after amputation of limbs.

The progress achieved in preparation of protein hydrolyzates for parenteral or oral use in management of certain critical surgical and medical conditions marked a milestone on the road of progress in nutrition. Nitrogen equilibrium can be maintained by parenteral administration of these hydrolyzates, without recourse to dietary nitrogen, provided enough carbohydrate is supplied. Alexander Brunschwig and his associates successfully supplied a patient with proteins by parenteral administration of a casein digest for eight weeks. Preparations of the essential amino acids are also available. These have been recommended for treatment of allergic states, chronic peptic ulcer, and the hypoproteinaemia which results from bleeding ulcer.

The treatment of chronic gastroduodenal ulcers by the intragastric continuous drip method, especially those refractory to the usual treatment, was increasingly regarded as most effective. From the standpoint of surgical treatment, subtotal gastrectomy in addition to anterior subphrenic section of the vagus nerve at the cardia, or complete supradiaphragmatic vagotomy

alone, as recommended by Lester R. Dragstedt, have been advocated.

**The Biliary Tract.**—Infectious hepatitis, so-called catarrhal jaundice, is a serious problem in the civil population throughout the world. It proved to be the only pandemic disease of World War II. Investigations showed that the causative agent is, in all probability, a virus and that the virus may be present in the faeces of persons who have the active disease. Infectious hepatitis can be produced readily in man by feeding infective faeces or infective serum and by spraying such material into the nasopharyngeal passages. The same purpose can be accomplished by injection of infected serum. J. R. Neefe and Joseph Stokes reported in detail an epidemic of infectious hepatitis, apparently due to a water-borne agent. Their observations on the efficacy of gamma globulin in the prevention and attenuation of disease have been confirmed by others. The investigations of M. Herbert Barker, Richard B. Capps and Fred W. Allen confirmed earlier convictions that chronic hepatitis, in an active and in an inactive form, is frequently a sequel to acute hepatitis.

**FILMS.**—*Alimentary Tract; Digestion of Foods* (Encyclopædia Britannica Films Inc.). (G. B. EN.)

**All-American Canal:** see AQUEDUCTS; IRRIGATION.

**Allergy.** During 1945 several authors emphasized the importance of nonprotein substances as causes of allergy. S. M. Feinberg and R. M. Watrous reported 14 cases of allergic rhinitis in employees of a pharmaceutical plant following exposure to chloramine-T and halazone. The importance of this report was the finding of positive skin and passive transfer reactions to these simple chemicals. In line with this study of chemical sensitivity was K. A. Baird's description of dermatitis in a baker due to benzoic acid used as an "improver" of flour, and of cobalt dermatitis among carbide workers described by L. Schwartz and his co-workers.

In contrast with these studies of external causes of allergy was the observation made by B. Zondek and Y. M. Bromberg of various allergic disturbances due to sensitivity of patients to their own hormones. These authors reported itching of the vulva, asthma, vasomotor rhinitis, urticaria and angioneurotic oedema related to menstrual or climacteric disturbances. Positive skin reactions were obtained with various steroid hormones in these patients. Complete or marked improvements occurred in a large proportion of the 44 cases treated by "desensitization" with the hormones.

The use of penicillin for the treatment of asthma due to respiratory infection resulted in a number of contradictory reports. A. L. Barach and his co-workers reported favourable results in infectious asthma from inhalation of finely vaporized (aerosol) penicillin. These results were confirmed by Herbert N. Vermilye. Contrary to these favourable findings were the observations of S. F. Hampton and his associates. They used

massive doses of penicillin by injection and by a pressure spray but were unable to find effective benefit in eight asthma patients. Improvement in methods of administration by improving the nebulizing apparatus was described by H. A. Abramson and M. Demerec. This may produce more consistent results in penicillin therapy by inhalation. Despite previous reports to the contrary it was shown that sensitivity to and allergic reactions from penicillin may occur. A. Rostenberg and H. Welch reported in a study of 144 normal persons who had never received penicillin that 5% gave positive skin reactions to the material. Some of the subjects developed sensitivity from repeated injections of penicillin. What the proportion would be in patients sensitive to moulds was not brought out by this report.

A significant contribution to the treatment of pollen asthma was made by M. B. Cohen and H. J. Friedman. Three patients were treated with ragweed pollen to which was added pollen antibody prepared by immunizing normal human beings. Only three to four injections were given each patient before the pollen season. Excellent results were reported in this limited number of patients.

The treatment of hives has always been a difficult problem in medicine. To the many measures already reported, J. H. Black added one more by using vitamin K. The patients selected had failed to respond to the usual allergic management. Of these, 62% were helped by vitamin K.

**Allied Commission on Reparations.** At the three-power conference at Yalta, U.S.S.R., Feb. 4-11, 1945, it was agreed by the United States, the United Kingdom and the soviet union that Germany, after its defeat, should be made to compensate the Allied nations for damages sustained as a result of the German aggression, such compensation to be made "in kind to the greatest extent possible." It was agreed to establish a commission in Moscow.

Accordingly, the Allied Commission on Reparations met in Moscow, June 21-July 14, 1945. Participants were: for the United States, Edwin W. Pauley, personal representative of the president, with Dr. Isador Lubin as associate; the United Kingdom, Sir Walter Monckton; and the soviet union, deputy commissar for foreign affairs, Ivan M. Maisky.

The commission reached informal agreement on a plan providing for: (1) maximum possible compensation "in kind" (that is, in materials, commodities and capital equipment as contrasted with payment in money) to the Allied nations on the basis of their respective contributions to, and losses sustained in, bringing about the defeat of nazi Germany; (2) elimination of Germany's war-making power, through removals of machinery and equipment; and (3) maintenance of sufficient means of livelihood within Germany to ensure that no other

nation need assume the burden of supporting the German people.

Under the plan, claims of the U.S.S.R. and Poland were to be met by removals from the zone of Germany under soviet occupation, and claims of other Allied nations were to be met by removals from the western zones occupied by the United States, the United Kingdom and France. The latter three nations in Aug. 1945 invited 15 other countries, members of the United Nations, to present their individual claims for reparations, with a view to conferring subsequently on the matter of a division of the German assets available for meeting these claims.

Also under the plan, the soviet union was to receive 15% of the industrial equipment deemed removable from the western zones of Germany in exchange for equivalent value of food and other commodities, and another 10% without any obligation in return.

Power of decision on specified removals from Germany was vested in the heads of the military governments in their respective zones.

The reparations plan was approved at the conference of President Truman, Prime Minister Attlee and Marshal Stalin in Potsdam, Germany. (E. W. Py.)

**Allied Control Council:** see ALLIED MILITARY GOVERNMENT.

**Allied Council for Japan:** see ALLIED MILITARY GOVERNMENT.

**Allied Military Government.** Spurred by Allied victories over Germany and Japan, Allied military government (A.M.G.) grew in 1945 until it had responsibility for the government of more than 200,000,000 people scattered from Korea to Germany.

The distinction between military government in enemy countries, and the administration of civil affairs in liberated United Nations was illustrated by the operations in Germany on the one hand, and France, Belgium, the Netherlands and Luxembourg on the other.

During the combat phase of operations, the prime objective of U.S. and British military government had been to assure Allied generals that their armies would not be impeded by civilian disorder and unrest while they were trying to defeat the aggressor nations. Closely associated with this objective was the great aid given liberated countries by civil affairs officers as axis armies were driven from their soil. In these countries civil affairs officers helped restore economic and political life until provisional governments could assume the responsibility.

With the end of combat, the key objective of military government became demilitarization and democratization of the defeated countries, executing policies and enforcing rules established by the U.S. government and its allies. In no instance did military government make political policy.

At the end of 1945 the first Allied commission established to administer a defeated country prepared to move from its original testing ground—Italy, where, only two and one-half years before, U.S. and British military government personnel had begun the job of replacing a 22-year-old fascist regime with democratic government.

In Italy a representative government was functioning. The wheels of economic and political life had begun to revolve once more. Also, 1945 saw civil affairs officers turn over a majority of their functions to provisional governments in France, Belgium, Netherlands and Luxembourg. Detachments came in with Allied armies in Normandy on D day and followed them in the victory drive across Europe. In these liberated countries they helped

AUXILIARY POLICE at Bayreuth, Germany, supervised by the Allied Military government in 1945. They lacked uniforms but bore arms to preserve peace and guard property. They had only a limited authority over Allied nationals, and none over Allied military personnel

restore communications, fed the population, obtained seed for planting, removed mines from the fields, started operation of mills and coal mines, procured labourers for the Allied armies and cared for millions of displaced persons.

In Germany, military government did not wait for V-E day and unconditional surrender to go into operation. It rolled up with and behind divisions, corps and armies, created local German governments; maintained civilian law and order; established centres of refuge for displaced persons; restored essential communications; ousted nazis from government and industry; assisted in bringing war criminals to trial; and put Germans to work on farms, roads and rubble-packed streets. Bombed-out water and sewerage systems were made to work again; epidemic diseases were prevented. Invaluable art treasures were recovered and given interim security by M.G. experts.

Following Germany's collapse, military government was set up by Great Britain, U.S., Russia and France throughout four zones. The military governor of the U.S. zone was also the U.S. member of the Allied Control council in Berlin which was working out a common occupation policy under directives of the Berlin conference.

The end of the year found denazification of the U.S. zone of Germany virtually complete. Almost 200,000 nazi office-holders were ousted and 100,000 more held in custody for trial. M.G. also made substantial progress in the job of demilitarizing Germany, demobilizing its army, razing war plants which the bombers missed, destroying war weapons and liquidating cartels.

Military government also began the arduous task of educating the Germans to democratic thoughts and ways, and elections were planned for early 1946.

The pattern of A.M.G. in Austria was virtually the same as in Germany, except that the country was classified as liberated and a representative government was quickly established. Four Austrian zones were occupied by U.S., British, Russian and French troops, and an Allied Control council was established. The commanding general of the U.S. occupation forces also served as U.S. representative on the council.

On the other side of the globe, other M.G. units were island-hopping with Allied naval units in Pacific ocean areas and with ground force units into liberated areas in the Southwest Pacific, the Philippines and Japan and Korea.

Unlike the situation in Germany, the supreme commander for the Allied powers in the Pacific was able to make use of an existing government in Japan, thus making the job primarily one of supervision to see that Allied orders were carried out. In Germany M.G. had to build from the ground—feeding, clothing,

housing, transporting and furnishing medical care to 6,500,000 displaced persons in the process.

The terms of the Potsdam declaration, the instrument of surrender and the directives of the joint chiefs of staff furnished the terms of reference for military control of Japan. These were implemented by a series of memoranda from the Allied supreme commander's headquarters.

In Japan, wage and price controls were established; the Japanese imperial general headquarters, the war and navy ministries, the Greater East Asia ministry, the Students Demobilization bureau, all ultra-nationalistic, secret and other societies which might have proved inimical to the fulfilment of the terms of surrender were abolished; and the Japanese government was instructed to refrain from sponsoring, perpetuating, or in any way participating in Shintoism.

Military schools were closed in Japan; objectionable teachers were removed and demobilized military personnel were barred from teaching until thoroughly investigated; and religious education was again permitted in private schools. Secret police organs, concerned with the control of thought, speech, religion and assembly, were abolished; the government was forbidden to abridge freedom of thought, religion, assembly and speech; unrestricted discussion of the emperor and government was allowed; and all persons confined on political grounds were ordered released.

By the end of 1945, the supreme commander for the Allied powers had virtually completed the demobilization of the Japanese army and navy; he ordered the arrest and trial of many high-ranking government officials, industrialists and businessmen as suspected war criminals; and had begun a far-reaching investigation of atrocities occurring in prisoner of war camps. By the end of the year, steps had been taken to liberalize voting to encourage wider participation in government. Free and open discussions on the future type of Japanese government were encouraged. Appropriate measures had been set in motion to educate the Japanese people in democracy and stamp out every vestige of militarism. Domei, the government monopoly news agency, was dissolved and two independent news agencies were established.

As a result of the conference of foreign ministers in Moscow in December, the Far Eastern Advisory commission was replaced by the Far Eastern commission, whose functions were: to formulate policies with respect to Japan; to review, on the

request of any member, any directive issued to the supreme commander for the Allied powers or any action taken by the latter involving policy decisions, and to consider such other matters as might be assigned to it by agreement among the participating governments.

The conference also established an Allied Council for Japan to be located in Tokyo. It was composed of four members representing the U.S., Russia, China and the United Kingdom. The Allied council was to consult with and advise the supreme commander for the Allied powers in regard to the implementation of the terms of surrender and directives issued supplementary thereto. The supreme commander for the Allied powers was the sole Allied executive authority in Japan. He was to withhold issuance of orders in the absence of unanimity of the council when those orders concerned: a change in the regime of control; fundamental changes in the Japanese constitutional structure; or a change in the Japanese government as a whole, pending agreement thereon in the Far Eastern commission.

The occupation and liberation of Korea necessitated the immediate assumption of control of all government functions and release of Japanese officials.

During the period from Aug. 15, when hostilities ceased, and Sept. 9, the day of liberation, approximately 65 political parties sprang up, because of a lack of unity of action, leadership and 35 years of oppression by the Japanese. With the return of former political leaders in exile, an attempt was made to unify all political parties and at the end of the year considerable progress was made with three major parties emerging; *i.e.*, the Democratic party, the People's republic and the People's party.

The separate occupation of Korea by the U.S. forces in the south and the Russian forces in the north created many difficult problems in the administration of the country's economy. This was because of the lack of any joint group authorized to assure common action on problems relating to the country as a whole. Steps to solve this problem were taken at the Big Three Conference of Foreign Ministers in Moscow, when it was decided to establish a joint Soviet-American commission formed from the two military commands in Korea, preparatory to formation of a provisional government under the supervision of the U.S., United Kingdom, Russia and China. (See also EUROPEAN ADVISORY COMMISSION.) (J. H. Hg.)

ONE OF 10 German schools for first to fourth graders, opened in Aachen, Germany, by the Allied Military government on June 4, 1945. Teachers and curricula were carefully screened for taint of nazi ideology. Lessons were in the three R's, gymnastics, natural history and religion

**Allocations and Allotments:** see PRIORITIES AND ALLOCATIONS.

**Alloys:** see BERYLLIUM; MAGNESIUM; METALLURGY; MOLYBDENUM; MONAZITE; NICKEL; TITANIUM; VANADIUM.

**Almonds:** see NUTS.

**Aluminum.** World production of aluminum, as estimated by the U.S. bureau of mines, is shown in Table I, supplemented by a few official figures.

Demands of World War II passed their peak in 1943, and world output dropped from 2,176,000 short tons to 1,922,000 tons in 1944. Japan and the soviet union were the only countries showing increased output. German supplies were reduced from lack of ability to do better, and not for lack of need for the metal. One of the outstanding features of the war years was the record made by the aluminum industry in the United States and Canada, where combined outputs increased by nearly sixfold between 1939 and 1943. In the latter year their output was nearly double the world total of 1939.

**United States.**—A brief cross section of the progress of the industry in the United States is given in Table II.

Total plant capacity was 1,167,000 tons, of which 55% was

WORKER buffing an aluminum cooking utensil in a California plant in 1945. The plant had reconverted from the manufacture of castings for aircraft plants to aluminum pots and skillets

in privately owned plants and 45% in government-owned plants. In Jan. 1944 production was at the rate of 1,017,000 tons annually, declining to 560,000 tons in December.

In March 1945 the long-drawn-out court action against the Aluminum Company of America resulted in a decision that the company was a monopoly in certain phases of its operations, but dissolution of the company was postponed pending the disposal of surplus plant capacity after the close of World War II, in the hope that the disposal could be arranged in such a way as to establish a competitive industry. (See also METALLURGY.)

**American Citizens Abroad.** Because United States consular representation, the source of the department of state's information on the number of U.S. citizens residing abroad, was not yet re-established in all parts of the world in 1945, the department was unable to compile the estimate for that year. (R. B. S.)

**American College of Life Underwriters:** *see* SOCIETIES AND ASSOCIATIONS.

**American College of Surgeons:** *see* SOCIETIES AND ASSOCIATIONS.

**American Dental Association.** During 1945, the American Dental Association intensified its study of dental socio-economic problems. It developed a plan to provide dental services to individuals in the low income groups and it established principles and standards for experimental voluntary prepayment dental programs. It promulgated a set of four principles which, in the opinion of the association, should be observed in the formulation of a dental health program for the people of the U.S. To implement the objectives set forth by these principles, it caused to be introduced in congress two bills, the first of which would provide funds, facilities and personnel for dental research through the United States public health service; the second would provide grants-in-aid to states for dental health educa-

tion and dental services, particularly for children.

The association was also instrumental in having a bill passed in congress to improve the status of the dental corps in the United States navy. It assisted the Veterans' administration in improving dental service for veterans. It was particularly active in its efforts to solve the problems of dentists in service and those returned to civilian practice. It issued two manuals on dentistry for men in service. One contained information on the location and distribution of dentists; the second contained information on dental education for those individuals in the armed forces who might wish to enter the profession.

It revised its list of accepted dental remedies and certified dental materials. It produced a sound motion picture film on the history of the association and increased its public educational activities.

Because of the war, the association held no meeting of its house of delegates in 1945. Consequently, the 1945 officers were to officiate during the year 1946. These were: president, Dr. Walter H. Scherer; president-elect, Dr. Sterling V. Mead; first vice-president, Dr. Herbert E. King; second vice-president, Dr. W. I. McNeil; third vice-president, Dr. E. M. Clifford; secretary, Dr. Harry B. Pinney; treasurer, Dr. Roscoe H. Voland. (L. W. M.)

**American Economic Association:** *see* SOCIETIES AND ASSOCIATIONS.

**American Federation of Labor.** As in previous war years, the American Federation of Labor during 1945 followed established precedents for wartime activity. At the same time, the federation persistently pressed for adequate advance postwar planning on the part of the government in order to avert widespread unemployment and attendant loss of purchasing power when the transition period should be at hand.

With the dramatic and sudden closing of the war, the executive council of the federation immediately announced a program of postwar steps which labour regarded as immediately necessary in order to effectuate a speedy and orderly reconversion. This program included provisions for the return of prewar rights and privileges which were voluntarily relinquished in the interest of the war effort, such as the restoration of free collective bargaining; end of wartime controls over labour and industry; increased wages, etc. In its official declaration made on the announcement of the termination of hostilities, the executive council of the American Federation of Labor said in part: "For its own part the American Federation of Labor believes that organized labor has an important contribution to make for the postwar recovery program. . . . America still has a vitally important job to do—to win the peace."

The federation's legislative program for the immediate future called for enactment of the Kilgore bill providing broader unemployment compensation provisions; the enactment of the Murray-Wagner Full Employment bill; a postwar housing bill creating millions of new jobs over a 10-year period; a law lifting minimum wage levels; and the Wagner-Murray-Dingell Social Security bill broadening coverage under the law and expanding its services.

In the international field, the American Federation of Labor was in full support of the International Labour organization as the world centre for labour. It consistently refused to participate in international conferences composed of delegates which included representatives of workers organizations which the federation did not consider representative of the wage earners. The federation reaffirmed its position that it is not a political organization: it does not seek to control the government nor to

have the government control trade unions—rather does it insist upon both economic and political freedom coupled with freedom of speech and press, freedom of assemblage and freedom of worship.

The American Federation of Labor entered the postwar period firm in its conviction that the future prosperity of the United States depends upon the success of its free economic system—a system of free enterprise and free association of workers, and release from wartime government controls.

The American Federation of Labor had a paid-up membership in July 1945, of 6,946,218. Its resident officers were William Green, president, and George Meany, secretary-treasurer, with headquarters in the American Federation of Labor building, Washington, D.C.

**American Legion.** An organization of U.S. veterans of both World Wars I and II. Originally chartered as a World War I veterans' organization by congress in 1919, it became a two-war organization Oct. 29, 1942, when President Roosevelt signed Public Act 767, making honourably discharged veterans of World War II eligible for membership.

The accomplishments of the American Legion in 1945 included: (1) liberalization of its original G.I. Bill of Rights for World War II veterans through amendments providing increased benefits and cutting away much of the administrative red tape which hampered the operations of the law; (2) vast expansion of its rehabilitation service machinery on the state levels as well as nationally to render every possible assistance to returning veterans, particularly the disabled; (3) formulating and recommending to the nation a sound and practical program for national security built around a specific plan of universal training and including scientific research, a world-wide military intelligence system, training of diplomats, a navy strong in bases, ships, guns and men, unification of command with the army, navy and air forces on an equal level, retention of all secrets of the atomic bomb, maintenance of a national guard of not less than 425,000 men plus officer personnel, a highly trained, mechanized and mobile small regular army, and preservation of the U.S. merchant marine as a vital arm of national defense; (4) drafting of maximum employment program calling for 55,000,000 postwar jobs including the creation of 7,000,000 new jobs in the fields of distribution, sales and service; (5) distribution of more than 1,300,000 Christmas gifts to hospitalized soldiers and sailors at home and abroad; (6) enrolment of an all-time high membership of 1,667,743 including more than 500,000 World War II veterans.

Other 1945 achievements included: (1) appropriation by the

MEN AND WOMEN VETERANS of World War II being sworn in as members of the American Legion on Nov. 19, 1945, during the 27th annual Legion convention, in Chicago

Indiana state legislature of \$2,500,000 for the construction in 1946 of three new national headquarters buildings in Indianapolis; (2) vigorous endorsement of the San Francisco United Nations charter and the world security organization; (3) great expansion of national child welfare emergency aid to needy children of World War II veterans; (4) drafting of plans for a great increase in 1946 of all youth-training activities, including Boys' state, Junior Baseball, National High school; (5) launching of a nation-wide postwar accident prevention campaign; (6) modernization of its publicity machinery through the creation of a new national division of public relations with press, radio and movie branches, offices in Indianapolis, Ind., Washington, D.C., New York city and Los Angeles, Calif., and establishment of a national weekly press clipsheet going to 20,000 daily, weekly, radio, labour and college publications; and (7) record sales of victory bonds.

All membership records were broken again during 1945. On Dec. 31, 1945, the American Legion had an all-time high enrolment of 1,667,743 in 13,165 posts. Its auxiliary set a new mark with 634,822 in 9,765 units.

The Sons of The American Legion rolled up 46,258 members in 3,488 squadrons.

The Forty and Eight mustered a new peak of 64,016 members in 750 voitures. The Eight and Forty got 10,132 enrolments in 294 salons.

At the annual convention in Chicago, Ill., John Stelle, former governor of Illinois, farmer, lawyer and businessman of McLeansboro, Ill., was elected national commander. (Jo. Sr.)

**American Library Association.** Established in 1876, the A.L.A. is the official organization in the United States and Canada of librari-

ans and others interested in the educational, social and cultural responsibilities of libraries. It is affiliated with more than 60 other library associations in the United States and other countries and works closely with many organizations concerned with education, recreation, research and public service. Its activities were carried on in 1945 by a headquarters staff of 87 persons and by approximately 80 committees and boards of more than 600 volunteer workers, all interested in various aspects or types of library services. Its program includes information and advisory services, personnel service, field work, annual and mid-winter conferences (discontinued during World War II) and the nonprofit publication of numerous professional books and pamphlets (100 publishing projects considered in 1944-45). It publishes also the following periodicals: *A.L.A. Bulletin*, *Book-list*, *College and Research Libraries*, *Hospital Book Guide* and *Subscription Books Bulletin*.

Ralph A. Ulveling, Public Library, Detroit, Mich., was president 1945-46. The headquarters in 1945 were at 520 North Michigan avenue, Chicago 11, with Carl H. Milam, executive secretary. During the year, the association purchased an historic Chicago mansion at 50 East Huron street, which was to become its headquarters as soon as remodelling was completed.

Located in the Library of Congress annex, Washington, D.C., was the A.L.A. International Relations office with Harry Miller Lydenberg, director. A library information bureau, financed from funds contributed by librarians and friends of libraries, and operated by the association was opened in Oct. 1945 at 1709 M. street, N.W., Washington 6, D.C. Paul Howard directed activities of this office which was established to keep the government informed of library needs and to inform librarians of government activities and regulations.

In 1944-45 the association's income (excluding cash balance of \$197,000 at the close of the fiscal year on Sept. 1, 1944) was about \$1,133,800. Approximately \$223,700 was derived from membership dues, sales of publications, advertising, subscriptions, etc., and was used primarily for membership and publication activities. Publications are sold practically at cost as this aspect of the association's activities are conducted not for profit but in the interest of library progress. Income from endowment funds was \$76,500; \$53,600 came from librarians for the establishment of the A.L.A. National Relations office in Washington; \$188,000 was in payment of group retirement annuity premiums; and \$592,000 came from outside sources in the form of grants or payments for 25 specific purposes. The association's endowment was approximately \$2,110,000.

The 24th annual Newbery medal, for the outstanding contribution to children's literature printed in the United States, was conferred on Robert Lawson for *Rabbit Hill*, and the 9th annual Caldecott medal, for the most distinguished picture book, on Elizabeth Orton Jones for the illustrations of Rachel Field's *Prayer for a Child*. Both medals were presented in New York city on June 9, 1945.

The annual citations for distinguished service as library trustees were presented to Montefiore M. Harris, president of the San Antonio (Texas) Public Library board, and Mrs. Albert W. Errett, president of the board of directors of the Public Library, Kewanee, Ill. A third citation was awarded posthumously to a former trustee of the North Carolina Library commission, Charles Wedbee, of Hartford, Conn.

In recognition of his "contribution to library efficiency and to every field where books and periodicals are used," Halsey W. Wilson, president of H. W. Wilson company, was elected an honorary member of the association by its council. From its founding, the A.L.A. had conferred honorary memberships on only 27 persons.

The first conferences scheduled after the war were the mid-

winter at Chicago, Dec. 27-30, 1945, and the annual at Buffalo, N. Y., June 17-22, 1946.

During the war years the A.L.A.'s program was directed without open meetings. In addition to special wartime activities, the A.L.A. continued plans for special types of library service for demobilized service persons and war workers, accelerated postwar plans for libraries, considered the needs and problems of postwar library personnel, maintained federal relations with Washington on all matters affecting libraries, and gave consideration to international relations and needs in the library field.

The year 1945 marked the 20th anniversary of the A.L.A. Library Extension board, formed for "organized effort toward the goal of adequate public library service within easy reach of everyone in the United States and Canada." In 1925 there were 43% of the population without libraries, compared with 26% in 1945. Most of these were in rural areas. The formulation of postwar standards and studies of existing conditions made during the year were expected to provide a foundation for accelerated action in eliminating the remaining 26%.

Increased progress was made during the year in legislation, appropriations, and establishment of large-unit libraries.

In order to co-ordinate the efforts of many groups interested in collecting gift books for restocking libraries in war areas of the Allied Nations, the American Book centre was established in June 1945 under the auspices of several national library associations. A campaign for gifts of printed materials was to be conducted early in 1946.

Special attention was given in 1945 by the A.L.A. Board of Education for Librarianship to the need of recruiting more personnel for the profession and more scholarships in the 34 accredited library schools; to the redirection of professional education in line with changing requirements for librarianship; to certification and accreditation; and to the needs of veterans for orientation or other special courses.

Organized as a binational association, the A.L.A. greatly increased its international activities during World War II. Before the war, hundreds of foreign students had visited U.S. libraries and studied in U.S. library schools. Hundreds of U.S. librarians had visited, studied, and attended library conferences abroad. Many library ideas had been exported and imported, to the mutual advantage of all.

War conditions made it imperative to expand international library activities along other lines, when the exchange of personnel became impossible except between the Americas. During 1945, valuable research materials were exchanged with China, through co-operative arrangements between universities according to plans developed by the American Library association. The association continued to purchase and store research materials for the rehabilitation of war-damaged libraries. Through correspondence and librarians on official visits, it was possible, particularly in 1945, to keep in close touch with the Library association (British).

The association's work in Latin America, Europe, China and other devastated war areas is financed out of special funds from government, foundations, or individual libraries. (M. O. P.)

**American Literature.** The end of World War II and the arrival of the atomic age found American literary production considerably more noteworthy for its quantity than its quality. The booming book market of the war period showed no signs of a decline with the coming of peace and while publishers continued to count their fat profits, writers of best-sellers of no very notable claim to distinction were made relatively rich by Hollywood's willingness to pay for movie rights what would have been a king's ransom in another literary epoch. Novels that attracted attention merely

because they seemed somewhat better than their nearest rivals brought as high as \$250,000 for cinema purposes, or more than the lifetime earnings of many distinguished novelists of less opulent times.

Commercial and financial tendencies were much easier to discern than literary trends. In fiction, especially, there seemed to be no major influences at work. Established novelists like Sinclair Lewis, whose *Cass Timberlane*, the story of a middle-aged man's marriage to a young woman, handled as crude satire on present-day holy wedlock; Upton Sinclair, who in *Dragon Harvest* continued in the same key the long tale of Lanny Budd; and John P. Marquand, whose *Repent in Haste*, was a short, competent novel on a current war theme, surprised no one with their offerings and added nothing to their reputations. A notable new talent for the short story made its appearance in Jessamyn West's *The Friendly Persuasion*, quietly charming stories of a Quaker family, but there were few new novelists who aroused the critics to loud hosannahs. *Beach Red* by Peter Bowman, a story in verse of a landing in the Pacific, had all the earmarks of a successful tour de force, while James Ramsey Ullman's *The White Tower* was an exciting adventure story of mountain climbing rather than the philosophical novel its author seemed to have had in mind. Thomas B. Costain's *The Black Rose* was old-style romantic melodrama of the *Anthony Adverse* school and Nancy Bruff's *The Manatee*, a novel of Nantucket whaling days, was as scorned by the reviewers as was Kathleen Winsor's 1944 sensation, *Forever Amber*, but seemed as the year ended to be on its way to a large popular success, aided by an all-out publicity campaign.

The spate of war books shrank notably as the world turned its attention to the problems of peace, but the public continued to be interested in Gen. George Marshall's work, *The Winning of the War in Europe and the Pacific*, which was really the biennial report of the chief of staff of the United States army from July 1, 1943 to June 30, 1945. Another factual report was widely read because of its timely nature, *Atomic Energy for Military Purposes*, by Henry de Wolf Smyth, which was issued under the direction of Maj. Gen. L. R. Groves, head of the atom bomb project. Other books on the atom included *Atomic Energy in the Coming Era* by David Dietz and *Almighty Atom* by John J. O'Neill, both by popularizers of science; and also a quickly produced addition to Pocket Books, *The Atomic Age Opens*, which was edited by Donald Geddes and Gerald Wendt, a piece of semi-journalistic enterprise that proved popular. On the closely allied subject of jet propulsion and rocket power, there were three valuable books, R. Tom Sawyer's *The Modern Gas Turbine*, Herbert S. Zim's *Rockets and Jets* and G. Edward Pendray's *The Coming Age of Rocket Power*.

Among the books that appeared generally on lists of the best offerings were included such explorations into the U.S. past as George F. Willson's lively *Saints and Strangers*, a fresh approach to the history of the pilgrim fathers and Plymouth plantation; Arthur M. Schlesinger, Jr.'s *The Age of Jackson*, a re-interpretation of Jacksonian democracy in the light of a large body of hitherto undisclosed facts, which won the immediate praises of young Schlesinger's fellow historians; and Henry Christman's *Tin Horns and Calico*, a stirring account of a revolt of tenant farmers against the patroons of the Hudson valley, which had an introduction by Carl Carmer. Louis Bromfield's *Pleasant Valley* sang the praises of a farmer's life and gave a glowing account of how successfully Bromfield had combined art and agriculture on Malabar farm in the author's native Ohio.

In biography one of the most solid contributions was J. G. Randall's *Lincoln the President: Springfield to Gettysburg*, a two-volume work by a historian who examined and weighed all

the factual evidence available and thereby added much to the better portraits already in existence. Another book about Lincoln was Jay Monaghan's *Diplomat in Carpet Slippers*, which described the handling of foreign affairs by the president and revealed another side of his shrewdness. Thomas Paine found a passionate defender in W. E. Woodward, whose *Tom Paine: America's Godfather* moved a national hero another step toward complete rehabilitation. Claude G. Bowers added a fine volume to his full-length study of Jefferson in *The Young Jefferson, 1743-1789*, which told the story from Jefferson's boyhood in colonial Virginia down to his return from France to become a member of Washington's cabinet.

In *Names on the Land* George R. Stewart examined with affection and thoroughness place-naming in the U.S. and proved it to be a fascinating subject. Norman Corwin's radio dramas *On a Note of Triumph* brought an interesting new form of literary expression, which he had obviously mastered, to public attention. Norman Cousins expanded a *Saturday Review of Literature* editorial into a small book, *Modern Man Is Obsolete*, which declared with no qualifying words that in view of the existence of the atom bomb the human race must either form a world government or perish. Cousins presented his case cogently and forcefully, but left others to work out the details of the operation. Emery Reves also argued for a world state in *The Anatomy of Peace* and found the idea of national sovereignty dangerously obsolescent.

Secretary of commerce Henry A. Wallace's *Sixty Million Jobs* tackled the problem of universal employment under capitalism and William Aylott Orton's *The Liberal Tradition* offered the opinion that liberalism as a philosophy was decadent because it had lost its spiritual content. Charles G. Bolté's *The New Veteran* came boldly to grips with the question of the returning serviceman's place in a democracy; Jacques Barzun, French-born but for a long time a U.S. professor, attracted wide attention with his refreshing book on education, *Teacher in America*; and Henry L. Mencken continued his priceless investigation into our ways of speech with Supplement One of *The American Language*, a supplement as large as the fourth edition of the parent volume, and also every bit as rich.

The nation chuckled over Betty MacDonald's *The Egg and I*, a light-hearted book about the adventures of poultry raising by city people who purchased a "little place in the country," and a most popular book was a collection of cartoons by Bill Mauldin called *Up Front*, which portrayed G.I.-Joe as a democratic soldier who fought much better than he dressed or looked. Two books, *One Nation*, a collection of photographs, with text by Wallace Stegner, and *A Nation of Nations* by Louis Adamic dealt with the diverse strains in U.S. culture; Stegner's emphasis being upon the abuses of minorities, and Adamic's upon the vast contributions made by peoples not of the Anglo-Saxon strain. Charles P. Curtis, Jr., and Ferris Greenslet collected "man's thinking about man" into *The Practical Cogitator*, an unusual anthology that had a certain timeliness in view of the widespread discussion of the possible wiping out of the human race in an atomic war. A publishing event of considerable importance was the completion of the 12-volume *History of American Life*, edited by Arthur M. Schlesinger and Dixon Ryan Fox, with Carl Becker as consulting editor. Dr. Fox, who died during the year, was co-author with John Allen Krout of the volume which finished the set, Number Five, *The Completion of Independence, 1790-1830*.

**War and Peace.**—Among the best of the war books were Ira Wolfert's *American Guerrilla in the Philippines*, a record of daring individual heroism to match anything in its field and *Persian Gulf Command* by Joel Sayre, an excellent piece of reporting on Americans at work in Iran, which remained timely

IN THE CLOSING ISSUE of *Yank*, the Army Weekly, Dec. 28, 1945, the Sad Sack, Sgt. George Baker's army private cartoon character, continued his luckless way. "Happy Day" showed him no less confused by civilian life than he was as a soldier

throughout the year because of the international situation in the area discussed. Keith Wheeler, a correspondent who was himself seriously wounded, spoke for the living victims of warfare in *We Are the Wounded*, a book filled with praise for the courage of the injured; and the story of the coast guard in World War II was told in *Sea, Surf and Hell*, edited by Commander Arch R. Mercy, U.S.C.G.R., and Lee Grove of the same branch of the service.

Two books on the carrier type of warfare, one of the most important developments in World War II, were *Carrier War* by Lt. Oliver Jensen, U.S.N.R., which told the story of task force 58 and its achievements, and *Mission Beyond Darkness* by Lt. J. Bryan III, U.S.N.R. and Philip Reed, written from the airman's point of view. *Old Leatherface of the Flying Tigers* by Keith Ayling was the story of Brig. Gen. Claire Chennault and the exploits of his daring aviators. *Betio Beachhead* was the marines' own story of Tarawa, written by Capt. Earl J. Wilson and marine correspondents Jim G. Lucas, Samuel Shaffer and C. Peter Zurlinden. *The Best from Yank* was a collection of a great variety of contributions in the soldiers' magazine, which passed out of existence at the close of 1945.

Problems of the peace were considered in a large number of books, such as Ralph Barton Perry's *One World in the Making*; Nathaniel Peffer's *America's Place in the World*, another argument for making international government as strong as possible; William Henry Chamberlin's *America: Partner in World Rule*, which predicted war with Russia; and *The Basis of Lasting Peace* by Herbert Hoover and Hugh Gibson. George Soule touched upon an important topic in *America's Stake in Britain's Future*, in which he argued the interdependence of the economic systems of the two nations; while David J. Dallin in *The Big Three* expressed pessimism about the ability of the United Nations organization to solve problems being handled, in his opinion, solely on the basis of power politics. Two books on Wilson—

*Woodrow Wilson and the Great Betrayal* by Thomas A. Bailey and *Woodrow Wilson and the People* by H. F. C. Bell—pointed out similarities between the post World War II and the post World War I periods.

Of books on the problems of separate countries, Henry Morgenthau Jr.'s *Germany is Our Problem* seemed to be alone in its field, while Japan especially and the far east generally received a great deal of attention in such well informed discussions as Owen Lattimore's *Solution in Asia*, which recommended the most complete co-operation possible, especially with Russia; Philip Jaffe's *New Frontiers in Asia*, a full, well-done survey of the whole contemporary situation; Wilfrid Fleisher's *What to do With Japan*, which argued that the Japanese must be shown they were really beaten; Lt. Andrew Roth's *Dilemma in Japan*, which urged the need to give strong backing to the existing democratic elements in Japan; Willard Price's *Japan and the Son of Heaven*, which insisted that we must get rid of the emperor for good; and *Shinto: The Unconquered Enemy* by Robert O. Ballou, a plea for the complete destruction of Japan's state religion. Timely books on China included Gunther Stein's *The Challenge of Red China*, a penetrating study of the communists in action; and Harrison Forman's *Report from Red China*, another fair and useful study.

Efforts to clear up the mystery of the U.S.S.R. continued. Edmund Stevens insisted that *Russia Is No Riddle*, declaring that the Russians were simply being kept uneasy by the imperialistic foreign policy of capitalistic states. Richard E. Lauterbach's *These are the Russians* was a reasonable explanation of what the Russians are really like, the thesis being that the soviet system had saved the country from Hitler, but that it was decidedly not for the U.S. Edgar Snow's *The Pattern of Soviet Power* gave a clear analysis of existing conditions and of international attitudes. W. L. White's *Report on the Russians* presented a decidedly unfavorable picture of actual conditions within the soviet union and was believed or violently attacked according to the political leanings of the reviewers. One of the best informed of living foreign observers and correspondents, Paul Scott Mowrer, produced an autobiographical volume called *The House of Europe*, in which he urged a broader and more definite foreign policy as one of the essentials of the United States' proper part in the world drama.

**The United States.**—The work of covering the United States river by river, mountain by mountain and region by region which was begun about 1935 plowed steadily ahead with the appearance in the Rivers of America series of *The Missouri* by Stanley Vestal, *The Salinas, Upside-down River* by Anne B. Fisher and *The Shenandoah* by Julia Davis, while Blair Niles revised and enlarged her *The James: From the Iron Gate to the Sea*. The Great Lakes series was completed with *Lake Erie* by Harlan Hatcher, while Wallace W. Atwood told of *The Rocky Mountains* in a new series and Robert Ormond Case and Victoria Case wrote of *Last Mountains: The Story of the Cascades*, using many handsome photographs to help tell their absorbing story.

Struthers Burt's *Philadelphia, Holy Experiment* was a notable addition to a series about U.S. cities and Gertrude Atherton told San Francisco's story in *Golden Gate Country*, while Margaret Parton covered the same

subject from another angle in her autobiographical *Laughter on the Hill*, youth and Bohemia as seen from a shack on Telegraph hill. The west was also treated in James Gray's *Pine, Stream and Prairie*, a book about Wisconsin and Minnesota by a noted novelist and book reviewer of the region; in Meridel Le Sueur's *North Star Country*, which covered Minnesota, Wisconsin, the Dakotas and Michigan's upper peninsula and did it brilliantly; in *If the Prospect Pleases: the West the Guidebooks Never Mention* by Ladd Haystead; in *Texas; An Informal Biography* by Owen P. White, who is one of the more passionate admirers of his home state; and *This is the Place* by Maurine Whipple, which covers Utah, with pictures.

A hitherto neglected region received attention in *Nine-Mile Bridge* by Helen Hamlin, who spent three years in Maine's fabulous Aroostook county amid its French puritans and loggers and who broke fresh ground with her descriptions of the country and its people. Samuel Chamberlain's picture-book, *Ever New England*, with an introduction by Donald Moffat, gave a comprehensive view of a section that cannot be exhausted in its interest; and at the other end of the country, Harnett T. Kane continued his rewarding exploration of the deep south in *Plantation Parade*, a book about the great houses of the "good old days" and the odd people who lived in them. Lyle Saxon's work as historian of New Orleans and vicinity received an excellent addition to *Gumbo Ya-Ya*, a collection of folk material edited by Saxon and some of his friends, which revealed anew the richness of the U.S. in the raw material of literature and art.

Alaska continued to receive considerable attention. George Sundborg's *Opportunity in Alaska*, a soberly factual account filled with sound information; *Alaska: Promyshlennik and Sourdough* by Stuart Ramsay Tompkins, a history and also an account of present possibilities; and Henry Varnum Poor's *An Artist Sees Alaska* were notable additions. Poor went to Alaska to paint and remained to put into words his impressions, illustrating them himself.

Other books that told much of U.S. history from various angles included two on the industry of sheep raising, which began when Columbus introduced the valuable animals into the new world, *Shepherd's Empire* by Charles Wayland Towne and Edward Norris Wentworth, and *The Golden Hoof* by Winifred Kupper; *Railroad Avenue: Great Stories of American Railroad* by Freeman H. Hubbard; and *Big Business in a Democracy* by James Truslow Adams, in which large corporations were praised and capitalism presented in its brighter aspect.

Current problems more or less peculiar to the United States were dealt with in Ward Shepard's *Food or Famine: The Challenge of Erosion*; Frank Lloyd Wright's *When Democracy Builds*, in which a noted modernistic architect described his plans for the ideal cities of "Usonia" and "Broad-acres"; Dorothy Rosenman's *A Million Homes a Year*, or how to deal with the housing problem by building plenty of low-cost houses with government aid; *Black Metropolis*, a study of Negro life in a northern city by St. Clair Drake and Horace R. Cayton, with an introduction by the novelist Richard Wright and *They Seek a City* by Arna Bontemps and Jack Conroy, a study of Negroes on the move, which argued that the race problem was now common to all parts of the U.S.; and *America's Role in the World Economy* by Alvin H. Hansen, which insisted that the U.S. must maintain its own prosperity in order to assist the rest of the world to be prosperous.

**Regionalistic Anthologies.**—Four large volumes undertook to bring together on a regionalistic basis the best writing available, or at least representative selections. The most ambitious of these was *North, South, East, West*, edited by Charles Lee, with the help of five associates, and containing a good selection. The other three were *Promised Land*, a collection of northwestern writing edited by Stewart Holbrook; *America is West*, an anthology of midwestern life and literature, edited by John T. Flanagan; and *Mid Country*, edited by Lowry C. Wimberly, with an introduction by B. A. Botkin.

**Biography and Criticism.**—Among the widely read biographies were Samuel Hopkins Adams' *Alexander Woolcott: His Life and His World*, a candid portrait of a curious literary figure of these times; Kenneth S. Davis' *Dwight Eisenhower: Soldier of Democracy*, not the first life story of the chief of staff of the U.S. army, but by far the most thorough and of especial value as a study of a typical American; Fawn M. Brodie's *No Man Knows My History*, the life of Joseph Smith, the Mormon prophet, which is at once the first definitive biography of an interesting personality and a dependable history of the early days of the Mormons and their church; Edgcomb Pinchon's *Dan Sickles: Hero of Gettysburg and "Yankee King of Spain"*, a portrait of one of the most fantastic characters in U.S. history, who lived to be 95 and counted a love affair with a queen of Spain as only one of his innumerable amorous adventures; and *Enrico Caruso: His Life and Death*, by Dorothy Caruso, a wife's tribute to her artist husband, which portrayed a man of great natural talent who worked very hard to gain and keep his place as an opera singer.

There were two biographies of notable public figures, *Al Smith, American* by Frank Graham, and David Hinshaw's *A Man from Kansas*, the story of William Allen White, both worthy of their subjects. Joseph Cannon Bailey paid tribute to a great leader in agriculture with his *Seaman A. Knapp: Schoolmaster of American Agriculture* and a quick sketch of a living president was done by Frank McNaughton and Walker Hehmyer in *This Man Truman*. American scholars proved their cosmopolitan interests with such books as Robert Haven Schaffer's *Florestan*, a biography of Robert Schumann; Frances Winwar's *The Life of the Heart: George Sand and Her Times*; Katherine Anthony's *The Lambs*, a study of Charles and Mary and their odd relationship; and *The Trollopes: The Chronicle of a Writing Family*, by Lucy Poate Stebbins and Richard Poate Stebbins, a mother-son writing combination.

Of autobiographies there were a number that attracted deserved attention, one of these being Marquis James' *The Cherokee Strip*, a story of a typical American boyhood, admirably told by the biographer of Andrew Jackson. Another was *Fighting Liberal* by the late Senator George W. Norris, who died at 83 without ever having hauled down his flag; and the list also included Oliver La Farge's *Raw Material*, the story of the inner life of the author of the well-known Indian novel, *Laughing Boy*; *That Vanishing Eden: A Naturalist's Florida* by Thomas Barbour,

a book about Florida past and present written by a great naturalist who expressed the fervent desire that Florida might become a homeland for people desiring to lead normal lives; *All Our Lives, Alice Duer Miller*, the candid story of the marriage of two writers, written by H. W. Miller, the survivor of the couple, and with great charm; and Benjamin Franklin's *Autobiographical Writings*, edited by Carl Van Doren, and one of the most important volumes of Frankliniana to appear in a number of years.

In *A Texan in England* J. Frank Dobie, professor of English at the University of Texas, wrote a small romantic volume describing his happy experiences as a visiting professor at Cambridge, England, which he liked very much indeed. Morris Ernst told of his adventurous career as a liberal attorney in *The Best is Yet* and Charlie May Simon described life in the Ozarks under the title of *Straw in the Sun*, the account of three years among southern mountaineers; while George Santayana continued his autobiography with *The Middle Span*, which covered the period between 1889 and the end of the Harvard era, and which seemed inferior to the first volume of *Persons and Places*. Richard Wright's *Black Boy*, a bitter small book on how a Negro boy grew up in the U.S., was rated by many critics as among the year's best.

In criticism, the interest in Henry James which began to manifest itself in 1944 continued with the publication of *The Short Stories of Henry James*, edited with copious comment by Clifton Fadiman, and of a new edition of *The Bostonians* with an introduction by Philip Rahv. *The Question of Henry James*, edited by F. W. Dupee, contained 26 articles on James and his works. Edmund Wilson collected and edited the literary remains of F. Scott Fitzgerald in *The Crack-Up* and helped to revive interest in the work of this talented novelist and short-story writer. George F. Whicher wrote a short but penetrating study called *Walden Revisited*, a centennial tribute to Henry David Thoreau and William Ellery Sedgwick's *Herman Melville: The Tragedy of a Mind* made a real contribution to the understanding of the author of *Moby Dick*. Alice Payne Hackett's *Fifty Years of Best-Sellers* was a complete record of a half century of changing tastes in fiction.

**The Novel.**—In addition to a selection of the notable novels presented earlier, other popular works of fiction included Glenway Wescott's *Apartment in Athens*, a story of the German occupation of Greece which divided the reviewers in their opinions; Josephine Pinckney's tale of social conflict in Charleston, S.C., *Three O'Clock Dinner*, well-done but brittle; Elizabeth Janeway's *Daisy Kenyon*, a second novel by the author of *The Walsh Sisters*, and a triangle involving a woman and two men, with the background our own times and very skillfully handled; William Maxwell's *The Folded Leaf*, the delicately done but slight story of the attachment between two boys, one an introvert, the other an extrovert; Anne Parrish's *Poor Child*, which showed a noteworthy growth of an exceptional talent; and Alice Tisdale Hobart's novel of modern Mexico, *The Peacock Sheds His Tail*, which was a competent handling of a thesis-plot that undertook to put into fictional form the social conflicts of the times. The most notable first novel was Adria Locke Langley's *A Lion is in the Streets*, the story of a character very much like the late Huey Long of Louisiana, and a work of fiction highly praised in all quarters was Josephina Niggli's *Mexican Village*, a collection of sketches that fused into what was called one of the best of recent books about Mexico and its people, as well as a distinguished piece of writing.

John Steinbeck's *Cannery Row* belonged to his lighter and more whimsical tradition and was not regarded as affecting his reputation one way or the other; Walter Van Tilburg Clark's *The City of Trembling Leaves* was a long and diffuse story of a young musician's growth that did not somehow come off, although Clark's talent is undeniable; Wilbur Daniel Steele's *That Girl from Memphis* was a successful period piece by a master of the short story who came closer to writing a good novel than in any previous attempt; David Cornel de Jong's *Somewhat Angels* was a satirical tale of three women who busied themselves keeping the home fires burning for absent servicemen; and in *Gold in the Streets* Mary Vardoulakis told the story of a Greek family living in Chicopee, Mass., in a novel which won an intercollegiate prize.

Other novels by writers of established reputations, none of them considered as representing the peaks of their authors' achievements, included Booth Tarkington's portrait of a predatory female, *Image of Josephine*; Pearl S. Buck's story of a successful marriage between a

A CORPORAL in the Fourth Marine division on Iwo Jima relaxes temporarily over Mr. Tutt Finds a Way by Arthur Train, published by Scribner's in 1945

cultured painter and a physically attractive country girl, *Portrait of Marriage*, which again proved that Mrs. Buck's talents are more at home among the Chinese than among contemporary Americans; Frances Parkinson Keyes' *River Road*, a long novel of life on a Louisiana sugar plantation; Charles Jackson's *Lost Week-End*, the powerful story of a drunkard; and Frederic Prokosch's *Age of Thunder*, a story of the war and its consequences considerably inferior to Prokosch's other novels. Ben Lucien Burman, novelist of the Mississippi river, moved one of his whimsical characters and a steamboat all the way to Africa in *Rooster Crows for Day* and wrote a sentimental story that pleased many people; James Street turned from colourful historical fiction to the life story of a small-town preacher in *The Gauntlet*, one of his best pieces of work to date; Susan Glaspell in *Judd Rankin's Daughter* wrote about good, everyday middle western people in a competent fashion; and Josephine Lawrence continued her series of problem-novels, which have all been faithful pictures of life in the United States, with *Let Us Consider One Another*, based on the marriage of a Jew and a Gentile.

Martha Dodd used her memories of nazi Germany as material for her novel, *Sowing the Wind*, which showed how the nightmare grew until it enveloped the world. There were two novels on racial themes of some merit, Chester B. Himes' story of a resentful Negro, *If He Hollers Let Him Go* and Edwin Peeples' *Swing Low*, a sympathetic account of life among the residents of Billiard hollow, a slum district of Atlanta, Ga. Other noteworthy collections of short stories, in addition to Jessamyn West's volume mentioned earlier, were John O'Hara's *Pipe Night*, William March's *Trial Balance and Other Stories* and Caroline Gordon's *The Forest of the South*.

**Latin-America.**—Interest in hemispheric neighbours continued, with especial emphasis on Argentina because of the political situation, and on Brazil because of the ever-increasing realization of the importance and possibilities of that great country. *The Argentine Republic* by Ysabel F. Rennie, complete and balanced, was written after two years of residence in the country. *Argentine Riddle* by Felix J. Weil was the work of an Argentine that threw much light on a complex problem. A translation of Ricardo Rojas' life of Argentina's national hero, *San Martin: Knight of the Andes*, made by Herschel Brickell and Carlos J. Videla, introduced a classic of contemporary Latin-American literature to the reading public of the United States, and *The Knights of the Cape*, selections from Ricardo Palma's long famous *Tradiciones Peruanas*, was done into English by Harriet de Onis.

Henry Albert Phillips wrote on both Argentina and Brazil, his two books being *Argentina: Pivot of Pan-American Peace* and *Brazil: Bulwark of Inter-American Relations*. *Brazil: Giant to the South* by Alice Rogers Hager, was illustrated with a number of magnificent photographs taken by Jackie Martin; Gilberto Freyre's *Brazil: an Interpretation*, a collection of essays by Brazil's leading sociologist, was a useful and informative short study; and Morris L. Cooke's *Brazil in the Making* was another solid contribution. *What the South Americans Think of Us*, a symposium, contained sections on Argentina by Samuel Guy Inman and on Brazil by Bryce Oliver, along with others on other countries by Carleton Beals and Herschel Brickell. An attempt to measure the present state of the Latin-American mind, the volume had the advantage of presenting points of view of writers who had actually lived in the countries discussed.

Of general books on Latin America, the most valuable was Roland Hall's *South America Uncensored*, made up of a series of articles first published in the *Christian Science Monitor*. Others in this category were *The Economic Problems of Latin America*, a comprehensive symposium edited by Seymour E. Harris and *The Pan American Year Book, 1945*, a reference book, with 53 maps. Charles Morrow Wilson's *New Crops for the New World* discussed the future place of the tropical regions as a source of food supplies for the world.

**Poetry.**—The year's record in original verse was undistinguished, although it saw a volume by Robert Frost called *A Masque of Reason*, a satirical poem based on Job, which revealed no new facet of its distinguished author's talent. Karl Shapiro, in the armed forces, wrote a long discussion of the present state of poetry called *Essay on Rime* that provoked discussion beyond its merits as literature, and the work of Alfred Kreymborg and John Crowe Ransom found representation in their *Selected Poems*, while David Morton's *Poems 1920-1945* presented a quarter century of verse of uniformly high quality. Individual volumes of merit included Gwendolyn Brooks' *A Street in Bronzeville*, a brilliant collection of verse by a gifted Negro poet; Randall Jarrell's *Little Friend, Little Friend*; and William Carlos Williams' *The Wedge*. Jeremy Ingalls' *Tahl* told the story of the life and death of a young aviator composer in a new kind of epic. Emily Dickinson's life and works were widely discussed in the light of the publication of *Bolts of Melody*, newly published poems which were fragmentary and decidedly inferior for the most part, and *Ancestor's Brocades: The Literary Debut of Emily Dickinson*, by Millicent Todd Bingham, which added a good many interesting details to the inexhaustible subject of the strange genius of the "New England nun." (See also ENGLISH LITERATURE.) (H. BL.)

**American Medical Association.** The American Medical Association included in 1945 almost 126,000 physicians in its membership who were themselves members of county and state medical societies. The association is a democratic organization whose policies are determined by its house of delegates. The house of delegates includes delegates elected by the houses of delegates of the individual state societies.

In 1945 the association had assets of property and equipment representing about \$1,500,000; securities of about \$4,600,000 and other assets making a total of almost \$7,000,000. Total

income for the year 1944 was more than \$1,500,000. The association is incorporated not for profit, and all funds are devoted to promoting its objectives, which, according to its constitution, are to promote the science and art of medicine and the betterment of public health. The publications of the American Medical Association include the *Journal of the American Medical Association*, with a circulation of 110,000 weekly; *Hygeia*, a health magazine for the public, with a circulation of approximately 200,000 monthly; a medical journal in each of the medical specialties; a directory which includes information regarding physicians, medical schools, libraries and hospitals, and the *Quarterly Cumulative Index Medicus*, which indexes regularly the contents of more than 1,200 medical periodicals.

Through its bureau of health education the association circulates hundreds of thousands of pamphlets devoted to education of the public in health, provides a radio program on health over a national chain and circulates thousands of radio transcriptions for use on local radio stations. The library of the American Medical Association conducts a package library service which sends articles and reprints to physicians on subjects of interest. Particularly requested by physicians in 1945 were articles on the Rh factor, penicillin, military medicine (including various phases of tropical medicine, aviation medicine, burns and malaria), blood pressure, the sulfonamides, anaesthesia and blood transfusion.

A special committee on postwar medical service developed plans to aid the graduate education of physicians returning from the war; a bureau of information aided medical veterans in finding new locations and helped to provide physicians for areas without medical personnel.

The association conducts its own printing establishment and in its headquarters offices at 535 North Dearborn street, Chicago 10, Ill., normally employs some 600 persons.

The meeting of the house of delegates of the association, held in Dec. 1945, adopted a program for the extension of medical services to the people and set up the following program of objectives:

1. Sustained production leading to better living conditions with improved housing, nutrition and sanitation which are fundamental to good health; supporting progressive action toward achieving these objectives.
2. An extended program of disease prevention with the development or extension of organizations for public health service so that every part of the United States would have such service, as rapidly as adequate personnel could be trained.
3. Increased hospitalization insurance on a voluntary basis.
4. The development in or extension to all localities of voluntary sickness insurance plans and provision for the extension of these plans to the needy under the principles already established by the American Medical Association.
5. The provision of hospitalization and medical care to the indigent by local authorities under voluntary hospital and sickness insurance plans.
6. A survey of each state by qualified individuals and agencies to establish the need for additional medical care.
7. Federal aid to states where definite need is demonstrated, to be administered by the proper local agencies of the states involved with the help and advice of the medical profession.
8. Extension of information on these plans to all the people with recognition that such voluntary programs need not involve increased taxation.
9. A continuous survey of all voluntary plans for hospitalization and illness to determine their adequacy in meeting needs and maintaining continuous improvement in quality of medical service.
10. Discharge of physicians from the armed services as rapidly as is consistent with the war effort in order to facilitate redistribution and relocation of physicians in areas needing physicians.
11. Increased availability of medical education to young men and women to provide a greater number of physicians for rural areas.
12. Postponement of consideration of revolutionary changes while 60,000 medical men are in the service voluntarily and while 12,000,000 men and women are in uniform to preserve the American democratic system of government.
13. Adoption of federal legislation to provide for adjustments in draft regulation which would permit students to prepare for and continue the study of medicine.
14. Study of postwar medical personnel requirements with special reference to the needs of the veterans' hospitals, the regular army, navy and United States public health service.

Resolutions were adopted to co-ordinate through the Council

on Medical Service and Public Relations of the American Medical association the various plans for voluntary sickness insurance and voluntary hospitalization insurance which were developing in the United States. The house of delegates opposed the plans for compulsory sickness insurance proposed by Senators Wagner and Murray and Congressman Dingell and included by President Harry S. Truman in his message on the health of the nation. The house of delegates favoured, however, the proposals for the extension of construction of hospitals and health centres throughout the U.S., the extension of preventive medicine under the Social Security act, a wider development of public health facilities, the establishment of a national science foundation to encourage co-ordinated and intensified research in the medical sciences and insurance against loss of wages due to illness.

The principal officers of the association, following the elections by the house of delegates in 1945, were: president, Roger I. Lee, Boston; president-elect, Harrison H. Shoulders, Nashville; secretary and general manager, Olin West, Chicago; treasurer, J. J. Moore, Chicago; editor of publications, Morris Fishbein, Chicago; business manager, Thomas R. Gardiner, Chicago. The board of trustees included: James R. Miller, Hartford, Conn.; John H. Fitzgibbon, Portland, Ore.; E. L. Henderson, Louisville, Ky.; Louis H. Bauer, Hempstead, N.Y.; William F. Braasch, Rochester, Minn.; Ernest E. Irons, Chicago; R. L. Sensenich, South Bend, Ind.; Dwight H. Murray, Napa, Calif.; Charles W. Roberts, Atlanta, Ga. (M. Fl.)

## American Veterans of World War II (Amvets).

Founded in Kansas City, Mo., Dec. 10, 1944, by ten independent veterans organizations from the states of Louisiana, Tennessee, New York, Texas, California, Florida, Washington, D.C., and Oklahoma, this national veterans organization was established exclusively for veterans of World War II.

Membership is restricted to U.S. citizens who are members of or who have served honourably in the army, navy, marine corps or coast guard of the United States, or its Allies, between Sept. 16, 1940, and date of cessation of hostilities, as established by the United States government.

The American Veterans of World War II makes no distinction between rank, sex, race or colour in its membership. Its purposes are to assist the veteran in all ways consistent with the public welfare; to restore in both veterans and all the people of the U.S. renewed faith and confidence in themselves and in their country, and recognition of the necessity and worth of individual and national integrity; to demand that public office be accepted and administered as a public stewardship and trust; to have a powerful voice in the peace and its preservation; to demand that U.S. leadership co-operate with the leaders of all nations who accept world peace as a national policy to the end that war shall not come to the world again; to avoid becoming another "pressure group" for veterans, at the expense of the public good and welfare; to assure the disabled veteran of all necessary assistance in his care and rehabilitation; and to serve the community and nation in peace as in war.

The first annual convention was held in Chicago, Ill., Oct. 12-

14, 1945, at which Jack W. Hardy of Los Angeles, Calif., was elected national commander.

The next convention of American Veterans of World War II was scheduled to be held in St. Louis, Mo., Nov. 21-24, 1946.

Membership (Dec. 1945): More than 200 local posts in 40 states; and in excess of 25,000 members. (J. W. Hy.)

**Amvets:** see AMERICAN VETERANS OF WORLD WAR II.

**Anaemia.** Numerous new studies were made on sickle cell anaemia. The abdominal crises were associated with packing of the small capillaries, stagnation, haemolysis and anoxaemia. The cholelithiasis rate was higher than in the normal population.

In Central America sicklaemia appeared in 9.6% of the individuals examined in the Canal Zone; in 9.6% among the British West Indians and in 11.2% of the Panamans.

The increase in the haematocrit reading above 20 mm. per hour following treatment of sickle cell anaemic blood with carbon dioxide was of diagnostic value (normal blood, less than 20 mm.).

A new type of severe hereditary anaemia of boys, transmitted through unaffected females was described.

Erythroblastosis and its relation to the Rh factor was studied extensively. It was almost twice as common among children of Rh-negative women previously immunized by transfusion than normal. Haemolytic anaemia due to Rh antibodies was not only the initial cause of erythroblastosis, but by damage to the hepatic parenchyma, gave rise to many of the complex manifestations of the disease.

The titre was highest in mother and child eight to 20 days after delivery. Transfusion of Rh-negative blood through the umbilical cord in a prematurely delivered infant was followed by recovery.

Erythroblastosis was, however, reported in children of Rh-positive mothers.

A number of cases showing haemolytic reactions associated with Rh incompatibility were reported.

Haemolytic reactions were found to be present in some patients with cold agglutinins.

Haemolytic anaemia was produced in dogs by the feeding of fat and choline.

The period of 30 days for a donor to regain his original haemoglobin level was reduced to 26 days with iron therapy, and was eliminated entirely with premedication of iron and copper.

In chronic haemorrhage and in anaemias associated with iron malnutrition, and in pregnancy the uptake of a test dose of 15 mg. of iron was 20% to 50% as compared with a normal of -2%.

Although the individual response was quite variable, new experiments showed that ferrous salts were absorbed more rapidly and utilized better than ferric compounds.

In anaemias during pregnancy the marrow changes, correlated with those of the peripheral blood, were valuable indications in prognosis and therapy.

Aplastic anaemia was relieved by removal of an ovarian tumour and of a mediastinal tumour in different patients.

Certain types of refractory anaemia responded to lactobacillus casei factor (folic acid, B<sub>6</sub>).

Delayed poisoning from exposure to benzene manifested itself in aplastic anaemia years later.

An increase in red blood cells containing granules of stainable non-haematin iron (siderocytes) was described in haemolytic diseases and industrial poisons.

In 2,205 rural school children in Florida, 42.3% had haemoglobin values in the range of 3.6 to 11.4 gr. per 100 c.c. secondary to dietary, especially iron, deficiency.

Two-thirds of the natives of northwest India showed hypochromia and iron deficiency, associated with an inadequate iron intake.

East African soldiers showed oedema and effusions during the period of blood regeneration in macrocytic dietary deficiency anaemia.

Dermatitis and macrocytic anaemia were noted in patients with nutritional deficiency.

Hypoproteinaemia was present during the recovery period, corrected by transfusions of plasma.

Diets low in protein, pantothenic acid, casein hydrolysate, zein, pyridoxine or B-complex, were reported as causes of anaemia.

Nutritional macrocytic anaemias were corrected by orally administered liver extracts after being refractory to parenteral medication.

Ultraviolet irradiation caused a slight, but not therapeutic increase in the blood haemoglobin level.

Both haemoglobin and plasma proteins given intraperitoneally to protein-fasting dogs were used effectively to supply the protein requirements of the body.

In anaemia in Eck fistula dogs, standard diet factors and iron were not utilized as efficiently as in control dogs; and the regeneration of haemoglobin was only one-fourth normal in some animals.

When the haemoglobin level was below 7 gr. per 100 c.c. the cardiac output at rest was increased.

Progressive Addisonian pernicious anaemia was treated successfully with choline chloride administered intravenously.

Carcinoma of the stomach was present in 8% of 211 patients with pernicious anaemia and benign polyps in 7.1%.

The first case of transmission of equine anaemia to man was reported.

**Anaesthesia.** In 1945 further developments in the technique of continuous spinal anaesthesia were suggested by Major E. B. Tuohy. A better needle and a better catheter were made available. The new method was more flexible than that in which a particular mattress was needed. Consequently, it became increasingly possible to employ spinal anaesthesia in circumstances such as those presented by orthopaedic operations, wherein especially designed operating tables are necessary. The new developments permitted the anaesthetist to obtain with procaine the results that otherwise could be obtained only with the use of long-lasting anaesthetic preparations. This was an important step, since procaine is much less toxic than long-lasting anaesthetic agents.

The use of curare became widespread. Its advantages were evident both at the time of operation and afterward. During operation it was not necessary to saturate the patient with the anaesthetic agent but simply to provide light surgical anaesthesia. The required relaxation was provided by the curare. The importance of slow administration of curare, rather than its rapid injection, became clear. This change in technique was reminiscent of that which took place as methods of using evipal were developed. In the few minutes required for slow injection of curare, it is possible to give a dose, the effect of which lasts for almost an hour, without stopping the patient's respiration.

The cumulative experience of anaesthetists in the armed forces during World War II made it clear that insufficient facilities for anaesthesia could clog the flow of surgical patients at the front. It became evident that well-qualified physician anaesthetists were needed in forward areas as well as in installations further behind the battle lines. Anaesthetists pointed out that to make up tables of military organization of the future, the progress that had been made in the special field of anaesthesiology would have to be kept in mind. The experience which medical officers gained in the war was reflected in an increasing demand for capable anaesthesiologists.

Certain interesting contributions to the literature of anaesthesia appeared in 1945. One was *The History of Surgical Anesthesia*, by T. E. Keys, which is an excellently documented account. Another was *Man Against Pain*, by H. R. Raper, a dentist, whose interesting book covers the development of modern anaesthesia. The second edition of *Nitrous Oxide-Oxygen Anesthesia*, by F. W. Clement, presents the McKesson-

Clement viewpoint and technique.

In the first six months of 1945, lectures and courses in anaesthesiology were given in several army and navy hospitals. Lectures were given by anaesthetists who were under the sponsorship of the so-called War-Time Graduate Medical Meetings. A variety of plans was considered by which medical officers who had been separated from the service, and who desired training in anaesthesia, might obtain it. Through the Office of Inter-American Affairs, and through the efforts of various special societies, physicians from South America, Central America and even from Europe spent periods of time in the United States visiting various clinics and learning to apply methods of anaesthesia. (See also SURGERY.)

Keys, *The History of Surgical Anesthesia* (1945); Howard R. Raper, *Man Against Pain* (1945); F. W. Clement, *Nitrous Oxide-oxygen Anesthesia* (1945). (J. S. L.)

**Anderson, Clinton Presba** (1895- ), U.S. government official, was born Oct. 23, in Centerville, S.D. He attended Dakota Wesleyan university, Mitchell, S.D. (1913-15), and the University of Michigan, Ann Arbor, Mich. (1915-16). Ill health forced him to give up his studies and he went to New Mexico. In Albuquerque, he worked as a reporter and editor on the *Journal* (1918-22) and later turned to selling insurance. In 1935, Anderson was placed in charge of the state's relief administration, and he was chairman of New Mexico's Unemployment Compensation commission (1936-38). In 1940, he was elected on the Democratic ticket to the federal house of representatives and was twice re-elected. Anderson was divided on support of administration measures. He endorsed several bills inimical to the Roosevelt administration, such as the antistrike measure and the move to investigate government seizure of the Montgomery Ward plants during World War II. On the other hand, he approved in large part the administration's foreign policy. Anderson headed the house committee investigating the food situation, which advocated (April 1945) fusion of the War Food Administration and Office of Price Administration operations in food control. On May 23, President Truman appointed Anderson secretary of agriculture, and on June 29, the president announced the transfer of the War Food Administration to Anderson's control. On July 1, Anderson said the latter move would result in "efficient organization serving agriculture and the people." He predicted (Sept. 24) that the 1946 agriculture program would call for over-all reduction of farm produce, asserting that the sudden ending of World War II had already resulted in surpluses.

**Angling.** During 1945, both fresh- and salt-water angling in the United States continued at wartime levels, although considerable increase in activity was noted in offshore fishing after the end of gasoline rationing and the lifting of coast guard restrictions following the end of World War II.

Only one new world record was established. A rainbow trout of the Kamloops, or Kootenay, variety weighing 32 lb. 8 oz. was caught in Lake Pend d'Oreille, Ida., on July 15 by Laurence Hamilton of Reardan, Wash. This rainbow exceeded the previous record, a steelhead from the Chehalis river in Washington, by 3½ lb.

Anglers generally were unable to obtain new tackle and, although a few items appeared on the market before the end of the year, the supply still was far below the demand.

The annual tournament of the National Association of Angling and Casting clubs, which was held in Detroit, Mich., Aug. 22-26, was won by Lt. Ernest Liotta, Jr., of Cleveland,

O., although S. G. Dennis, of Chicago, Ill., set the only new national casting record with a score of 99 out of a possible 100 in the  $\frac{3}{8}$ -oz. accuracy plug casting event.

In the south, the amount of offshore fishing increased during the fall and winter, with privately-owned boats being used again with gasoline once more available. Many boat captains continued commercial fishing, however, because of the high price of fish, which enabled them to make more from commercial fishing than from guiding.

FILMS.—*New England Fishermen* (Encyclopædia Britannica Films Inc.). (T. Tv.)

**Anglo-Egyptian Sudan.** A territory under the joint sovereignty of Great Britain and Egypt in northern Africa, south of Egypt (*q.v.*). Area 967,500 sq.mi.; pop. (est. 1942) 6,590,996. Chief towns: Khartoum (pop. 1944) including Khartoum North (76,724); Omdurman (pop. 1944) (104,513); Port Sudan (pop. 1943) (35,617); Atbara (pop. 1943) (26,816); El Obeid (pop. 1942) (36,725). Governor-general in 1945: Lt. Gen. Sir Hubert Huddleston; language: Arabic; religion: Mohammedan and Paganism.

**History.**—At the request of five members of the advisory council for the northern Sudan the governor-general in 1945 outlined proposals of which the final aim was self-government for the Sudan and which included a 20-year plan by which it was hoped to fill senior administrative posts in the government by Sudanese as soon as men of sufficient education, character and integrity could be trained for the posts. The opening of the Gordon Memorial college in its new form, as an independent university college (Feb. 21), and the increase of government grants to the college and for post-graduate work outside the Sudan were indications that steps had been taken to make the supply of recruits equal the demands of the 20-year plan, and that the development of education and administrative responsibility of the Sudanese were being correlated.

Demands for the revision of the status of the Sudan were made in Egypt both by the Wafdist party and the premier. Speaking in the senate on Aug. 6 on the revision of the Anglo-Egyptian treaty, the premier said: "As for the unity of the Nile valley, which includes both Egypt and the Sudan, the principles of the new era which have spread all over the world are sufficient guarantee for its achievement. This is particularly the case as this unity reflects the heartfelt desire of all the people of the Nile valley."

Comment in the British press stressed the discrepancy between this view and the British policy of allowing the Sudanese to decide their future status for themselves, and questioned whether every Sudanese would accept the premise of "the unity of the Nile valley." The Egyptian view was expressed more moderately by Mohammed Riadh Bey, chairman of the foreign affairs committee of the Egyptian chamber of deputies and secretary-general of the Saadist party, in London on Oct. 4. He told a press conference that in the condominium of the Sudan, Egyptians would like to see their country taking more than a passive share, but that the most important interests were those of the Sudanese, who should be consulted on their future status.

The cotton crop for 1944-45 was 1,565,309 kantars, a record for the past 20 years. (J. RA.)

**Education.**—(Jan. 1, 1945) Government schools: elementary schools 117, scholars 19,400; intermediate schools 11, scholars 1,847; secondary schools 1, scholars 500; Gordon Memorial college, scholars 134, excluding Kitchener school of medicine; subgrade schools and state-aided Koranic schools 345, scholars 23,000; scholars at nongovernment (mission) schools, 10,200.

**Banking and Finance.**—Revenue (1944) \$40,198,200; ex-

penditure (1944) \$39,978,400; public debt (Dec. 31, 1944) \$36,467,400. Currency: Egyptian pound (£E) = 413.8 U.S. cents.

**Trade and Communication.**—In 1944 imports were valued at \$41,380,000; the value of exported merchandise amounted to \$35,976,300. Communications: roads, suitable for motor traffic, all weather, c. 1,000 mi.; railways 1,991 route mi.; river service 2,325 mi.; motor vehicles licensed (1944) 3,399 cars, commercial vehicles and cycles; telephone subscribers (1945) 3,546.

**Agriculture and Mineral Production.**—(1943-44) Production (in short tons): cotton seed 84,477; ginned cotton (lint) 44,500; millet 521,400; sesamum 54,384; maize 1,342; wheat 10,443; groundnuts 11,500; barley 110; gold (in kg.) (1944) 0.062.

**Anthropology.** With the ending of World War II in Aug. 1945, anthropologists at once moved to re-establish communications with colleagues from whom they had been cut off during hostilities. In England, Sir John Myres, permanent secretary of the International Anthropological congress, initiated attempts to ascertain the fate of members of the bureau of this organization so that it could once more look toward taking up its functions, which had been broken off by the war. Similar efforts in the United States were made by a committee on international co-operation, National Research council. This committee included representatives of the principal anthropological societies, and had the following members: H. Collins, John M. Cooper, F. de Laguna, W. Fenton, Henry Field, Robert H. Lowie, D. Strong, Frank Weidenreich and Melville J. Herskovits (chairman). The first of a series of reports on anthropology in various countries during the war, in this instance France, appeared in the *American Anthropologist* for October, with others scheduled for subsequent publication.

Reports from war areas showed that losses, whether in personnel, museum collections, or library and manuscript materials were not as great as had been feared. It was known that the ethnographic specimens of the British museum had been stored in places of safety, but it was not anticipated that the great Musée de l'Homme of Paris, or Danish, Netherlands and other museums would come through the war practically unharmed. The Musée du Congo Belge at Brussels, however, was damaged by a V-1 bomb, with considerable losses. Russian museums in combat areas were all evacuated in time and were thus unharmed. Buildings of the principal Russian ethnographic museums in Moscow and Leningrad were only slightly damaged, though such structures in occupied areas were destroyed. In many instances by the end of the war specimens had been returned to the larger institutions, and in some cases even been reinstalled. All collections in Czechoslovak museums were entirely destroyed. In Germany, though museum buildings in Berlin, Hamburg, Cologne and Frankfurt were wrecked or seriously damaged, much of their ethnographic and anthropological materials had been removed, except in Munich. Specimens of the Museum für Völkerkunde in Berlin were discovered in a salt mine in Thuringia, and other caches came to light elsewhere after this original discovery.

In the Philippines, the rich ethnographic and archaeological collections made by H. O. Beyer were partially destroyed, while

all the ethnographic field notes of M. Van Overburgh and F. Lambrecht, and the anthropometric data of J. F. Ewing, were lost. All these anthropologists, however, survived the Japanese occupation, as did R. F. Barton who was also caught in the islands. The whereabouts of the priceless remains of *Pithecanthropus erectus* remained a matter for speculation, despite rumours that they had been recovered. Archaeological materials in Java were not disturbed, except for one Mgandong skull sent to Japan and, according to G. H. R. von Koenigswald in *Science* (Dec. 14, 1945), probably lost.

Publications were continued wherever possible. Four out of nine French periodicals appeared during the occupation, seven Norwegian journals were issued, though irregularly, and a considerable number of papers achieved publication in the Netherlands. In Denmark a new society, the Societas Arctica Scandinavica, with a journal, *Acta Arctica Scandinavica*, was instituted; while the centenary of the founding of the department of ethnography of the National museum was celebrated by initiating a new series. The three principal Russian anthropological periodicals devoted to archaeology, ethnography and material culture appeared during the war, while a fourth, newly begun *Kratkie Soobscheniia*, was issued during 1945. The Institute of Ethnography of the Academy of Sciences of the U.S.S.R. held a meeting on June 23 in Moscow, attended by foreign anthropologists who were guests of the academy at the celebration of its 100th anniversary. U.S. delegates were Henry Field and A. U. Pope; C. G. Child represented England. Russian field expeditions continued even during the war, and more had been organized after its end. Italian publication was irregular, though research not requiring field work seemed to have been carried on. In Switzerland the exiled members of the Austrian school, W. Schmidt and W. Koppers, continued their programs of writing and publication.

The year was marked by an expansion in university offerings in a number of countries. In England, E. E. Evans-Pritchard assumed the readership at Cambridge university and S. F. Nadel was scheduled to join the University of London when relieved as senior staff officer to the military government of Tripolitania. University college, London, named D. Forde as professor of social anthropology, but a serious loss was registered when this same institution discontinued work in physical anthropology where it was long associated with the name of Karl Pearson and was carried on more recently by G. M. Morant. The University of Edinburgh announced its intention to establish a lectureship in anthropology.

K. Birket-Smith, who had assumed the head curatorship of the ethnographic department of the National museum, Copenhagen, Denmark, after the retirement and subsequent death of Th. Thomsen, was named to a newly created readership in ethnology at the University of Copenhagen. W. Thalbitzer, professor of Eskimo language and culture in the same institution was succeeded, on his retirement, by E. Holtved, as docent. Ethnography was made a regular subject for examinations and degrees at Stockholm university under the direction of Karl G. Lindblom, and S. Lagercrantz was appointed docent to initiate anthropological teaching at the University of Uppsala, Sweden. On the death of Dr. Walter Kaudern in 1942, his post as director of the Ethnographical department of the Gothenburg museum was filled by K. G. Izikowitz.

In the Netherlands, C. H. de Goeje was appointed to a special professorship in the linguistics and ethnology of Surinam and Curaçao at the University of Leyden; while in France, the Sorbonne instituted a new chair of ethnology. P. Rivet resumed his prewar post as director of the Musée de l'Homme. Jacques Soustelle, assistant director before the war, was minister of information and then minister of colonies in the De Gaulle gov-

ernment. Some field work was initiated by the French; A. Schaeffner and D. Paulme-Schaeffner, the latter the successor of H. Labouret at the École Nationale de la France d'Outre-Mer (formerly the École Coloniale), Paris, left for research among the Kisi and Toma peoples of French Guinea.

Plans were announced for the expansion of the Institut Français d'Afrique Noire at Dakar, Senegal. This institute, in Jan. 1945, sponsored a successful meeting of Africanists from French and British colonies of West Africa, and organized a number of local centres to further its work. An important development was the appointment to the staff of the Rhodes-Livingstone institute, Northern Rhodesia, of J. A. Barnes, E. Colson, R. F. Fortune, J. F. Holleman, M. G. Marwick and J. C. Mitchell, to carry on field studies in accordance with a co-ordinated plan drawn up by M. Gluckman, director of the institute, under grants from the colonial office development project and other agencies.

The Palestine Institute for Folklore and Ethnology issued the first number of its journal *Edoth (Communities)*, under the editorship of R. Patai and J. J. Rivlin. Two numbers of the *Southwestern Journal of Anthropology*, edited by Leslie Spier and jointly supported by the University of New Mexico and the Laboratory of Anthropology (at Santa Fe) appeared. *Afroamerica*, the journal of the International Institute of Afro-American Studies in Mexico City also began publication.

The return of anthropologists from the military and other war services, in many cases to resume their prewar posts, marked the anthropological year 1945 in the U.S. The annual meetings of the American Anthropological association and of the American Folklore society were held for the first time after the beginning of World War II. Ralph Linton was elected president of the American Anthropological association, J. M. Carrière was named to head the American Folklore society, while Herbert J. Fleure became president of the Royal Anthropological institute.

Reports of new researches were few, except in Latin American archaeology. Physical anthropology was represented by an *Introduction* by M. F. Ashley-Montagu, especially useful for the summaries of data concerning recent finds of protohuman forms which it contains. The posthumous volume by Elsie Clews Parsons, *Peguche, a Study of Andean Indians*, a volume of the University of Chicago Press series of anthropological publications, was an outstanding contribution to the ethnology of northern South America. Fay C. Cole's *Peoples of Malaysia* provided a long-felt need for a general work on the peoples of southeastern Asia; M. Fortes published the first part of his study of the social structures of the Tale of West Africa, *The Dynamics of Clanship among the Tallensi*.

In the field of theory Alfred L. Kroeber's *Configurations of Culture Growth* presented the culmination of many years' study of the problem of change in the complexities of human civilization. Based primarily on the history of European culture, it at once aroused controversy and was expected to stimulate discussion for a considerable period in the future. A symposium edited by Ralph Linton, entitled *The Science of Man in the World Crisis* at the instance of the Viking fund, discussed the contribution of anthropological science to problems of the present-day world. Abram Kardiner and others collaborated in a volume, *The Psychological Frontiers of Society*, elaborating this student's concept of the basic personality structure. A second posthumous work of Bronislaw Malinowski, edited by Phyllis M. Kaberry, *The Dynamics of Culture Change, an Inquiry into Race Relations in Africa*, expanded Malinowski's earlier papers on this topic, and presented a conceptual scheme for its study.

Also to be noted were works by Leo W. Simmons, *The Role*

of the Aged in Primitive Society, a cross-cultural study based on world-wide sampling of the literature, of an aspect of native cultures that has too rarely been considered. Paul Radin returned to his Winnebago materials with his volume *The Road of Life and Death*, a discussion of the medicine rite of this people based on texts recorded in the field. Martin C. Yang extended knowledge of Chinese ways of life with an anthropological treatment found in his book *A Chinese Village, Taïton, Shantung Province*.

Contributions in the journals include the further statements of the neo-evolutionist position of L. White, "Diffusion vs. Evolution, an Anti-Evolutionist Fallacy" (*Amer. Anth.*, July 1945), and "History, Evolutionism and Functionalism: Three Types of Interpretation of Culture" (*Southwestern Journal of Anth.*, Summer 1945); and M. Opler's "Themes as Dynamic Forces in Culture" (*Am. Journal of Sociology*, Nov. 1945). Hermann J. Braunholz' presidential address to the Royal Anthropological Institute of Great Britain and Ireland, London, "Culture Contact as a Museum Problem" (*Jour. Roy. Anth. Inst.*, 1942, published 1945), presented a new facet of the problem of acculturation that is outstanding in the interests of students of culture. (M. J. Hs.)

Consumption, primary . . . . .	17,955	29,994	23,852	19,508	23,756

\*Antimony content of antimonial lead produced from foreign and domestic ores.  
†Estimated antimony content of alloys, oxide and liquated sulphide.

There was little production of metal from straight antimony ores; most of the output came from complex ores in combination with lead, silver, copper or tungsten. The passing of the war peak of demand was signalled by the reduction in output in 1944, and by a drop in producing mines from 17 to 11. Early in 1945 two of the five metal smelters shut down.

Other producers showed declines in 1944 similar to those in the United States—Mexico from 13,873 short tons to 11,085 tons; Bolivia from 18,228 tons to 7,553 tons and Peru from 2,725 tons to 1,008 tons; Canada increased from 513 tons to 901 tons. Most of the smaller producers showed declines of the same order. (G. A. Ro.)

**Anti-Saloon League of America:** see SOCIETIES AND ASSOCIATIONS.

**Anti-Semitism.** The defeat of Germany in 1945 put an end to the official spread of anti-Semitism by the propaganda machine of the German government. The occupation by the Allied armies brought everywhere a restitution of civil rights to the Jews. On the other hand, official investigations revealed for the first time the whole extent of the deliberate extermination of European Jewry by Germany. It was estimated that at least 80% of Germany's Jews had been murdered. Official plans had marked every remaining Jew in German-occupied Europe for extinction before the

JEWISH SLAVE LABOURERS marked with the yellow cross were liberated by troops of the U.S. 9th army near Kaunitz, Germany, in 1945. These girls had been brought from conquered countries and made to work in an ammunition plant.

summer of 1946. Even worse, if that be possible, than the fate of the German Jews themselves was the fate which befell the Jews in eastern European territory, especially in Poland and Russia, occupied by the Germans in 1939 and 1941. Nor were the Jews in western Europe spared: in the spring of 1943, Jews from France, Belgium and the Netherlands were deported to eastern Europe where systematic extermination of the Jews by gas had started. Many Jews were brought to Germany as slave labourers and were subject to a regime in which starvation, disease and cold undermined their strength. After Germany's defeat these "displaced persons" who came from eastern Europe created a serious problem for the Allied occupational authorities, as their repatriation met with great difficulties.

The few German Jews remaining in occupied Europe were returned to their homes, Jewish synagogues were reopened and the first Jewish services were held in Germany after Nov. 1938. The restoration of confiscated property was slow because complicated administrative and judicial machinery had to be set up. As many nazis remained in subordinate positions in Germany, complaints of persisting anti-Semitism continued to be heard. For some time Jews were subjected to the same restricted rations as non-Jewish Germans until it was pointed out that as a result of many years of deliberate semistarvation the Jews needed higher rations than the general population.

The U.S. representative on the Inter-Governmental Committee on Refugees, Earl G. Harrison, reported to President Truman on the shocking conditions in the camps for displaced Jews in Germany and Austria. As a result of President Truman's intervention and of directives issued by Gen. Dwight D. Eisenhower these conditions were substantially improved.

It was too early to make a definite estimate of the number of victims of German anti-Semitism. In a country like Yugoslavia the Jewish population was reduced from 75,000 to 6,000. From the Netherlands about 110,000 Jews were deported, of whom only 5,000 returned. Norway, where there was a Jewish population of less than 1,000, saw 734 of them deported and only 12 returned. From France the number of Jews deported was estimated at 105,000, the number of Jews returning, as less than 4,000. All the others died in Auschwitz, Belsen, Buchenwald and the other camps.

No trace of official anti-Semitism remained in France, the Low Countries and Italy. The anti-Semitic legislation of

fascism had taken no deep roots in Italy. According to all reports the Italian population behaved in a friendly and helpful way toward its Jewish fellow citizens throughout the period of German occupation.

On the other hand, complaints about continuing discrimination against Jews in Poland and other eastern European countries were frequently voiced. In view of the secrecy veiling the happenings in these lands little authentic information reached the outside world in 1945.

As unsatisfactory as in Poland was the situation of the Jews in Argentina. There the followers of Col. Juan D. Perón tried to organize anti-Semitic disturbances. Anti-Semitism became part of the antidemocratic and anti-United States policy of the Argentinian nationalists. (*See also* FASCISM; JEWISH RELIGIOUS LIFE; REFUGEES.) (H. Ko.)

**Aquariums.** The status of public aquariums throughout the world remained unchanged during 1945; those surviving the troubled times of the World War II years managed to keep open, with restricted exhibits, without much further difficulty. None of those closed during 1942-45 reopened, however, and the ending of hostilities in 1945 did not mitigate the difficulties of collecting and transporting fishes nor improve the conditions of shortages of trained personnel, material or equipment. Popular interest in public exhibitions of fishes remained unabated, however, for in many cities and several countries, plans for the construction of new institutions and the renovation of old ones crystallized during the year, and the start of physical building of several was to take place as soon as possible, probably during 1946. The most notable of these are the aquarium at Miami, Fla., a co-operative exhibition and research plant to be built jointly by the University of Miami and Dade County, Fla., and the New York aquarium, a joint operation between New York city and the New York Zoological society.

(C. W. C.)

**Aqueducts.** The Metropolitan aqueduct (241 mi.) delivers Colorado river water, regulated by the bureau of reclamation's Boulder and Parker dams, to Los Angeles and 12 other California cities. This aqueduct was constructed in 1943 at a cost of \$200,000,000 by the Metropolitan Water district comprising these 13 municipalities. The capacity of the system is 1,000,000,000 gal. per day. The aqueduct extends from Parker dam to Cajalco reservoir, 12 mi. south of Riverside, Calif.

Bureau of reclamation engineers in 1945 prepared the designs and specifications for the 71-mi. San Diego aqueduct under construction by the navy department. This aqueduct was expected to be capable of delivering 50,000,000 gal. of Colorado river water daily to San Diego, Calif.

The Salt Lake aqueduct was being built by the bureau of reclamation on the Provo river project, Utah. This 41-mi. structure was to tap Deer Creek reservoir, providing water for industrial and domestic purposes in Salt Lake City, Utah, and in addition serving irrigation needs.

Another water conductor under construction by the bureau on the Provo river project was the Duchesne tunnel. This 6-mi. structure, when completed, would divert water for irrigation

purposes from the upper tributaries of the Duchesne river (Colorado river watershed) to the Provo river for storage in Deer Creek reservoir. The tunnel was to have a capacity of 375 cu.ft. per second.

The Estes Park aqueduct was to be constructed by the bureau as a part of the Colorado-Big Thompson irrigation project. Another important feature of this reclamation development was the 13-mi. Alva B. Adams tunnel, being lined with concrete in 1945. The tunnel through the Rocky mountains under the continental divide was planned to bring Colorado river water from the western or Pacific slope of the Rockies to the eastern side, furnishing supplemental irrigation water for 615,000 ac. of fertile farm land in northeastern Colorado.

The All-American canal, a part of the Boulder canyon project, taps the Colorado river at Imperial dam downstream from Boulder dam. This 80-mi. canal, completed in 1940, serves approximately 500,000 ac. of irrigable land in the Imperial valley of California.

The Coachella canal, planned to be a 145-mi. branch of the All-American system, was under construction by the bureau to serve irrigation needs of approximately 75,000 ac. of land in the Coachella valley of California.

The canal system of the multimillion acre Central valley project under construction by the bureau of reclamation in California would consist of the Madera canal, the Friant-Kern canal, the Contra Costa canal, the Delta Cross channel and the Delta Mendota canal.

The 37-mi. Madera canal was completed in June 1945. Construction work on the 160-mi. Friant-Kern from Friant dam to Bakersfield, Calif., was started in Aug. 1945. These two large gravity canals were designed to carry water from Millerton lake, storage reservoir created by Friant dam, to the fertile San Joaquin valley. The first water was delivered through the Madera canal in 1944. It has a capacity of 1,000 second feet. The Friant-Kern canal was to have a capacity of 4,000 second feet. The 47-mi. Contra Costa canal was almost completed. Industries in the Antioch-Pittsburg area of the Delta region of Central valley were provided with water by means of this system during 1944. The canal has a capacity of 350 cu.ft. of water per second.

The Delta Cross channel and the Delta Mendota canal were also scheduled for construction on the Central valley project. The 50-mi. Delta Cross channel with 8,000 to 10,000 second feet diversion capacity was to carry Sacramento river water to the San Joaquin river. The 120-mi. Delta Mendota canal with a diversion capacity of 4,600 second feet was designed to transport the water along the west side of the San Joaquin valley to Mendota pool. (*See also* CANALS AND INLAND WATERWAYS; DAMS; TUNNELS.) (K. W. M.)

**ARA:** *see* AGRICULTURAL RESEARCH ADMINISTRATION.

**Arabia.** Total area (est.) 1,000,000 sq.mi. Total pop. (est. 1939) 7,000,000; (earlier est.) Saudi Arabia 1,500,000; Yemen 3,500,000; Oman and Muscat 550,000; Kuwait 80,000; Trucial Sheikhs 80,000. Language: Arabic; religion: Mohammedan. Rulers: Saudi Arabia, King Abdul-Aziz ibn Abdurrahman al-Faisal Al-Sa'ud; Yemen, Zaidi Imam Yahya ben Muhammed ben Hamid ed Din; Oman and Muscat, Sultan Sayyid Sa'id ibn-Taimur; Kuwait, Sheikh Ahmad ibn-Jabir as-Subah.

**History.**—In Feb. 1945 Ibn Sa'ud met both Pres. Roosevelt and Winston Churchill on their return from the Crimea conference. Later in the year the texts were published of an exchange of letters between the king and Pres. Roosevelt which took place after their meeting. The king expounded the Arab

PRESIDENT ROOSEVELT, returning from Yalta, received King Ibn Sa'ud aboard a U.S. destroyer in Great Bitter Lake near Cairo, through which the Suez canal passes, Feb. 20, 1945. The king's 800-mile journey marked a first departure from Arabian soil

case in Palestine, and in reply the president expressed the desire of the U.S. government "that no decision be taken with respect to the basic situation in that country without full consultation with both Arabs and Jews." He also assured Ibn Sa'ud that he would take no action in his capacity as chief of the executive branch of the U.S. government, which might prove hostile to the Arab people.

Ibn Sa'ud declared war against Germany and Japan on March 1, 1945, excluding, however, from this declaration the holy places of Mecca and Medina.

The king was embarrassed, in the autumn, by the arrival on his territory of Rashid Ali al Gailani, an ex-premier of Iraq, who had been condemned to death in his absence by an Iraqi court on account of his *coup d'état* in 1941. The extradition of Rashid Ali was demanded by the government of Iraq but compliance with a demand of this kind is incompatible with traditions of Arab hospitality which still have a strong hold in the Arabian peninsula.

Prince Faisal, the king's foreign minister and second son, who led the Saudi Arabian delegation at the San Francisco conference, also conducted conversations in Washington, D.C., before he left the U.S., on economic and political questions of mutual interest to the two countries.

**Finance.**—Monetary unit, in Saudi Arabia is the Saudian rial. Exchange rate in 1942: 1 rial=Rs. 1 (Indian)=30.12 U.S. cents.

**Trade.**—With India (1939-40): Oman and Muscat, imports \$741,000; exports \$1,076,000; other states of Arabia, imports \$298,000; exports \$2,208,000. With the United Kingdom (1938): Saudi Arabia and Yemen, imports \$383,000; exports \$116,100; Oman and Muscat, Trucial Sheikhs and Kuwait, imports \$162,200; exports \$74,000. Total trade of Oman and Muscat (1938-39): imports \$1,468,000; exports \$1,002,000; Kuwait (1937-38): imports \$1,655,600; exports \$701,200. Saudi Arabia exports: skins, wool, gold, charcoal, cattle, dates, clarified butter, gum.

**Arce y Ochotorena, Emanuel** (1879- ). The cardinal archbishop of Tarragona was born at Ororbia in the province of Navarre, Spain, on Aug. 18. He was educated in seminaries of Pamplona and Saragossa and at the Gregorian university in Rome.

Named bishop of Zamora in 1929, he headed this see during

the difficult years of the republic. He specialized in labour studies and contributed both knowledge and action in the solving of social problems. Under his inspiration there was a development of Catholic Action in the archdiocese of Tarragona.

Transferred from Zamora to the diocese of Oviedo in 1929, he had as his first great task the reconstruction of destroyed or damaged churches of the Asturias region, including the Oviedo cathedral. At the same time he was serving as apostolic administrator of his former diocese. He was elevated to the metropolitan see of Tarragona in 1944. He is the author of several books on canon law and various pastorals dealing with dogma and morals. He was created and proclaimed a cardinal at consistory on Feb. 18, 1946.

**Archaeology.** Eastern Hemisphere.—With the end of World War II, fuller reports as regards the damage and destruction of archaeological monuments and collections began to come in. The reports were most complete for Italy; the extent of damage in the rest of Europe and in the far east was not so well known at the close of 1945. The United States and British military services concerned with the conservation of antiquities seemed to have done their best against great odds.

The list of destroyed or badly damaged monuments in Italy would be long; the great fortune was that so much was saved. Save for Pompeii, none of the great Roman antiquities was seriously affected. Such buildings as Santa Chiara in Naples and Campo Santo in Pisa were gutted; the main bridges at Florence and Verona were destroyed. In many cases, buildings which were protected with sand-bags suffered, as the bags were of paper and burned with an intense heat, ruining painting and sculpture.

The Free French had listed, for the supreme command, the 25 monuments which they prized most highly. None of these was damaged during the saturation bombing. Of some 10,000 official French monuments, 8,000 received some damage but in no case was it irreparable.

Reports of the details of archaeological destruction in Germany were not complete at the close of 1945, but it was known that the most important collections were removed during the bombing. The Porta Nigra at Trier was badly damaged, as were many Mediaeval and Renaissance buildings in Nuernberg and Munich.

The main collections of the north Russian museums were kept safely in hiding places in the Urals, but terrible damage

came to the materials in Kiev, and to many local museums in the Ukraine and the Caucasus.

The antiquities of Crete were most fortunately preserved, considering the actions which took place on the island. Sites of lesser importance (Ag. Triadha, Palaioakastro, Amnisos) and the local museums at Sitia and Ierapetra suffered some vandalism, but Knossos and Phaestos saw no serious harm.

In Greece, the major antiquities and the contents of the greater museums were essentially unharmed by the war, although some cases of minor theft or looting were reported. In the hostilities which followed the retreat of the Germans, the British reported that the Acropolis was hit by 32 E.L.A.S. bombs or shells, but that very few even bruised the monuments. The Parthenon received minor splinters in two places. The monuments in the city of Athens suffered some bullet scars; no details were available concerning the more important sites in the countryside. Reports of looting in the National museum proved to be false, and no damage came to any of its antiquities.

In America, and in the less devastated portions of Europe, new plans for the continuation of archaeological activity were being laid. However, with inflation in many European countries, and political instability in some, full scale excavations would probably not be resumed for several years.

A most provocative conference on the problems and prospects of European archaeology took place late in 1944, at the Institute of Archaeology in London (*Occ. Pa.* 6). Prof. V. Gordon Childe's introduction inventoried the present status of archaeological knowledge in a general way, recalling the distortions of the interpretations of archaeological material which followed from various state-supported projects, especially in the totalitarian countries. He also pointed to some major problems: the distribution of lower palaeolithic hand-axes, the area of origin of the Solutrean and of the blade tool-traditions, the effect of the deflation of Ertebolle dates on the general picture of the mesolithic, and the need to re-examine claims of potentially domesticable plants and animals in mesolithic horizons. Childe censured those excavators who ignore the unspectacular items in their excavated materials; in an attempt to study early querns, he found shocking inadequacy in the presentation of these humanly most important objects.

The most remarkable archaeological discovery reported in 1945 was that of the Iraq government excavations at Tell Hassuna, in the upper Tigris river valley (see below).

*The Palaeolithic-Mesolithic Periods.*—There was little to report of new Stone age materials from Europe. The Italian excavator L. B. Brea, who made fresh excavations in the Ligurian cave of Arne Candide in the early war years, was captured by the British, to whom he gave information as to the stratigraphy of the site. Eight levels were exposed in a depth of *c.* 10 metres; these proceeded from Upper Aurignacian to Roman.

Several general statements and summaries of Russian archaeological activity appeared during the year (*e.g.*, Prof. E. H. Minn's "Note on Russian Archaeological Literature" in the *Antiquaries' Journal*; V. Gordon Childe's article in *Nature* [no. 3956] and his review of "Tripil's'ka Kultura" in *Antiquity*, and the U.S.S.R. section in the "Archaeological News" of the *American Journal of Archaeology*). The work of Russian archaeologists themselves became significantly clearer with the appearance of P. P. Efimenko's *Paleolit i Neolit SSSR* (Materialy i issledovaniia po Arkheologii SSSR, no. 2), a collection of some 21 papers by Russian archaeologists, which reports work done up to the time of Russia's entry in World War II. The papers mainly concern upper palaeolithic to neolithic materials, and have concise but usable French summaries. The volume also includes a very valuable list of palaeolithic sites in the U.S.S.R., complete up to 1938, and with brief notes and the

principal bibliography on each site. The list is given in terms of "primitive Mousterian and Clactonian," "Mousterian," and "upper palaeolithic and epipalaeolithic," and the sites with materials so classified are then listed regionally for both European and Asiatic Russia.

There was little good news from the far east. The *Sinanthropus Pekinensis* physical material was reported to have been lost with the torpedoing of a ship; late reports of fossil human material from Choukoutien recovered in Japan seemed to refer to the "Upper Cave" specimens. Prof. G. von Koenigswald wrote that he survived the occupation of Java, and that his *Pithecanthropus* materials are intact.

Archaeological work continued in Africa during the war, and several important finds were reported. Prehistoric exploration in South Africa was stimulated by the presence of the great French prehistorian, the Abbé H. Breuil, who escaped the occupation of his homeland.

A preliminary report appeared in *Man*, of excavations in the "Border Cave," in the region of the boundary between Zululand and Swaziland, South Africa. An adult human skull had appeared while a native was digging for fertilizer in the cave; the joint Bureau of Archaeology-University of Witwatersrand investigation yielded "a rich industry of Middle Stone age times (Pietersburg Culture), showing continuous development of the industry during a considerable period of time." Fragments of an infant skeleton were found *in situ*. For the adult skull, morphological comparisons are made with the Springbok Flats, Fish Hoek and Florisbad skulls.

Professor C. van Riet Lowe presented an important paper in *Man* on the evolution of the Levallois technique in South Africa. Regardless of the fact that the South African sequence might not be directly linked to the geochronological scheme available for Europe and the Himalayas, it was noteworthy to have the word of a prehistorian of Lowe's competence that the Levallois developed as a technical process "through a period of much greater length than is covered by the development of its European counterpart," and that the South African Levallois technique "is an integral part of the Great Hand Axe Culture and not an independent parallel development."

Two late (neolithic) but interesting groups of African finds were reported, that from the "Bosumpra" cave near Abetifi, Gold Coast Colony, by C. T. Shaw (*Proc. Prehist. Soc.*, x), and that by Mary D. Leakey at Hyrax Hill, Nakuru, Kenya (*Trans. Roy. Soc. S. Africa*, xxx). Both sites yielded materials which indicate that domestication had probably taken place; while the Gold Coast site is a cave, the Kenya site proved to have been that of pit-dwelling village people.

*The Near East.*—The most outstanding report on protohistoric material to appear in 1945 (*Journal of Near Eastern Studies*, iv) was on the excavations at Tell Hassuna, 22 miles south of Mosul, in northern Mesopotamia. On this site, Seton Lloyd and Fuad Safar recovered for the Iraq government Directorate General of Antiquities a remarkable sequence of materials in the range of the earliest village culture assemblages of western Asia. The basal layer in the sequence contained three superimposed "camp sites" with hearths, coarse pottery, and both chipped and ground stone tools.

Above the "camp sites" were at least six successive architectural phases, characterized by Lloyd and Safar as the "Hassuna levels." The several-roomed adobe buildings of these levels contained three major groups of pottery, the "Hassuna archaic," the "Hassuna standard" and the Samarran (the first group restricted to the lowest floors, the last group to the middle and upper floors). The first two ceramic groups were tentatively known from the minute exposure of Nineveh I—hitherto the earliest north Mesopotamian village material. Various small

EXCAVATIONS in the fourth layer of six prehistoric levels at Tell Hassuna in the upper Tigris valley, Iraq, reported on in Nov. 1945

objects in clay, stone and bone appeared; the sustenance pattern was indicated by sickle blades, silos and the bones of domesticated sheep (or goats) and cattle as well as of wild animals. There were burials, but the bones seem to have been badly preserved, and no studies of the human physical types were yet available.

The "Hassuna levels" were superimposed by levels containing pottery of the Halaf range, then of the Ubaid range, and in the disturbed surface layer there was Assyrian pottery.

The importance of the Hassuna discovery is in the area of the exposure made and in the bulk of material reclaimed and presented from so early a range of village materials. The excavators possibly exaggerated the difference between the basal "camp site" material and that from the "Hassuna levels"; since the latter was already present in Nineveh I, the claims made in press releases on Hassuna as to its being the earliest village yet known needed qualification (cf. *Time*, Nov. 12, 1945). Actually, insofar as means of dating is reliable for those times, there were excavated village materials of equivalent antiquity from Iran to Egypt. However, Hassuna's importance appeared to be self-evident; it also depended to some extent on the fact that the position of the Samarran pottery is stratigraphically fixed. Primarily, Hassuna contributes significantly to an understanding of the beginnings of settled life in the area where, subsequently, civilization made its first appearance.

The first volume of the final *Tell Halaf* (H. Schmidt, Berlin, 1943) publication reached the U.S.; the famous pottery from this site which gives its name to one of the early west Asian village cultures, seems well presented. It is clear, however, that Tell Halaf contains Transitional Halaf-Ubaid and Ubaid pottery as well as the classic Halaf style.

The preliminary report on "Two Sondages on the Coast of Syria, South of Tartous" by Robert J. and Linda Braidwood (*Syria*, xxi) became available. A discontinuous sequence of materials from pre-Halaf to Byzantine times was discovered in

two mounds, Tabbat al-Hammam and Tell Simiriyan. The former mound appeared to have been the site of an important Phoenician town with a breakwater and harbour installation, and also yielded the southernmost *in situ* occurrence of the pre-Halaf dark-faced burnished ware complex.

Nelson Gleuck (in *Bulletin of the American Schools of Oriental Research*) reported on intensive surface explorations on Tell Umm Hamâd esh-Sherqi, a low mound in the Jordan valley. By careful comparative study of the potsherds obtained, he postulated a main period of occupation in Upper Chalcolithic (Beth Shan XVII-XVI) times, c. 3400-3200 B.C., and a smaller occupation in Early Bronze I times. Taken with other sites already explored or excavated, Gleuck believed his survey makes it possible to demonstrate that "Chalcolithic civilization" in the Jordan valley was "widespread, well established, and obviously built up on a well-developed system of irrigation agriculture." Such a postulate might have some bearing on W. C. Lowdermilk's suggested "TVA on the Jordan."

Information on inscriptions written on ossuaries found in a tomb on the Jerusalem-Bethlehem road, and first announced by Prof. M. Sukenik of the Hebrew university as having been inscribed to "Master Jesus" and bearing the sign of the crucifixion, was later tempered by a statement of the department of antiquities of Palestine. The statement made clear that the inscriptions are not extensive. Two of the ossuaries bore the name "Iesous" in Greek, which was the common Jewish name "Joshua" at that time, and one was marked with a cross identical with the ancient Hebrew letter "Tav." Until the final study is complete, the department's statement concluded that "it would be premature to assume any connection between this tomb and any known event or person in sacred history."

*The Tombs and Moon Temple of Hureidha (Hadhramaut)* by G. Caton-Thompson appeared in the U.S. during 1945 (late 1944 in England). The volume reports excavations in southern Arabia, mainly in the time range between the 7th and 3rd centuries B.C., at the time when the spice- and incense-bearing

caravans flourished. The report is a model of completeness, with studies varying from the Quaternary geology of the region to the physical anthropology of the remains found in the tombs. The temple is architecturally "indebted to the Near Eastern Asiatic world of the last five-and-a-half centuries before Christ," while beads and seals in the tombs connect with Syria and Persia in the time range of the 7th to 4th centuries B.C.

The *Chronique d'Égypte* (nos. 39-40) contains all of the communications issued by the *Service des Antiquités* of Egypt on excavations from 1939 to 1944; it also includes an account of the 1944-45 season of the Royal Excavations at Helouan. Here, 847 tombs were discovered, 149 of which were intact and most of which dated to the First and Second dynasties. Some of the larger tombs had limestone walls and floors, a construction detail hitherto unknown in the First dynasty. Cases of from one to four holes in the upper part of the portcullis slab are explained as having been made originally to receive ropes used in lowering the slab into place. In a later sarcophagus, there was an inscription which included the name of the town, Heliopolis, which the cemetery probably served. A new position for the customary stela, in the tomb chamber, is also suggested.

*Belleten* indicated the continuing and the new activities of the Turkish Historical society. Important new material from the sites of Düdartepe and Tekeköy, near the Black sea port of Samsun, was presented by K. Kökten and N. and T. Özgüç; this includes dark-faced burnished pottery, "mother goddess" figurines, and metals from the little known area of northern Anatolia. A summary of the present status of Turkish proto-historic chronology by T. Özgüç also appeared. Dr. Hamit Zubeyr Kosay, in the *Illustrated London News*, reported on the continuing work at Alaca Hüyük, with illustrations of some new material including copper human figurines.

*Europe*.—An assessment of the present status of "Air Photography and Archaeology" is made by J. K. St. Joseph in the *Geographical Journal*. *Nature* contained H. Godwin's account of the work of the Swiss pollen-analyst Max Welten, whose investigation of a small filled-up lake basin in the Bernese Oberland has yielded a geochronology from postglacial times to the present. Early human activity in the area is indicated by changes in pollen frequency and by the appearance of the pollen of cereals and of such introduced trees as walnut. There is evidence of a retrogression in the ameliorating climate at about 6150 B.C.; at 5400 B.C. the mixed oak forests were markedly extended, while beech became dominant about 3200 B.C.

Spanish excavations at Ampurias, the "Spanish Pompeii," were continued, with the exposure of several blockhouses with fine mosaic and stucco decoration. Work in the cemetery yielded wearing apparel, jewellery, and funerary urns in lead and glass.

Don Juan Cabré began work on a unique Visigothic city and basilica, on the banks of the Tagus near Zorita de los Canes.

Excavations on the site of the 10th century summer palace of the caliphs near Cordova, yielded important architectural decorations of Spanish Moslem times.

Archaeological news from the European countries directly affected by the war consisted mainly of chance finds, or of finds exposed by bombs. The Danes reported antiquities of such age (10,000 years) that the makers must have been present in Denmark during the recession of the last glaciation. A farmer plowing near Athens turned up the marble figure of a 5th century B.C. Greek youth. Bombs laid bare an intact Norman chimney in England, and also a tessellated Roman floor in an almshouse, which had long been covered.

**BIBLIOGRAPHY.**—*American Journal of Archaeology*; *Antiquaries' Journal*; *Antiquity*; *Bulletin of the American Schools of Oriental Research*; *College Art Bulletin*; *Geological Magazine*; *Geographical Journal*; *Illustrated London News*; *Journal of Near Eastern Studies*; *Man*; *Museum News*; *Nature*; the *New York Times*; *Science*; *Türk Tarih Kurumu (Belleten)*.  
(R. J. B.)

**Western Hemisphere.**—Despite the war there were numerous archaeological investigations undertaken in the western hemisphere during 1945. Although none of these investigations was carried out on a large scale, many of them contributed significantly to new world prehistory. There were no large expeditions, yet many relatively small research projects offered promise of solution to problems of considerable magnitude. The following summaries of archaeological activities are arranged by area.

*Eastern North America.*—Dr. A. R. Kelly of the national park service directed a brief surface and test-pit survey of the Jessup Bluff site located within the southern boundaries of the Ocmulgee National Monument near Macon, Ga. This site yielded implements of chipped stone, fragments of soapstone vessels and the following pottery types: *Swift Creek Plain*, *Swift Creek Complicated Stamp*, *Napier Complicated Stamp*, fibre-tempered ware, and a small checked stamp ware. This site seemed to belong to the early Swift Creek period of central Georgia.

Under the direction of Glenn A. Black of the Indiana Historical Society, a party of students from Indiana university carried out excavations in the middle portions of the famous Angel site in Vanderburg county, southwestern Indiana, and conducted an archaeological survey of the Wabash drainage. The Angel site is a large village and ceremonial centre of the Middle Mississippi type. These archaeological investigations were undertaken over a period of four-and-one-half months.

During the first part of 1945 the Ohio State Archaeological and Historical society installed the archaeological exhibits in the Fort Ancient museum which is a part of the Fort Ancient memorial. The new museum, located on the portion of the memorial which contains the Anderson Village site (component), houses one of the most complete collections of artifacts relating to the Fort Ancient aspect (culture).

The exhibits deal with such activities of Fort Ancient culture as the village, agriculture, hunting and fishing, household life, personal and social life, manufacturing processes, burial customs, pottery, and the utilization of animal life. The museum also contains a large collection of artifacts, skeletal material and faunal remains, notable among which is the extinct Carolina parakeet.

During May, June and July 1945, the Illinois State museum sponsored the excavation of a large Hopewell burial mound near Havana, Ill. The excavations, supervised by Richard MacNeish, were undertaken at the invitation of the Illinois Power and Light company who planned to level the site for building purposes and whose officials recognized the possible scientific importance of the mound.

This mound, one of a group, some of which were excavated in 1928 by the University of Illinois, was 150 ft. long, 100 ft. wide and 25 ft. high. At the base of the mound there were extended burials accompanied by copper beads, perforated bear teeth, large beads of conch shell, and a rectangular gorget of polished stone. Beneath the mound there were postholes whose pattern indicated a rectangular structure with rounded corners. Tests of the extensive village site beneath and around the mound showed three feet of cultural debris in which there were Central Basin pottery types overlain by typical Illinois Hopewell pottery types and some pottery styles perhaps intermediate in type between Central Basin and Hopewell.

In early June and again in early October test excavations of the Weaver site in Fulton county, Illinois, were made by students and faculty of the department of anthropology of the University of Chicago. This large village site contained cultural refuse to a depth of five feet, and numerous dwelling levels manifested by hearths, burned floors, and postholes. Pottery and other artifacts were abundant in the cultural detritus. Stylistic trends of the pottery showed a transition from Hopewell types to Woodland types reminiscent of the Maples Mills focus.

The archaeological record from the Havana village and the Weaver site is extremely important because it seems to present evidence accounting in part for the development and disappearance of the Hopewell complex in Illinois.

In April the department of anthropology of the University of Chicago sponsored a brief survey of an historic site near Starved Rock on the Illinois river. The excavations were undertaken by Richard MacNeish and Donald Wray. This site, believed possibly to have been a Kaskaskia village mentioned in late 17th century French reports, was tested by means of trenches that revealed Indian cultural materials associated with trade objects of European manufacture. The pottery from this site is an Upper Mississippi style somewhat resembling Oneota pottery and pottery from the upper levels of the Fisher site in Will county, Illinois.

Continuing his researches in the Manitoulin district of Ontario, Dr. Emerson F. Greenman of the Museum of Anthropology of the University of Michigan spent the summer months in contour mapping and a search for new sites. Excavations were continued in four sites which are geologically datable by their association with old beach levels of the post-glacial stages of the Great Lakes. The most ancient of these sites is perhaps 10,000 to 15,000 years old.

A secondary project was tracing the Mackinac-French river route to Montreal used by Frenchmen and Indians in the 17th century. In the Killarney part of the route some of the channels then used are now dry because of the subsidence of the Great Lakes caused by the uplifting of the land. Data on these dry channels were expected to be of assistance to geologists in assessing the rate of uplift and in ascertaining the age of old beach levels. The chronological information thus obtained might be applied to cultural associations of these beaches.

A prehistoric Indian site in Macomb county, Michigan, was excavated for the Cranbrook Institute of Science under the direction of Paul Cooper of the department of anthropology of Columbia university. The cultural remains from this site were indicative of the Youngs focus (Woodland pattern).

Members of the Detroit Aboriginal Research club excavated a mound on the north shore of the Detroit river. This mound, now within the boundaries of Fort Wayne, an army post, was partly dug by Henry Gillman in 1870. Artifacts recovered from the site are indicative of middle Woodland culture.

One of the most significant contributions to North American archaeology was the excavation of an Old Copper site in Grant county, Wisconsin, by the Milwaukee Public museum. Although the presence of the Old Copper culture had been suspected for many years, it was not until the summer of 1945 that a site was discovered.

The fact that an assemblage of heavy tools and weapons of copper with a characteristic patination had never been associated with any culture in the relative chronology of the upper Great Lakes region had led W. C. McKern to suggest that there was an Old Copper industry which antedated the known cultures of the area. Robert Ritzenthaler's excavation of the site in Grant county confirmed McKern's hypothesis.

Investigation of the site revealed bundle burials, scrapers and notched projectile points of chipped stone, and tools and weapons of copper. The metal complex of the Old Copper culture included socketed knives and spearheads of several varieties; crescent-shaped knives; harpoon heads; socketed axes or adzes (popularly called "spuds"); awls; pipes; chisels; various styles of knives with tangs; and spearheads with various styles of tangs. Pottery and other traits of later cultures were lacking.

Under the direction of Dr. Charles R. Keyes a group of students from the Cornell (Iowa) Summer school excavated three rock shelters in Spring Hollow at the Palisade State park, Iowa. Data from two of these shelters would aid in the solution of problems connected with the Maquoketa aspect of the Woodland culture pattern.

During the summer of 1945 the Robert S. Peabody Foundation for Archaeology of Phillips academy, Andover, Mass., resumed excavations at an ancient village on Grassy Island in the Taunton river. The site, once inundated by a rise in sea level, is now covered by a layer of marine peat from two to five feet thick. About 1,000 stone artifacts had been excavated from the old village. Analysis of the marine peat might enable an estimate of the age of the site. The work at this site was undertaken by Frederick Johnson of the Peabody foundation and Hugh M. Raup of the Arnold arboretum, Jamaica Plain, Mass. Early publication of a report of these investigations was planned.

A number of small sites in the Shawsheen river valley were extensively tested for the Peabody foundation, Andover, by Riply P. Bullen. A tentative stratigraphy was formulated. The stratigraphy involves both changes of artifact types and events of possible geologic significance.

Various research projects were carried out by members of the chapters of the Massachusetts Archaeological society. These projects included excavation of a contact period site at Winnecunnet Lake and aboriginal steatite quarries at Westfield and North Wilbraham.

In Connecticut, C. C. Coffin excavated a coastal Algonkian shell midden near Milford and Gordon H. Rowe investigated a historic period site, particularly rich in ceramic remains, at Juniper Point in Brantford.

The Archaeological Society of Connecticut organized a project for studying the mineralogy and technology of chipped-stone artifacts in Connecticut.

*Western North America.*—During the summer months Dr. Helge Larsen of the American Museum of Natural History excavated artifacts and skeletal material from ancient Aleut sites in the Aleutian Islands, Alaska. The sites were large midden deposits on Amaknak Island (Dutch Harbor) some of which contain the earliest archaeological remains and physical types known in the southern Alaskan area.

A survey of pictographic and petroglyphic material in eastern Washington was undertaken by H. Thomas Cain and Arden R. King for the University of Washington. The area particularly studied was the central and upper Columbia valley and its tributaries. An adjunct to this survey was the mapping of all archaeological sites discovered. A large pit-house site was found in the Columbia valley 12 mi. north of Grand Coulee dam. Attempts were made to correlate archaeological sites with the locations of protohistoric villages.

A particularly interesting prehistoric site between Sunland and San Fernando, Calif., was excavated under the direction of Edwin F. Walker for the Southwest museum. This site appeared to be indicative of some prehistoric ritual comparable to the Mourning ceremony of some of the historic Indian tribes of California. The archaeological remains consisted of a deposit about 38 ft. long, 14 ft. wide, and 6 to 32 in. deep, containing fragments of stone bowls; mortars; pestles; cairn-like piles of manos, broken stones and boulders; stone knives; tobacco pipes of soapstone; arrow and spearheads; bone awls, gaming-pieces of bone; beads of olivella and abalone shell; soapstone beads; bone barbs for harpoon heads; gorgets; hammerstones; clusters of human skull fragments; fragments of cremated human bones; red, white and yellow paints; and Hohokam pottery from Arizona. The red on brown Hohokam pottery made in Arizona during the 7th, 8th, or 9th centuries after Christ serves to date the California deposit.

The Southwest museum sponsored a three-months' field season at the Borax Lake site in California. The excavations under the direction of Dr. M. R. Harrington produced some 1,700 specimens from a trench 70 ft. long, 6 ft. wide, and 6 to 10 ft. deep. Previous excavations at this site yielded Folsom points. Folsom artifacts discovered by Dr. Harrington include a Folsom point base found at a depth of 25 in., an unfinished Folsom point at a depth of 48 in., and a Folsom uniface flake knife at a depth of 77 in.

In general the finds most closely resembled those of Lake Mohave, although there were a number of scrapers, groovers and other artifacts that were equally suggestive of both Folsom and Lake Mohave types.

The Santa Barbara Museum of Natural History with the co-operation of the United States navy and the coast guard made an aerial survey of the Channel Islands off the coast of southern California. All of the Indian sites, both new as well as those recorded previously, were mapped.

In the course of three field trips to San Nicolas Island, the least known and most remote of the group, some 53 Indian village sites were visited. Collections were made from a number of these sites.

Evidence was found which indicated that the first Indian occupancy of San Nicolas Island was earlier than generally believed, although the cul-

LOWEST OF SIX successive building layers excavated at Tell Hassuna, northern Mesopotamia. Remains at this level were said to form the earliest trace of settled community life yet unearthed

ture change from oldest sites to most recent was not as obvious as that usually found on the mainland.

Some other characteristics which differentiate Nicoloño culture from that of the mainland or of other islands were the numerous remains of dogs of two or three varieties; a unique style of shell fishhook, found in large quantities; a number of diagnostic tools and ornaments made of bone; the scarcity of artifacts made of steatite; and the lack of shell ornaments.

Dr. Emil W. Haury of the department of anthropology of the University of Arizona and E. B. Sayles, curator of the Arizona State museum made an archaeological reconnaissance of the comparatively unknown and inaccessible area in the eastern part of the San Carlos Indian reservations south of the White mountains. Very few archaeologists had ever seen this part of Arizona.

In six weeks the expedition surveyed an area of about 700 sq. mi. Nearly 200 ruins were recorded and numerous samplings of potsherds were collected for later analysis.

The ruins ranged in type from pit houses to pueblos of several hundred rooms. Also there was at least one Hohokam ball court and a number of ancient agricultural fields on the slopes and ridges. These hillside fields had rows of rocks along the contours of the slopes, thus enabling maximum use of rain by slowly spreading it over the fields. Canal irrigation cultivation in the prairie areas seems to have been lacking.

The pottery types represented by the sherd collections indicated a long ceramic development—part of a cultural history—of perhaps 1,000 years ending at about A.D. 1400.

Cultural remains showed that the area was inhabited by Mogollon, Anasazi (Basketmaker-Pueblo) and Hohokam peoples.

These findings were extremely important. Future work in this area offered the probability of examining in detail the relative stages of development of three principal southwestern cultures—Mogollon, Anasazi and Hohokam. The department of anthropology of the University of Arizona and the Arizona State museum planned to inaugurate a 10- to 15-year research program in this area.

*Middle America.*—Continuing his investigations in Mexico for the Smithsonian institution and the National Geographic society, Dr. Matthew Stirling was in the field from the middle of February to the first of June 1945. Reconnaissance near Tapachula, Chiapas, revealed some new sites with interesting carved monuments.

The principal excavations were undertaken at Piedra Parada near the village of Ocozocuatla. The site consisted of a group of eight major mounds, the most interesting of which was a complex structure of superimposed pyramids of stone masonry. The primary pyramid possessed some unique architectural features. The exterior was decorated with a series of pseudo windows over which were awning-like forms of stone. In the centre of this structure there was a masonry-lined shaft with a stairway leading from the top to the bottom of the mound.

The other mounds at this site were built of earth. The group was expected to constitute the type site for this heretofore archaeologically unknown area. Ceramic materials excavated from the mound and a couple of nearby burial sites might reveal stratigraphy.

Exploration of a number of cave sites in the region produced pottery related to that of the mound site and to early Gulf Coast wares—polished black incised ware with red paint in the incisions, black bowls with over-fired rims, and negative painted pottery. A polished red ware found in considerable quantity was somewhat similar to that of the Colima region. One Colima-like dog effigy, that was cream-colored instead of red, was found.

These cave sites contained pottery in fabulous quantities. Outstanding examples were two caves, each of which contained 3,000 to 4,000 whole

vessels, but only 50 from each site could be transported.

Examination of a newly discovered site on the Rio Chiquito (a tributary of the Coatzacoalcas) in southern Vera Cruz revealed remains that equal or even surpass those of the famous La Venta site. The new site, longer than La Venta, contains an unknown number of mound constructions and stone monuments. Monuments observed during a brief survey included a stone figure of the Olmec tiger god with a human body and a head in the classic Olmec style; a stone figure of a seated woman holding a cylindrical bar on her lap; a seated woman of stone holding in her arms an infant with a human body and the head of a jaguar; and two tremendous stone heads bigger than any at La Venta and superior in execution. A stone aqueduct seen by the expedition was made of hollowed-out troughs of basalt fitted together and covered with flat slabs of the same material. There was also a large stone ball like those found in Costa Rica. The preliminary data suggest that this was a major Olmec site.

The Instituto Nacional de Antropología de México continued its numerous and varied investigations. After several years as rector of the National university, Dr. Alfonso Caso returned to his archaeological work with the institute. Early in the year he conducted excavations at the field school at Oaxaca. Dr. Caso planned to excavate a probable Olmec site near Minatitlán. An excellent human figure of stone found at this site was sculptured in the Olmec tradition.

Dr. Ruben de la Borbolla journeyed to La Venta to prepare plans for moving the La Venta monuments to Mexico City. The site at La Venta had become an oil field and the monuments might be damaged if allowed to remain there. Removal of the monuments to Mexico City was being financed by Petroleos Mexicanos.

The Instituto Nacional de Antropología continued explorations at Xochicalco in Morelos and at Monte Alban in Oaxaca.

The program at Monte Alban included restoration of part of the site, excavation of two mounds in the southern part of the main plaza, and the excavation of Mound X which contains an excellently preserved temple. The work was under the direction of Alfonso Ortega Martínez, Jorge R. Acosta and Hugo M. Koerr.

Additional plans called for an archaeological survey of the Oaxaca valley by Martínez and Acosta and for exploration of Mixtec tombs at the site of Coaixtlahuaca in the state of Oaxaca. Coaixtlahuaca is the site of a famous pre-conquest city and is believed to have been especially noted for fine work in gold and jade.

A six-months' survey of the coast of Tamaulipas was begun in the late autumn by Richard MacNeish of the department of anthropology of the University of Chicago. This part of northern Mexico is archaeologically unknown and might be important in the solution of such problems as the relationship between cultures of the southeastern United States and Mexico, and the northern boundaries of Mexican cultures.

Investigations in Yucatan and Honduras by members of the staff of the Carnegie institution were discontinued because of World War II. In Guatemala, however, some interesting salvage operations were undertaken by R. E. Smith of the Carnegie staff. Excavations in a midden exposed by a roadcut produced a large collection of potsherds. These belonged to a fine incised ware with beautiful designs incorporating human and animal figures.

During the winter A. L. Smith and C. Tejeda surveyed the northwestern highlands of Guatemala in search of sites believed to have been occupied at the time of the Spanish conquest or shortly before.

Tests of the sites and architectural studies were made at Zaculeu, Aguacatan and near Sacapulas. Some buildings were found to be in an excellent state of preservation.

**South America.**—Dr. Cornelius Osgood of Yale university prepared a summary of the archaeology of British Guiana based upon his survey of the region in Sept. 1944. The culture represented in sites near the Avuka river in the northwestern part of the area was similar to that of the Barrancas region of the lower Orinoco valley of Venezuela. A different culture was found in sites on the Demerara coast. These coastal sites contained pottery decorated by rough incising and appliqué techniques.

A report of Dr. Osgood's survey of the principal South American museums with anthropological collections appeared in *Acta Americana* for 1945.

In Venezuela Walter Dupouy, director of the Museo de Ciencias Naturales in Caracas, excavated an archaeological site near Puerto Cabello.

A burial cave in Jamaica was explored for the Institute of Jamaica by C. B. Lewis.

Dr. Alfred Métraux made an archaeological survey and collected specimens for the Smithsonian institution.

An archaeological survey of sites in the vicinity of Port-au-Prince was undertaken by Dr. Kurt Fisher of the Bureau D'Ethnologie of Haiti.

Dr. Wendell C. Bennett of Yale university continued preparation of a report of his surveys and excavations in Ecuador, undertaken in the summer and autumn of 1944. A number of mound groups in the Ibarra region were examined and artifacts were collected from the surfaces of some of these sites. The mounds were round, square or oval, and generally were made of heaped-up earth and stone. Some of the mounds had ramps.

In the Cuenca basin (province of Azuay) of the southern Ecuadorian highlands, there were 18 sites examined and 10 of these were excavated. Five of the excavated sites yielded pottery of the Cerro Narrio styles. Associated with these styles were some new wares: decorated, polished black; decorated, polished brown; and incised ware. These sites were related to those at Cañar (previously reported upon) but have greater temporal depth and show more local variation.

Other Azuay sites contained simple thick wares which showed certain Incaic influences.

**BIBLIOGRAPHY.**—"Notes and News," *American Antiquity*, vol. 11, no. 2 (Oct. 1945, pp. 133-139). (G. I. Q.)

**Archery.** In February the 18th annual Olympic Bowmen league contest between teams representing different archery clubs was held (indoor shooting at 30 yards), with 454

participating. The winners in this event were the men's team representing the Akron Archers of Akron, O., and the women's team representing the Cleveland Archery club of Cleveland, O.

The 16th annual women's intercollegiate archery contest between teams representing colleges having women students (about 500 participating) was held in May, as was the sixth interscholastic competition between teams representing high schools or secondary schools. The intercollegiate event was won by the University of Connecticut, Storrs, Conn., and the interscholastic event by the Bloomfield High School, Bloomfield, N.J.

In August the fourth nation-wide target shoot was held, in which 805 archers took part. W. J. Everman of New Carlisle, O., took first honours among the men, with a York round score of 138-874 and an American round score of 90-710. Top place among the women went to Mrs. S. Robert Leaman of Bird-in-Hand, Pa., with a National round score of 72-534 and a Columbia round score of 72-608. Jimmie Tandy of Richmond Heights, Mo., and Rita Dispenziere of Bloomfield, N.J., were the winners in the junior division.

In September the fourth nation-wide flight shoot took place. In the regular style event Harry Drake of Lakeside, Calif., led the men with a shot of 541 yd. 7½ in., and Mrs. Verne Trittin of Salt Lake City, Utah, took first place among the women with a shot of 470 yd. 3 in. Frank Drake of Tacoma, Wash., won in the junior division with a shot of 372 yd. 9 in. In the free style event Mike Humbert of Springboro, O., shot an arrow 593 yd. 2 ft. 8 in.

The National Field Archery association, which specializes in field archery, held a series of tournaments by mail. (L. C. S.)

**Architecture.** The end of World War II brought to architecture extensive planning and preparation of designs, but the few months of peace in 1945 brought little actual building. The effects of the global strife were too great to permit the immediate return to normalcy in architectural practice.

Material and manpower shortages, combined with a considerable rise in construction costs, delayed the execution of most projects. The accumulation of blueprints prepared in the war years as an aid to re-employment during demobilization remained temporarily unused. While building activity in the U.S. and the neutral countries was delayed only by the knotty problems of reconversion to a peacetime activity, the warring countries of Europe and the orient suffered from so large a destruction and disruption that all building other than that of an emergency nature remained at a standstill.

The great immediate need for housing throughout the world, and the urgency to make essential repairs to create bearable conditions of life in the war-torn countries tied down a large portion of the skilled personnel in architecture and construction.

Architectural accomplishment and changes in the character of design could only be evaluated in the plans, perspectives and models for projects that awaited execution. By and large, architectural thought aligned itself with the various concepts established before the war. While a great many designs still appeared in traditional forms due to the momentum behind the old established doctrines, modern architecture became recognized as the only logical means of expression for buildings that were to be in keeping with the times. A general progress in architecture was stimulated by the growth of science and technology, but the varied forms of architectural expression still reflected the diverse social and economic concepts confronting the world. Countries with differing social philosophies produced architectural designs of varied character, and even within nations where freedom of expression was practised architecture found simultaneously a reactionary or progressive expression.

Above: OUTDOOR SCHOOL HOUSE designed by Richard J. Neutra as part of a huge building project under way in Puerto Rico during 1945. The rooms are oriented toward the prevailing breezes and equipped with centre-pivoted doors

Right: SCALE MODEL for one of 5 hospitals designed by Richard J. Neutra for the Puerto Rican building program being carried out in 1945. Plans also included more than 250 schools and 128 rural health centres for preventive medicine

Below: MODEL of the proposed Solomon R. Guggenheim Museum of Non-Objective Painting in New York city, as revealed by designer Frank Lloyd Wright on July 9, 1945. The poured concrete structure was to consist mainly of a continuous spiral ramp, graded at 3 1/2 in. to 20 ft., and topped by a glass dome

Bottom: VIEW of model of the proposed national stadium in Brazil, designed by Oscar Niemeyer Soares

The process of decentralization, which at the beginning of World War II had already manifested itself in a flight from crowded urban centres, became accentuated as a result of aerial bombardment. Architects and town planners were mindful of the need of more open spaces between buildings and a reduced density of population in the cores of cities and towns. Among the types of buildings planned, and in part undergoing construction, housing was most prominent. Medical institutions, airports for civil aviation, schools and public buildings were also in great demand.

**Design and Planning.**—The modern approach to architectural design was well established. The use of classic motives and the following of eclectic styles had disappeared in most cases. Classic proportions and the rigid rules of symmetry played a minor role in architectural thinking. There existed a sounder regard for the expression of the function of buildings in their design. In the arrangement of building plans flexibility, permitting adjustment to changing conditions, was stressed. Modern architecture was characterized by an abundant use of glass and a greater stressing of the horizontal lines in the arrangement of fenestrations and building masses. Buildings were designed for the stimulation and enjoyment of their occupants rather than for ostentation.

In residential design, living rooms were merged with the out-of-doors through walls of glass. Dining kitchens appeared frequently to make meal preparation more efficient and serving easier. Rooms served multiple purposes. Bedrooms at times doubled as living rooms. Separate dining rooms and libraries became infrequent. Laundries and kitchens were combined. The public demand centred about houses that were easy to operate under the shortage of servants; that reduced house-cleaning problems and at the same time offered greater comfort. Storage spaces were carefully designed with special provisions for the variety of equipment to be stored. Housing for the masses of the population demanding shelter required of designers skill in reducing costs and in prescribing a technique of building permitting rapid execution. Governments concerned themselves with the establishment of agencies dealing with urban redevelopment, with public and private low-rent urban and rural housing and with research in the building industry and in the financing of low-rent housing.

The design of school buildings reflected a progress in educational methods. School plants became larger and more diversified in the types of rooms provided to allow for the development of the "whole child" in mind, body and character. Health clinics, larger athletic facilities, and increase in the space assigned to libraries, shops and special rooms became noticeable. More schools were planned as single or two-story structures in a less permanent construction than as a multiple-story indestructible plant. The sites for schools became larger to provide for greater play areas.

To industrial building the war brought considerable progress. Workers' colonies in the neighbourhood of factories were provided and the workers' comfort in the plant received greater consideration. Recreation rooms, more spacious locker rooms and attractive cafeterias were provided. Windowless plants lost in popularity from the psychological objections that arose in the minds of the workers and the absence of a further need for blackouts. More industrial buildings were designed as semi-daylight plants, which provided windows merely for the contact with the out-of-doors but relied on artificial illumination to give the great amount of light needed for modern production methods. Commercial buildings were influenced in their design by the ever-increasing need for a greater flexibility. Office buildings, with fewer internal columns and floors spanning up to 60 feet, appeared. Stores became devoid of masonry obstructions at

their show windows, and in an increasing number of cases the entire shop was displayed to the passer-by rather than merely the show window. Medical institutions demanded large hospitals for the treatment of the war casualties. The need for a great rapidity in construction and safety from fire favoured one-story pavilion-type plans. In theatre design a trend toward smaller auditoriums was noticeable. The motion-picture industry envisaged prefabricated small theatres that could be produced in the United States and shipped to the various parts of the world.

**Materials and Methods.**—The construction methods used depended to the largest extent on the kinds of materials that were available, which were greatly affected by governmental limitations and new products grown out of the wartime conditions. Lumber became a material that was difficult to obtain. Wood was used with greater efficiency through the development of laminated construction, that is, layers of wood glued together for timber arches and plywood trusses. Great advance was made in the development of adhesives—phenol and urea resin glues—which permitted the bonding of wood to wood and wood to metals or other materials. New impregnated woods appeared which provided greater stability and, with certain forms of impregnation, fireproofness. Concrete was more frequently used; often movable forms were applied to reduce the material consumed in them and to increase the speed of construction. Thin concrete shells were often employed. Reinforced concrete was prestressed in some applications to save on steel and concrete. Prefabricated steel panels for both houses and industrial buildings were developed which proved to be better adapted to large-scale manufacture than either wood or concrete. For small-house construction site fabrication of building parts along the assembly-line methods was employed. A trend toward baseless houses manifested itself and a vast amount of experimentation resulted in improved methods of small-house foundation design.

In masonry construction the simplification of the sizes of the units of the material were an important development. In the United States a four-inch module was established as a basic unit of measure which was applied to permit a better integration in the dimensioning of the walls, windows and doors.

Plastics came into their own with an ever-increasing variety of materials and methods becoming available for building use.

Radiant heating, its advantages and its problems, became more fully recognized in the United States. Hot-air systems were added to the more common hot-water method of heating the floors, walls or ceilings of buildings. The mechanical core of the house which provides the installations for the kitchen, bathroom and house heating was manufactured as a single-packaged unit.

**Examples of 1945 Architecture.**—In the United States the attention of the government was focused on a housing bill drafted to provide for the consolidation of all government housing functions, to facilitate research in the building industry, and to provide for urban redevelopment and private and public low-rent housing for urban and rural areas. Insurance companies financed housing construction; the Metropolitan Life Insurance company through a series of contemplated projects might ultimately become landlord to 80,000 New Yorkers. The newspapers of New York city carried advertisements offering complete prefabricated houses for sale by department stores.

Many industrial concerns planned new research facilities. General Motors proposed to erect a "City of Science and Art," designed by Saarinen and Swanson, architects, for the purposes of improving their products and to explore the opportunities for serving human needs and aspirations in the postwar world.

Remarkable rapidity of construction was accomplished prior

to the end of World War II in the construction of industrial plants and housing facilities for the work on the atomic bomb. "Atom City" at Oak Ridge, Tenn., grew from virgin land to a bustling community of 75,000 within two years.

The architect, Frank Lloyd Wright, displayed a model for a building to house Solomon Guggenheim's collection of non-objective paintings in New York city. It proposed the use of a novel plan for museums in which a spiral ramp would act as the exhibition gallery.

A master plan for the rebuilding of the city of Toledo was displayed in the form of an elaborate model designed by Norman Bel Geddes. The exhibit followed in its aim the efforts of many a U.S. city to arouse public interest in the need for urban rehabilitation and to show the people who constitute the city the opportunities toward a better living that grow from civic improvements.

Private building enterprise and public effort in Great Britain joined in an effective working partnership to meet the urgent housing needs. The new Labour government viewed the temporary housing construction with considerable disfavour, and its future policy was being planned to concentrate all energies on permanent housing. In France the architect Le Corbusier (pseudonym of Charles Édouard Jeanneret) was chosen by the ministry of reconstruction to serve on a supreme council of city planning in the guiding of public works. His plan for the rebuilding of St. Die was given official approval.

Examples of Swedish architecture were featured in architectural publications as architectural work which remained reasonably unaffected by the war compared with other European countries. A new entertainment centre at Malmö combined the functions of a theatre, opera house and concert hall in a single ingeniously equipped structure.

Switzerland, like Sweden, appeared after five years of cultural estrangement and complete encirclement by warring nations with examples of modern architecture which continued to interest architectural thinking.

Brazil developed a contemporary architecture peculiarly suited to its local climate and customs and thus was included among the nations leading in architectural progress. (See also BUILDING AND CONSTRUCTION INDUSTRY.)

**Archives, National.** Established in 1934, the National Archives preserves and services the non-current records of the United States government that have administrative, legal, research, or other value in order that the recorded experience of the nation may be available to the government and the people for use in conducting their affairs.

By Dec. 31, 1945, the National Archives had in its custody more than 700,000 cu.ft. of records ranging in date from the Revolutionary War through World War II. Among them were about 400,000 maps and charts, 7,500,000 running feet of motion-picture film, 100,000 sound recordings and 1,200,000

photographic items. These records were received from congress, the White House, every executive department, most of the independent agencies, and several of the federal courts. They shed light on almost every aspect of the political, economic, social and institutional development of the United States.

Subject to a few necessary restrictions, materials in the National Archives may be consulted by anyone with a legitimate reason for using them. The central search rooms are open every day except Sunday. Records are also made available to the public through exhibits and publications. The German and Japanese surrender documents were among the records being exhibited at the end of 1945 and they were to remain on display indefinitely. Facsimiles of these surrender papers were published in 1945 in *Germany Surrenders Unconditionally* and *The End of the War in the Pacific*, and a brief guide to all the records in the archivist's custody, entitled *Your Government's Records in the National Archives*, was in press at the end of the year.

Current government regulations that have general applicability and legal effect are published by the National Archives in the *Federal Register*. The archivist of the United States also administers the Franklin D. Roosevelt library at Hyde Park, N.Y., which houses the papers and collections of the former president.

## Areas and Populations of the Countries of the World.

The table that follows gives the area, population and population per square mile for the various countries of the world. For many countries it was difficult under conditions of 1945 to secure population data which were entirely satisfactory.

The latest available figures relate to different dates in different countries; and in some cases different dates connote different areas.

The table gives figures for practically the entire world, however, with a minimum of overlap or similar complication and with a sufficient degree of accuracy to serve as a source of general information with respect to the relative importance of the several countries.

Areas and Populations of the Countries of the World

Name of Continent and State	Area (in Square Miles)	Population (000's omitted)	Population per Square Mile
World total . . . . .	51,461,741	2,229,858	43.3
Africa . . . . .	11,704,284	167,183	14.3
Belgian colonies and mandates . . . . .	923,202	14,400	15.6
British colonies, dependencies, and mandates . . . . .	3,335,573	53,817	16.1
Egypt . . . . .	386,100	17,423	45.1
Ethiopia (Abyssinia) . . . . .	347,490	9,300	26.8
French colonies and mandates . . . . .	4,264,335	44,700	10.5
Italian colonies . . . . .	998,108	3,580	3.6
Liberia . . . . .	46,332	2,500	54.0
Portuguese colonies . . . . .	801,653	9,418	11.7
Spanish colonies and dependencies . . . . .	128,654	1,076	8.4
Tangier . . . . .	232	80	344.8
Union of South Africa . . . . .	472,605	10,889	23.0
Asia (excl. of U.S.S.R.) . . . . .	10,533,080	1,179,061	111.9
Aegean Islands (Italy) . . . . .	1,043	122	117.0
Afghanistan . . . . .	250,965	7,000	27.9
Arabia . . . . .	1,004,131	7,120	7.1
Bhutan . . . . .	19,305	250	13.0
British colonies, dependencies, and mandates . . . . .	202,000	16,136	79.9
Burma (Great Britain) . . . . .	233,591	16,824	72.0
China and dependencies (incl. Formosa) . . . . .	4,494,892	471,179	104.8
French colonies . . . . .	286,227	24,274	84.8
India . . . . .	1,581,410	388,998	246.0
Iran (Persia) . . . . .	634,362	15,000	23.6
Iraq . . . . .	116,602	3,700	31.7
Japan (proper) . . . . .	147,490	73,114	495.7
Korea . . . . .	85,331	24,326	285.1
Nepal . . . . .	54,054	5,600	103.6
Netherlands Indies . . . . .	735,164	71,534	97.3
Philippines (U.S.) . . . . .	114,290	16,711	146.2
Portuguese colonies . . . . .	8,888	1,455	163.7
Siam (Thailand) . . . . .	200,000	15,718	78.6
Syria and Lebanon . . . . .	76,065	3,700	48.6
Turkey (in Asia) . . . . .	287,270	16,300	56.7

Areas and Populations of the Countries of the World (Continued)

Name of Continent and State	Area (in Square Miles)	Population (000's omitted)	Population per Square Mile
Europe (excl. of U.S.S.R.) . . . . .	1,934,053	387,389	200.3
Albania . . . . .	10,811	1,106	102.3

(L. E. T.)

**Argentina.** A federal republic in southeastern South America, the second largest on the continent. Area, 1,079,965 sq.mi.; pop. (Dec. 31, 1944 est.), 14,130,871. The population is estimated to be 97% of European (mostly Spanish and Italian) descent. The total of foreign-born population in 1940 was 2,355,900. The capital is Buenos Aires (pop., Dec. 31, 1944 est., 2,485,355), the continent's largest city and Argentina's most important port. Other important cities, with official pop. ests. (March, 1944), are Rosario (521,210); Avellaneda (399,021); Córdoba (339,375); La Plata (256,378); Tucumán

(169,566); Santa Fé (149,926); Bahía Blanca (121,055); Mendoza (100,429); Lomas de Zamora (100,000). Under the constitution of 1853 (the oldest in any Latin-American state) Argentina includes 14 provinces and 9 territories. Although many constitutional features were in abeyance in 1945, the president is nominally elected indirectly for a six-year term and the bicameral congress includes a senate of 30 and a chamber of deputies of 158. President in 1945: Edelmiro Farrell.

**History.**—Argentina continued to be a storm centre in 1945, the principal developments involving the failure to be invited to attend the Inter-American Conference on Problems of War and Peace (*q.v.*) at Mexico City in February-March; the subsequent endorsement of the principles of the Act of Chapultepec and the Argentine declaration of war against the axis; the mounting political crisis; and the temporary ouster of Vice-Pres. Perón in October and his re-entrenchment in power a few days later.

Argentina's request on Oct. 26, 1944, for a special conference of American foreign ministers to consider the inter-American attitude toward Argentina had been a startling and embarrassing diplomatic development. After prolonged discussions in various capitals, the governing board of the Pan American Union voted on Jan. 7, 1945, to defer the request indefinitely in view of the previous decision to hold a special conference on war and postwar problems. The United States state department simultaneously announced plans for such a conference at Mexico City in February. As a consequence, Argentina withdrew its representation from the governing board of the Pan American Union for the time being. The conference at Mexico City, meeting Feb. 21-March 8, 1945, consciously subordinated the Argentine question to more general problems and placed it at the end of the agenda. Decisions as they involved Argentina provided in essence for extending an opportunity to Argentina to adhere to the steps taken at Mexico City; and, if Argentina consequently declared war on the axis, signed the United Nations pact and took other steps to demonstrate hemispheric accord, the understanding was that Argentina would be readmitted to the community of American states, presumably prior to the meeting of the United Nations Conference on International Organization (*q.v.*) at San Francisco in April 1945. Argentina resumed its seat on the Pan American Union on March 12 after an absence of two months. Pres. Farrell announced on March 27 that war had been declared against the axis powers in order to "identify the policy of the Nation with that of the other American republics." This was promptly followed by a request by Argentina to sign the Act of Chapultepec adopted at Mexico City; the act was signed at Mexico City by the Argentine chargé on April 4. The government in early April took steps to round up suspected axis agents in Argentina, close pro-nazi newspapers and confiscate enemy alien property. United States and other officials later expressed doubt as to the genuineness of some of these steps. The U.S. state department announced on April 9 that all American republics had agreed to resume "normal diplomatic relations" with Argentina. Pres. Truman on April 19 nominated Spruille Braden, U.S. ambassador to Cuba, as ambassador to Argentina; he was confirmed on May 7, arrived in Buenos Aires on May 20 and presented his credentials on May 21. After sharp debate in the opening days of the San Francisco conference, Argentina was admitted to membership despite continued reservations expressed by high U.S. officials about that government's actions, including a statement by Pres. Truman on June 2 that the U.S. was "not happy" over the Argentine situation. Argentina ratified the United Nations charter on Sept. 8.

Domestic politics reflected many changes in 1945. Vice-Pres. Juan D. Perón, alleged to be the dominant figure in Argentine

ARGENTINE CITIZENS, numbering an estimated 500,000, demonstrated in Buenos Aires on Sept. 19, 1945, demanding a return to constitutional democracy and the resignation of Juan D. Perón, then vice-president. The banner pictures democracy breaking the people's chains

affairs, told a meeting of industrial and financial leaders on Jan. 18 that he would not continue to endure their "sabotage of silence." The government on Jan. 29 published a detailed decree of Jan. 15, imposing very severe penalties for treason, espionage or sabotage. Increased democratic opposition began crystallizing in February and the following months were characterized by a wave of political arrests, exiles, charges and counter-charges and general unrest. Opposition leaders, concentrated principally in Montevideo, Uruguay, found it difficult to form a united front against the Farrell-Perón regime. The government on May 31 published a new party statute with various novel features including compulsory voting, a ban on "exotic ideologies," etc.; the statute subsequently aroused much criticism. Correspondent Arnaldo Cortesi published in the *New York Times* on June 1 a sensational dispatch charging dictatorial methods and corruption on the part of the government; repercussions were heard both in Argentina and elsewhere for several weeks. On June 16 a manifesto was published in Buenos Aires papers by 321 industrial and commercial organizations attacking the policies of the regime. Despite continuing disturbances, the government on Aug. 6 lifted the state of siege in effect from Dec. 16, 1941. Ambassador Braden, who, during his tenure in Buenos Aires, made several critical statements about the government, was promoted to the position of assistant secretary of state on Aug. 25, implying a more severe U.S. policy toward Argentina; he left Buenos Aires on Sept. 23.

Gen. Arturo Rawson, president of Argentina for two days in 1943, was arrested on Sept. 25 for alleged leadership of an attempted revolution. The government restored the state of siege on Sept. 26. Civilian leaders expressed little faith in Pres. Farrell's earlier announcement that elections would be held before the end of 1945. A coup led by Gen. Eduardo J. Avalos and Adm. Hector Vernengo Lima ousted Vice-Pres. Perón from his various posts on Oct. 9 and forced considerable governmental reorganization; Pres. Farrell remained in office. Perón on Oct. 17 succeeded in returning to power (though not to office) with the mass support of certain labour elements which had been backing him for the presidency. The government on Nov. 14 set Feb. 24, 1946, as the date for elections and in the

meantime Perón made his long-delayed formal announcement of candidacy.

**Education and Religion.**—Enrolment in 1943 was reported at 1,928,343 in 13,968 primary schools; 135,456 in 718 intermediate schools; and 37,586 in 6 universities. The literacy rate was 85%. Universities continued in 1945 to be centres of protest against the policies of the government. In religion Argentina is predominantly Roman Catholic; the attitude of the military government had been to establish closer relations with the Church. A pastoral letter issued on Jan. 26 by the cardinal primate and the archbishops condemned activities of Protestant denominations in Argentina. Giacomo Luigi Cardinal Copello on Feb. 15, 1945, attacked the "foreign influence" of motion pictures and books that "weaken the solidarity of the home." Pope Pius XII on Dec. 23 appointed a second cardinal for Argentina, Antonio Gaggiano, archbishop of Rosario.

**Finance.**—The monetary unit is the peso, valued in Dec. 1945 at from 23.64 to 26.81 cents (U.S.). The ordinary budget for 1945 balanced at 1,413,335,000 pesos (1944: 1,351,080,000). Ordinary revenues for 1945 were estimated late in the year at 1,370,300,000 pesos, and the deficit for the year, it was estimated, would reach 207,000,000 pesos; actual ordinary revenues for the first eight months of 1945 were 1,031,000,000 pesos (same period in 1944: 838,000,000). The government struggled with continued inflation in 1945; the cost-of-living index in September was 133.5 as against 100 in 1939 and 109.6 in September 1944. The national internal debt (excluding floating debt) June 30, 1945, was 8,941,000,000 pesos; at the same date in previous years it was: 1944, 7,673,000,000; 1943, 6,279,000,000; 1942, 4,880,000,000; 1941, 3,845,000,000. The external debt June 30, 1945, was 11,100,000 pesos in pounds; 144,300,000 pesos in dollars; and 83,400,000 pesos in Swiss francs. A new private issue of 1945-85 internal credit bonds totalling 500,000,000 pesos was authorized on Aug. 14 to cover the government's contribution to pension funds. The government in July announced plans for a large housing program, involving expenditure of 200,000,000 pesos annually for 20 years, at a cost of 7,000-10,000 pesos a house, to complement its slum-clearance program. A five-year plan of public works was decreed early in 1945 at a cost of 1,250,000,000 pesos as an unemployment-relief measure. Financial measures taken after the declaration of war included the blocking of axis cash accounts,

bonds and safety deposits and the setting up of control measures for their release. The stock exchange turnover in 1944 totalled 2,837,100,000 pesos (1943: 1,155,600,000). The share market was generally strong in 1944 and 1945 but was sensitive to war news. Gold and exchange holdings of the Central bank and commercial banks on Jan. 1, 1945, totalled 4,779,400,000 pesos, an increase of 1,013,000,000 pesos in one year. Buenos Aires real estate sales increased 25.6% in 1944 over 1943.

**Trade and Communications.**—Foreign trade in 1944 was characterized, as in 1943, by low-volume imports and low-quantity but high-value exports. Imports for 1944 were valued at 1,007,154,000 pesos, an increase of 6.9% in value and 7.0% in volume over 1943. Exports totalled 2,352,881,000 pesos, an increase in value of 7.3% and in volume of 15.3% over 1943. The record favourable balance in 1944 was 1,345,727,000 pesos. Meat exports constituted about one-eighth of the tonnage but about one-third of the value of all 1944 exports. The leading customers, in order, in 1944 were: United Kingdom, 871,200,000 pesos; United States, 521,300,000; Brazil, 219,800,000; the leading suppliers were: Brazil, 344,000,000 pesos; United States, 151,900,000; United Kingdom, 80,400,000. Other chief destinations of exports were, in order: Sweden, Spain, South Africa, Peru and Switzerland; other chief sources of imports were Sweden, India, Chile, Switzerland and Spain. Exports for the first nine months of 1945 were valued at 1,737,200,000 pesos (same period in 1944: 1,760,300,000 pesos) with a metric tonnage of 4,895,000 (same period in 1944: 4,676,000 metric tons). Imports for the first eight months of 1945 were valued at 693,800,000 pesos (same period in 1944: 653,000,000 pesos) with a tonnage of 2,575,000 (same period in 1944: 2,539,000 metric tons). The U.S. and Argentina concluded an agreement on May 9 for a large-scale purchase by the U.S. of linseed and vegetable oils in return for the supply of large quantities of fuel oils to supplement inadequate Argentine fuel resources. Argentina on Aug. 4 announced consummation of a trade pact with Sweden. The government late in 1945 gave notice of intention to end the Anglo-Argentine trade and exchange agreement of 1936, effective Feb. 21, 1946. Domestic trade was prosperous in 1944 and the early months of 1945. Argentine equip-

ment requirements for new plant capacity and replacements during the first 10 years after the war were estimated by U.S. officials in 1945 at \$1,167,000,000, of which they estimated \$645,000,000 would be supplied from the U.S.

Highway and railway mileages were estimated respectively at 253,115 and 28,775. An agreement with Bolivia was announced in June, aimed at extension of the railway between Yacuiba and Santa Cruz, Bolivia, and the construction of further highways to tap Bolivian oil fields; funds were to be provided by Argentina. Plans also were announced for highway construction in Entre Ríos and Corrientes provinces at a cost of 25,400,000 pesos to connect with the new international bridge over the Uruguay river. Air services continued to expand in 1945, the chief development being the commencement of work on a new Buenos Aires airport at a cost of \$8,000,000. Passenger and mail-plane service to Tierra del Fuego began. Argentina fell in line with other countries of the hemisphere in decreeing on June 10 that highway traffic should thereafter drive on the right side of the road. Cargo carried over Argentine railways in the first three months of the 1944-45 fiscal year totalled 14,566,000 tons (an increase of 9.3% over the same period in 1943-44); passengers totalled 58,752,000 (an increase of 17.2%), and revenues totalled 138,170,028 pesos (as against 103,478,861 pesos in the same period of 1943-44). In the first six months of the 1944-45 fiscal year traffic receipts of private railways gained 16.9% and those of state railways 9.1% as compared with the same period of the preceding year. Argentine arrivals of sea-going vessels in 1944 totalled 1,485 with a tonnage of 3,324,407 as against 1,334 ships with a tonnage of 2,765,393 in 1943. Plans were being considered late in 1945 for a new three-kilometre tunnel through the Andes to Chile to carry railway and Pan American highway traffic. The number of telephone exchanges Jan. 1, 1945, was 753 and the number of instruments was 493,055.

**Agriculture.**—Crop estimates for 1944-45, in metric tons, included: cotton, 72,300; sugar cane, 5,634,700; corn, 2,965,500; sunflower seed, 985,100; peanuts, 158,250; tobacco, 18,160; flaxseed, 841,500; tung oil, 2,100; grapes, 200,100; apples, 139,900; peaches, 128,700; pears, 118,000; wheat, 4,085,300; oats, 1,098,700; barley, 572,800; rye, 189,400. Slaughter of livestock in the first six months of 1945 included: cattle, 1,589,000; sheep, 3,987,000; hogs, 1,540,000. The hog population July 1, 1945, was estimated at 8,010,000 and the cattle population at 34,010,300; the number of cattle July 1, 1942, was estimated at 31,459,500. Grain shipments to Great Britain were being postponed by September because of the need to conserve the grain for use as fuel due to acute fuel shortages. A severe summer drought in January imperilled crop and livestock prospects. *La Prensa*, a leading Buenos Aires paper, late in January termed the crop situation an "agricultural disaster."

**Manufacturing and Mining.**—Industrial expansion in 1944 was accelerated by a shortage of imports. The same trend continued in 1945, aided by a government program to make Argentina economically self-sufficient. Industrial wages in the first eight months of 1945 were 9.9% above the same period in 1944; the index (on a basis of 1937=100) was 182.2. The important meat-packing industry was seriously hampered for many weeks beginning in April by a strike affecting almost 100,000 employees. The government in mid-year reported that at least 100,000 girls under 20 years were employed in manufacturing.

Petroleum production in the first six months of 1945 was 1,839,401 cubic metres; in all of 1944 it was 3,852,088; and in 1943, 3,948,412 cubic metres. Production is usually about two-thirds from state oil fields by the YPF (government petroleum agency) and one-third from private fields. The rank of metals in 1944, by value of production, was: tungsten, lead, gold, zinc,

"THE MYSTERIOUS STRANGER" was the term applied to Argentina's presence among the United Nations in 1945 by Daniel Bishop of the *St. Louis Star-Times*

THE DILIGENT QUINTUPLETS (left to right: Franco, Maria Fernanda, Maria Christina, Maria Ester, Carlos Alberto) at the celebration of their second birthday in Buenos Aires, in July 1945

tin, silver. The government was making plans early in 1945 to develop supposedly rich sulphur deposits in Los Andes province at a height of 16,700 ft. (See also FASCISM.)

**Argentinita** (ENCARNACIÓN LOPEZ) (1905-1945), Spanish dancer, was born March 25 in Buenos Aires and went with her Castilian parents to Spain, where she studied dancing and became an interpreter of classical Spanish dances. At her first appearance, a critical Spanish audience thoroughly endorsed her technique. Soon Argentinita—the little Argentinian—became famous throughout Spain for her flawless footwork and castanet playing as well as for the excellence of her pantomime. In 1930, she made her debut in the United States in *The International Revue*, winning the applause of New York critics for her agile and fiery performance. In 1932, she returned to Madrid where with the late Garcia Lorca, the Spanish poet, she organized the Madrid ballet. In 1938, she toured the U.S. and Latin America. Argentinita and her ensemble appeared regularly as guest artists with the Ballet theatre in the fall and spring seasons at the Metropolitan Opera house. Her last appearance was at Carnegie hall in March 1945. She died in New York city, Sept. 24.

**Arizona.** The "Grand Canyon state" lies in the southwestern part of the United States. It borders Mexico on the south; the Colorado river forms most of the western boundary. Area 113,909 sq.mi. including 329 sq.mi. of water. Pop. (1940) 499,261, 65.2% rural and 34.8% urban. Native and foreign-born whites (including Mexicans) numbered 389,955 and 36,837 respectively; Negroes 14,993; other races (mostly Indians) 57,476. Estimated population (1944) 638,412. The capital is Phoenix with estimated (1945) population of more than 100,000; chief cities: Tucson (estimated 90,000); and (1940) Douglas (8,623); Mesa (7,224); Globe (6,141); Prescott (6,018); Bisbee (5,853); Yuma (5,325); and Flagstaff (5,080).

**History.**—The state officials in 1945 were: chief justices, Henry D. Ross (died Feb. 9) and Rawghlie C. Stanford; governor, Sidney P. Osborn; secretary of state, Dan E. Garvey; treasurer, William T. Brooks; attorney-general, John L. Sullivan; superintendent of public instruction, E. D. Ring. The regular session of the legislature met in Jan. 1945, and a special session was called by Governor Osborn in March. A measure was

passed providing for a single board of regents for the University of Arizona and the two state teachers colleges. Provision was made for a survey of the use and supply of underground water for irrigation; also provision for valuing gas and electric plants as a basis for rate-making.

**Education.**—The net enrolment for 1944-45 and the number of teachers in the public schools stood respectively as follows: elementary schools 93,058 and 2,751; high schools 22,074 and 931. In addition there were 50 private and parochial schools.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—In Oct. 1945 there were 25,165 persons receiving assistance from the state department of social security and welfare. The total appropriation to the department for 1945 was \$4,540,500. Other state appropriations for 1945: industrial school \$151,500; juvenile girl offenders \$90,000; pioneer home \$85,791; prison \$230,000; state hospital for the insane \$707,862.

**Communication.**—There was in 1945 a total of 3,824 mi. of state highway in Arizona; improved 3,661 mi., unimproved 163 mi. There were 2,208 mi. of railroads.

**Banking and Finance.**—National banks in June 1945: deposits \$246,828,310; loans and discounts \$46,125,957; U.S. government securities \$142,054,663; stocks, bonds and other securities \$2,282,311. State banks: deposits \$77,530,171; loans and discounts \$10,188,355; U.S. government securities \$51,574,739; stocks, bonds and other securities \$2,514,196.

**Agriculture.**—German prisoners of war were employed to pick cotton even after the close of World War II.

Table I.—Leading Agricultural Products of Arizona, 1945 and 1944

Crop	1945 (est.)	1944
Wheat, bu. . . . .	550,000	528,000
Oats, bu. . . . .	416,000	319,000
Sorghum grain, bu. . . . .	1,802,000	2,176,000
Corn, bu. . . . .	437,000	361,000
Cotton lint, bales . . . . .	127,000	136,000
Grapefruit, boxes . . . . .	4,500,000	3,750,000
Oranges, boxes . . . . .	1,240,000	1,150,000
Horses, head . . . . .	70,000	71,000
Cattle and calves, head . . . . .	892,000	959,000
Sheep and lambs, head . . . . .	645,000	672,000

**Manufacturing.**—Less than 10% of the population ordinarily is engaged in manufacturing. The most important industries produced food, textiles, metal and lumber; however, during World War II an aeroplane assembly plant and a Good-year plant employed several thousand, but closed with the war.

**Mineral Production.**—Owing to labour shortage the amount and value of copper for 1945 was below that of 1944, only 216,394 tons being produced the first nine months of 1945. The

Table II.—Mineral Production of Arizona, 1944

Products	Weight	Value
Copper, tons . . . . .	353,303	\$96,741,810
Gold, fine oz. . . . .	112,162	3,925,670
Silver, fine oz. . . . .	4,394,039	3,124,650
Zinc, lb. . . . .	58,154,000	6,629,556
Lead, lb. . . . .	33,414,000	2,673,120

same was true for gold and silver. Zinc and lead showed a relative increase, the nine months' production being 48,214,000 lb. and 31,406,000 lb. respectively. (H. A. H.)

**Arkansas.** Arkansas is an inland state in the south-central United States, admitted to the union in 1836. Area 53,102 sq.mi., 377 of which are normally under water.

Pop. (1940) of 1,949,387 amounted to an increase for the decade between 1930 and 1940 of 94,905, or a gain of 5.1%. The average of inhabitants to the square mile was 37 persons. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 1,776,446. There were 53 towns and cities in the state having a total population of 431,910 urban and 1,517,477 rural. The Negro population was 506,770. Capital, Little Rock (pop. 1940, 88,039). Other cities: Fort Smith

36,584; Hot Springs 21,370; Pine Bluff 21,290; North Little Rock 21,137.

**History.**—The principal state officers during 1945 were: Ben T. Laney, governor; J. L. Shaver, lieutenant governor; C. G. Hall, secretary of state; J. O. Humphrey, auditor; J. V. Clayton, treasurer; Guy E. Williams, attorney general; C. A. Rankin, land commissioner.

The chief accomplishments of the Laney administration during 1945 were a reduction in state employees and total expenses; consolidation of all natural resource agencies into one, with resulting economy and efficiency; improved finances for public schools; and a new method of allocating state revenues to vital services which largely eliminated earmarking of special tax levies and assured continuous operation of necessary service during periods of reduced revenues.

**Education.**—Total expenditures, state and local, for public schools in the school year 1944-45 were \$20,635,862. Total attendance was: white 230,490; Negro 85,252; total 315,742. Teachers totalled 12,770, of which 6,872 were white elementary, 2,135 Negro elementary, 3,283 white high school and 480 Negro high school. The commissioner of education was Ralph B. Jones.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The state in 1945 maintained 30 charitable and correctional institutions, including the state penitentiary farms, the state farm for women, girls' industrial school, boys' industrial school, Negro boys' industrial school, state hospital for nervous diseases, tuberculosis sanatoriums, school for the blind, school for the deaf, Confederate veterans' home and children's home and hospital. The legislature of 1945 appropriated \$4,770,900 for expenditure through the state welfare department in each of the fiscal years 1946 and 1947.

**Communications.**—Highways, local, state and federal, totalled about 75,000 mi. in 1945. About 7,700 mi. of the nearly 10,000 mi. on the state and federal system were surfaced with concrete, asphalt or gravel. Work was to start soon on a \$42,000,000 three-year construction program, with federal aid. Railway mileage was about 5,000 mi. Air service expanded during the year with addition of east-west and north-south service through the state crossing at Fort Smith.

**Banking and Finance.**—On June 30, 1945, there were 210 state and national banks, with total deposits of \$665,918,000.

The total bonded debt of the state on Dec. 31, 1945, was \$133,540,500. State treasury balances on Dec. 31, 1945, totalled \$47,654,685.53, of which approximately \$27,000,000 was invested in securities producing an annual income of approximately \$500,000.

**Agriculture.**—Sales of livestock and livestock products in 1945 were estimated at \$100,000,000. The value of livestock, including chickens, on farms on Jan. 1, 1945, was \$108,279,000. The latest U.S. farm census showed 206,527 farms with 17,781,582 total acres. Harvested acreage was approximately 6,300,000.

*Leading Agricultural Products of Arkansas, 1945 and 1944*

	1945	1944
Cotton, bales. . . . .	1,080,000	1,960,000
Corn, bu. . . . .	35,511,000	32,016,000
Rice, bu. . . . .	14,612,000	13,500,000
Soybeans, bu. . . . .	3,344,000	3,720,000
Peaches, bu. . . . .	2,967,000	2,646,000

The value of farm chickens including broilers produced in 1945 was approximately \$17,000,000.

**Manufactures.**—Lumber production in 1945 was estimated at 1,080,000,000 bd. ft.

Gross manufacturing production in 1945 was estimated at \$618,000,000. The comparable figure for 1944 was \$619,000,000. The Arkansas economic council reported 148 new industrial enterprises, and important expansions of old ones occurred

in 1945.

**Mineral Production.**—Mineral production for 1944 (severance tax records) included: barite 159,783 short tons; bauxite 3,169,592 long tons; coal 1,956,166 short tons; clay 53,060 cu.yd.; dolomite 22,017 short tons; glass sand 49,439 cu.yd.; gypsum 13,684 short tons; limestone 153,539 short tons; mercury 73 flasks; manganese 8,801 short tons; natural gas 57,946,053,000 cu.ft.; novaculite 655,480 short tons; petroleum 29,146,685 bbl.; quartz crystals 23,916 lb.; residue gas 509,047,000 cu.ft.; sandstone 293,516 short tons. (C. F. Bs.)

**Armies of the World.** The military need for censorship continued throughout most of 1945, and by the end of the year current data covering the statistics of this subject were not available. The article was therefore omitted. (For related topics *see* AVIATION, MILITARY; MUNITIONS OF WAR; SELECTIVE SERVICE, U.S.; WORLD WAR II.)

**Army Specialized Training Program:** *see* EDUCATION.

**Arnold, Henry H.** (1886- ), U.S. army officer, was born June 25 in Gladwyn, Pa. He was graduated from West Point in 1907 and served in the Philippines until 1909. He was the first aviator to use radio in reporting artillery fire observed from a plane. During World War I he headed the information service of the signal corps's aviation division. Gen. Arnold led a round-trip flight of army bombers to Alaska in 1934. He was named major general, chief of the air corps, 1938. After serving as deputy chief of staff for two years he was promoted to the rank of lieutenant general. When the army air force was put on an equal footing with the ground forces in March 1942, Lt. Gen. Arnold was placed in command. On March 19, 1943, he was made a full general, and late in 1944 he was named a general of the army, a newly created rank. Arnold advocated (June 24, 1945) U.S. retention of key island bases in the Pacific as vital to the defense of the U.S. in the event of a future conflict. He warned, Aug. 17, that the wars of the future would result in frightful extermination in which no country would be safe and disclosed at the same time several new secret weapons possessed by the air force. In testifying Oct. 19 before the senate military affairs committee, he recommended creation of a single department of national defense, with the air force made a co-equal of the army and navy.

**Arsenic.** Production of white arsenic in the United States in 1944 reached a new record high of 36,094 short tons, 16% above 1943, and 45% above 1940. In addition 9,965 tons were imported. Consumption declined from 51,083 tons in 1943 to 43,500 tons in 1944, of which 62% was used in insecticides and 18% in weed killers.

Mexico is the second largest producer, with 16,872 short tons in 1944, against 22,378 tons in 1943. A new plant in Peru recovered about 8,000 short tons in 1944. Accumulations from the recovery of arsenical gold ores in Sweden, totalling possibly as much as 350,000 tons, were expected to be available for European demands, lightening the load on the United States and Mexico. Canada has a small output, amounting to 1,577 short tons in 1943 and 1,314 tons in 1944. (G. A. Ro.)

**Art:** *see* AMERICAN LITERATURE; ARCHITECTURE; PAINTING; SCULPTURE; etc.

**Arteaga y Betancourt, Manuel** (1879- ). The cardinal archbishop of Havana, was born at Camaguey, Cuba, on Dec. 28. He was ordained in 1904 at Caracas, Venezuela, where his family had

emigrated for political reasons, and was educated at Guanabacoa.

In 1911 he returned to Cuba after having represented the Caracas archdiocese at the International Eucharistic congress in Madrid, Spain. Named archbishop of Havana in Dec. 1941, he was consecrated in Feb. 1942.

Archbishop Arteaga was a member of the Third Order of St. Francis and the Knights of Columbus and served the Havana council as chaplain. He received the Simon Bolivar Soles y Rayos decoration from Venezuela and the Order of Carlos Manuel de Cespedes from Cuba.

While occupying the see of Havana, he built the Good Shepherd seminary at Arroyo Arenas and a number of chapels and churches.

Archbishop Arteaga was one of 32 prelates named on Dec. 23, 1945, to become cardinals at a consistory on Feb. 18, 1946.

**Art Exhibitions.** A great variety of exhibitions was held during 1945 with special emphasis on American art. The Pennsylvania Academy Annual (Philadelphia) was unusually lively with top prizes going to moderns: Abraham Rattner won the Temple medal for "Kiosk," Stuart Davis the Scheidt prize for "Ultra Marine" and José de Creeft won the Widener memorial for his vigorous bronze head of Rachmaninoff. In the Nineteenth Biennial at the Corcoran Gallery of Art in Washington, D.C., Reginald Marsh's earthy "Strip Tease in New Jersey" took the \$2,000 Clark prize, and Zsissly (Malvin Marr Albright) received the second Clark prize of \$1,500 for his realistic "Deer Isle, Maine." At Carnegie's annual in Pittsburgh, Pa., top prizes went to Philip Guston for his big blue portrait, "Sentimental Moment"; to George Grosz for his war theme, "The Survivor"; and to Franklin Watkins for a character portrait of J. Stoddell Stokes. The National Academy (New York) showed no favorites in giving 10 of the 12 annual prizes to nonmembers. They also lined up with a new trend by inaugurating their first annual exhibition of drawings. Los Angeles, Calif., and Albany, N.Y., each held their drawing biennial. Chicago's American Annual was one of the best with most of the prizes going to the meticulous painters, Kenneth Hayes Miller, Paul Cadmus, Charles Sheeler and Frank Lanning. Pepsi-Cola staged a second "Portrait of America" with big prize money, \$2,500 to Paul Burlin for "Soda Jerker" and \$2,000 to Max Weber for "Colonial Table."

The Rhode Island School of Design in Providence put on a novel exhibition, "Old and New England," 103 pictures covering the period 1670-1835, contrasting the substantial qualities of Robert Feke, John Copley, Ralph Earl and Gilbert Stuart with the elegancies of England's William Hogarth, Sir Thomas Lawrence and Thomas Gainsborough. Chicago's Art institute, in conjunction with the Whitney Museum of American Art, revived the Hudson River school in a full-scale exhibition of American landscape from 1800-75. The Whitney museum organized the first comprehensive exhibition of the portraits (and two landscapes) of Ralph Earl (1755-1801).

The Cincinnati Art museum reversed the usual procedure of selecting exhibitions and asked 92 art critics throughout the country to choose two paintings each, the result to be known as the "Critics' Choice." A similar idea was followed for an exhibition at the 17th Regiment armory in New York city when 13 local critics were each asked to select ten paintings and two pieces of sculpture. Museum officials reported the results no more impressive than the average exhibition.

Stuart Davis, the contemporary U.S. abstract painter, was given a full-dress showing at the Museum of Modern Art, New York, and, in complete contrast, the Metropolitan Museum of Art arranged a one-man show of the work of William Sidney Mount, the 19th-century U.S. genre painter. This coincided

with the publication of a book on Mount compiled by Bartlett Cowdrey and Hermann Warner Williams, Jr. (assistant curator of painting at the Metropolitan museum).

The Albany Institute of History and Art organized and later circulated "The Negro Artist Comes of Age," thus emphasizing the growing importance of talent among the Negroes. A joint exhibition of the 19th-century Mexican landscape painter, José Maria Velasco, was arranged by the Philadelphia and the Brooklyn museums. Later in the season Brooklyn showed "Four Hundred Years of Landscape" covering the period from the 16th century to the 20th. A memorial show of the work of Russian-born Wassily Kandinsky, noted abstract painter, was held at the Museum of Non-Objective Paintings in New York. Buffalo's Albright Art gallery had a memorial show of work by the great French sculptor, Aristide Maillol.

Needlework was featured by the Virginia Museum of Fine Arts (Richmond) in "The Human Story in Needlework" and the Metropolitan Museum of Art likewise showed a superb collection of Tudor embroidery.

French Impressionists were splendidly shown at the Wildenstein gallery, New York, which held the largest show of the paintings by Claude Monet ever assembled. (This was for the benefit of the children of Giverny, France, where Monet spent so much of his time.) Later, Camille Pissarro was equally well shown. Chicago's Albright twins were accorded a two-man show at the Associated American Artists gallery, New York; not included was their "Picture of Dorian Gray" (done for the Metro-Goldwyn-Mayer motion picture) which was the chief drawing card of the Chicago annual. Andrew Wyeth had his best show to date at the Macbeth gallery (New York). Harry Shaw Newman revived John F. Kensett, scarcely remembered after his death in 1872, and the Rehn gallery (New York) featured Morris Kantor in semiabstract paintings of Monhegan, a new sort of treatment for this much-painted island.

The Encyclopædia Britannica Collection of Contemporary American Painting started a national tour with a gala opening at Chicago's Art institute, and showed, during 1945, in New York at Rockefeller Center; at the Boston Museum of Fine Arts; at the Corcoran Gallery of Art in Washington, D.C.; at the Dayton Art institute; and in December, at the Carnegie

RUBENS' "HOLY FAMILY" and other masterpieces were found in an underground cave at Siegen, Germany, by troops of the U.S. 1st army in 1945. They were not part of nazi loot, but German collections hidden for safety.

Left: HENRY VARNUM POOR'S "Carson McCullers" was first exhibited with the Encyclopædia Britannica collection of 20th century paintings by U.S. artists which opened on Sept. 16, 1945 at the Corcoran galleries, Washington, D.C.

Below: IVER ROSE'S "Sharp Drummer" was another painting shown for the first time at the Encyclopædia Britannica exhibit at Washington, D.C.

Left: "CUB AND INSECT" by Darrel Austin was included in the 1945 exhibit of the Encyclopædia Britannica Collection of Contemporary American Painting

Right: "CHRIST MOCKED BY SOLDIERS," an oil included in the large retrospective exhibit of Georges Rouault which opened at the Museum of Modern Art on April 4, 1945

Institute, Department of Fine Arts in Pittsburgh, Pa.

## Art Galleries and Art Museums.

The Solomon R. Guggenheim Museum of Non-Objective Paintings announced the details of plans for a \$1,000,000 cylindrical museum to be erected in Central park at 89th street, New York. Frank Lloyd Wright designed this novel building whose exhibition galleries were to be in the form of a continuous spiral ramp. Provided in the plan are special facilities for air conditioning, lighting and many new features.

The Metropolitan museum reopened its sequence of galleries of Greek art, arranged chronologically with only the best material on display. This collection, by far the finest in the U.S., enabled the visitor to follow clearly the whole development of Greek culture. From John D. Rockefeller, Jr., the Metropolitan received the gift of a set of ten superb 18th century Gobelin tapestries woven in silk and wool after a 16th century Flemish set, known as the "Months of Lucas." It also announced its postwar building plans which provided for a \$10,000,000 expenditure over a five-year period. The new buildings were to cover an area 25% larger than the present set up and would provide for five separate units consisting of ancient art, oriental art, paintings, decorative arts and American art. This would constitute the most ambitious rebuilding plan ever undertaken by any museum and would allow for a logical and effective arrangement of the Metropolitan's great collections which was not possible under the crowded and confused situation.

After many months in war storage, the treasures of the Frick museum were reinstalled. Several of the pictures were cleaned with the result that the collection appeared under the most favourable possible conditions.

Important acquisitions were made by museums throughout the country. The Rhode Island School of Design in Providence purchased a notable 15th century "Portrait of a Young Priest" attributed to the Flemish master, Hugo van der Goes, and also acquired Pierre Auguste Renoir's well-known "Young Shepherd," a richly painted late work (1910) for which Alexander Thurneyssen posed. The Philadelphia museum purchased the collection of mediaeval and Renaissance art belonging to the late George Grey Barnard. This was his second collection, the earlier one having been purchased by the Rockefellers to form the nucleus of the Metropolitan's Cloisters. Philadelphia also purchased Charles Willson Peale's "Staircase Group," a unique early American painting of two boys realistically depicted going upstairs.

The Cleveland museum made two outstanding purchases: "La Citoyenne Crouzet" by Jacques Louis David, painted about 1795 (Rogers fund), and "La Vie," an important painting of Pablo Picasso's blue period (Hanna fund); it also purchased 25 superb Islamic objects. Indianapolis' John Herron institute acquired Georges Seurat's "Le Port de Gravelines," probably the last work of the French Neo-Impressionist that would ever come on the market, as all his important paintings were, in 1945, in the hands of museums. As the bequest of Herbert L. Pratt, the National gallery in Washington received Thomas Sully's "Portrait of Joseph Dugan," and, as the gift of Chester Dale, two paintings by George Bellows. Since Bellows died in 1925, these paintings became eligible under the National gallery's rule that pictures may be acquired not less than 20 years after an artist's death. "Both Members of This Club" is a vigorous fight picture of 1909 and the other Bellows, a portrait of Mrs. Dale, was done at Newport in 1919.

"A Madonna and Child" and "St. John" were acquired by the Toledo museum for the Edward Drummond Libbey collec-

HANS VAN MEEGEREN with his forged "Jesus Teaching in the Temple" by Vermeer. Painted before expert witnesses in 1945, it absolved him of collaboration charges based on his wealth and revealed a great art hoax. His money derived from the sale of other "Vermeers" to the Boymans Museum in Rotterdam, Hermann Goering, and other collectors

tion, and the Worcester museum purchased an Assyrian alabaster relief made during the reign of Assur-bani-pal (668-626 B.C.). The Art Institute of Chicago bought a fine Renoir "Seated Nude" and, as a gift from Honoré Palmer, received a rare 15th-century "Burgundian Crucifix" by Jacques de Baerze.

The Albright gallery in Buffalo purchased through the Knox fund four distinguished English portraits formerly in the J. P. Morgan collection. These included William Hogarth's "The Lady's Last Stake," Sir Joshua Reynolds' "Cupid as a Link," Sir Thomas Lawrence's "Miss Rosamond Crocker" and George Romney's "Lady Hamilton Reading a Newspaper."

Mr. and Mrs. Walter O. Briggs presented to the Detroit Institute of Art Paolo Veronese's "Mystic Marriage of St. Catherine," brought to the United States in the 1870s by a Boston collector. The City Art Museum of St. Louis acquired "The Blue Mandolin," an abstract painting by Georges Braque done in 1930. Yale university purchased a seascape by Alessandro Magnasco and received, from the estate of Herbert L. Pratt, Gilbert Stuart's portrait of Col. John Trumbull. Charles Burchfield's largest water colour, "The Great Elm," was given to Carnegie institute, Pittsburgh, by Mrs. James H. Beal, Jr. Both the University of Nebraska and the Wichita museum acquired important groups of American pictures including Thomas Eakins' portrait of Mary Hallock Greenewalt (Wichita).

**Art Treasures and World War II.**—A vast amount of destruction of architectural monuments in Europe took place as a result of bombing and land mines. The extent of the damage was not yet fully known at the close of 1945, but a careful survey was being made by the American Commission for the Protection and Salvage of Artistic and Historic Monuments. They did work of inestimable value in putting temporary roofs on bombed structures, thus saving frescoes and other artistic objects from further damage by exposure to bad weather. Italy suffered badly, but fortunately the majority of the paintings in the museums had been removed to places of safety. Near the north Italian town of Vicenza, \$10,000,000 worth of art objects were found which had been removed from museums in Florence and Rome. Several important paintings were ruined when a bomb destroyed the Florentine villa of Bernard Berenson, the great art connoisseur and collector. One of the greatest losses was the destruction of the frescoes in the Campo Santo at Pisa.

In Germany numerous caches were discovered not only of its own art treasures, but of some \$2,000,000,000 worth of loot

from the rest of Europe. In a salt mine near the village of Merkers in the Thuringian forest, 1,000 cases of paintings and sculpture were found. A \$200,000,000 collection of works of art was uncovered in a copper mine near Siegen in Westphalia. The most valuable assemblage of all was discovered in Neuschwanstein castle (erected by the mad King Ludwig II of Bavaria in 1869). Here were many treasures from French private owners such as the Kann, Stern and Rothschild collections in Paris. All of these were destined for the private museum of Hermann Goering.

Though there was considerable damage in Normandy, France suffered relatively few losses. Most of the city of Caen was destroyed, but fortunately its two famous abbey churches were preserved. The contents of the Louvre in Paris were hidden in various castles throughout France and never became known to the Germans. By the close of 1945, the treasures were all being put back and the "Mona Lisa," the "Venus of Milo" and the "Victory of Samothrace" once more occupied their usual places.

Many historic buildings in England were destroyed, but St. Paul's cathedral in London survived, even though almost everything around it was wrecked. A direct hit on the British museum caused the loss of thousands of books, but no art objects were damaged as they had all been removed for safekeeping. In fact, no important painting or object of art was lost by any museum in England due to the fact that removal to war storage had been so effectively carried out. The greatest treasures were placed in Welsh mines specially equipped for the purpose; objects of lesser importance were placed in remote country houses.

(F. A. Sw.)

**Arthritis.** Arthritis of the spine, sometimes called rheumatoid spondylitis, is a chronic progressive disease of the spine, the fundamental lesions of which occur in the small facing joints which give mobility to this structure. Contrary to general belief, it is a fairly common cause of chronic back complaints in young men. The early symptoms are frequently mislabelled as sciatica, backstrain, lumbago, kidney disease or the like. Calcium is deposited in the joints and eventually a completely stiff spine may develop. It was still uncertain at the close of 1945 whether this disease is the same as rheumatoid arthritis involving the other joints or a different disease. In one study it was found that this disease accounted for 18% of patients with chronic back complaints admitted to an army general hospital.

A group of patients with rheumatoid arthritis were found to have blood vessels which can be particularly easily constricted: in other words, the circulation in certain areas may be interfered with more easily than in normal persons. This may explain some of the features of the disease: why some persons are particularly predisposed to it or to flare-ups of the condition after emotional upsets and exposure to cold. A study of the changes in rheumatoid arthritis revealed the presence of nodules in the muscles and around the peripheral nerves. As a result it was concluded that rheumatoid arthritis is not a disease of the joints alone but is also a general condition with the nodular inflammatory lesions serving to explain the usual presence of pain, tenderness and muscle atrophy encountered in the disease.

Gold treatment is not effective in all patients with rheumatoid arthritis; it has been recommended that other types of treatment should be used for at least several months before gold salts are employed. Attempts were being made to develop a gold preparation which would be as effective as those which were available but which would not be so likely to cause dangerous toxic reactions. Several such preparations were being tested.

The evidence indicated that penicillin was completely without value in rheumatoid arthritis. X-ray treatment was employed in some cases and seemed to be a practical and efficient method of treatment. In those cases where this treatment was effective, results were lasting and usually developed shortly after the beginning of treatment. A synthetic drug known as neostigmine was tried in a variety of diseases involving the muscles in which there was spasm, tension and spasticity, paralysis or cramps. In six patients with chronic rheumatoid arthritis relief in various degrees was reported. This group is too small on which to base an opinion but the results were encouraging enough to warrant further investigation.

The provision of adequate institutional care for patients with chronic arthritis was a great need in almost all countries. State pensions for permanent incapacity for work due to chronic articular rheumatism were given to a large number of persons in Sweden. A review of this problem indicated a great need for an increased number of places in homes for chronic invalids and for the establishment of a dispensary organization for rheumatic patients. A similar problem existed in the United States where the number of beds available for patients with chronic arthritis was completely inadequate and where there was need for funds and institutions to care for patients afflicted with this disease.

**Artillery:** see MUNITIONS OF WAR; WORLD WAR II.

**Art Sales.** The Parke-Bernet galleries announced sales totalling \$6,165,920 for their 1944-45 season, an all-time record. This tops the previous year's figure which was considered exceptionally high. A greater number of buyers attended auctions, but there were fewer *émigrés*, so prominent during 1942-43 and 1943-44 seasons. Genre painting and various styles of the 19th century, long out of fashion, came back into popularity again. The largest individual sale—the estate of Mrs. J. Amory Haskell—brought \$375,354, and a close second was the William H. and Cornelius Vanderbilt collection at \$323,195. Two paintings tied for Parke-Bernet's top price, \$30,000, for a single picture—Fra Filippo Lippi's "Madonna" (Schinasi sale) and Jean François Millet's "The Water Carrier" (Vanderbilt sale). Other high prices in the Vanderbilt sale showed the renewed popularity of the Barbizon school and genre painting. Millet's well-known "The Sower" brought \$26,000 and Giovanni Boldini's "Ladies of the First Empire" went for \$11,000. Highest price in the Stotesbury sale, another of the season's prominent auctions, was \$22,000 paid for George Romney's "The Vernon Children."

French 18th century furniture and English and American silver continued to go for high prices and the original manuscript of Edgar Allan Poe's *Murders in the Rue Morgue* brought \$34,000, topping all sales of paintings.

The Kende gallery of Gimbel Brothers reported a season totalling \$3,635,275, which included such prominent collections as Jules S. Bache and Mrs. Frank G. Logan. Jacopo Robusti Tintoretto's "Baptism of Clorinda" in the Logan sale brought \$41,000, the highest price paid for any single object in any New York auction during the season. Frederic Remington's "A Dash for Timber" went for the amazing price of \$23,000.

The Plaza Art Auction Galleries had their best season to date with sales totalling \$1,607,457. Though they had no spectacular individual sale, they reported that prices on all types of

PARTIAL ECLIPSE of the sun, on July 9, 1945, as photographed from a plane over Mt. Ranier near Seattle, Wash. The eclipse was total in a narrow path from Idaho through Montana and into Canada, Greenland, Norway, Sweden, Russia and Siberia

YO, ScO, MgO, O<sub>2</sub>. Previously discovered compounds which were identified were OH, NH, CH, CN, SiH, MgH, C<sub>2</sub>, TiO, CaH, AlO, and ZrO. For 14 other compounds, which had been considered present by other observers, Babcock found no evidence. He pointed out that his list of identifications was not complete, for the number of unidentified molecular absorption bands in the sunspot spectra was greater than the number identified.

*Planetary System.*—Four comets were discovered during 1945, all of them being telescopic objects. Three were discovered by D. du Toit in South Africa, and in each case the observations yielded only a preliminary parabolic orbit. The fourth comet was discovered independently by C. L. Friend and L. C. Peltier. In addition to these, four previously known periodic comets were rediscovered during the year.

Photometric measures with a photocell and infra-red filter revealed a hitherto undiscovered infra-red radiation in the night sky. This intense radiation was discovered by Joel Stebbins and A. E. Whitford at the Mount Wilson observatory in the course of photometric observations of stars and nebulae. The new radiation was found to be far more intense than the ordinary auroral radiation which gives the familiar green line at 5577Å. It was judged to be atmospheric because it showed a variation with zenith distance, because it usually decreased in intensity through the night, and also because of its marked and irregular variation from night to night and from season to season. Exceptional intensity of this radiation on two nights gave the impression of an infra-red auroral display, but there was no correlation with magnetometer readings such as is usually found during brilliant auroral displays. By the use of the photocell with selected pairs of filters Stebbins and Whitford determined the wave length of this radiation as  $10,440 \pm 25\text{Å}$ . According to P. Swings this radiation is undoubtedly of molecular origin, probably being traceable to the (O, O) band of nitrogen. Swings suggested that during the day nitrogen molecules, and compounds containing nitrogen atoms, may be dissociated into

nitrogen atoms by absorption of solar radiation in the far-ultra-violet. These nitrogen atoms may tend to recombine during the course of the night, mainly in three-body collisions with the third body a nitrogen molecule which is a major constituent of the atmosphere at any altitude. Thus two nitrogen atoms and a normal nitrogen molecule combine in a three-body collision to yield one normal and one excited nitrogen molecule, the excited molecule thereafter emitting the observed infra-red radiation. Swings expressed the opinion that this suggested mechanism of emission was the only explanation of the intense night-sky emission near 10,440Å having sufficient plausibility.

*Stars.—Special Stars and Stellar Structure.*—The intrinsic luminosity of novae is an important datum in the study of these stars and a quantity difficult to determine. A new investigation of this problem by D. B. McLaughlin, based on all available observations, threw new light on the problem. The determination of absolute magnitudes of novae may be accomplished in several ways. The most reliable determinations have been effected by coupling observed angular rates of expansion of the nebular shells with the velocities of the gases observed with a spectrograph. Intensities of interstellar absorption lines in novae spectra, and residual velocities of these lines when interpreted as due to galactic rotation, yield further data on luminosities. Luminosities of novae in the Andromeda nebula and the greater Magellanic Cloud, whose approximate distances are known, are roughly determinate. McLaughlin used all these methods to obtain reasonably reliable luminosities for 30 common novae. He found that a definite relation exists between these luminosities and the rates of decline of brightness of the novae, the brightest novae showing the most rapid decline in brightness. This "life-luminosity" relation he found well determined for the common novae, so that a reliable prediction of the luminosity of a common nova could be made from its light curve. The supernovae, however, do not agree with this relation. This fact lends added weight to the belief that a supernova owes its explosive outburst to a different sort of mechanism than that which produces the outburst in a common nova.

In 1939 a study of the spectra of planetary nebulae by I. S. Bowen and Arthur Wyse led to the suggestion that the chemical

composition of these objects was essentially the same as that of the sun. This question was re-examined by L. H. Aller and D. H. Menzel. They made an extensive and intricate theoretical investigation of the relative abundances of the lighter elements, and by means of their more elaborate discussion, they arrived at substantially the same conclusion as that reached by Bowen and Wyse. They concluded that a mass of gas of chemical composition similar to that of the sun, when expanded to the low density of a planetary nebula and exposed to ultra-violet radiation, would give the sort of spectrum observed for these nebulae.

**External Galaxies.**—The similarity of the Andromeda nebula to our own galaxy was further demonstrated by star counts in the nebula made by C. K. Seifert and J. J. Nassau. These star counts show the nebula to be roughly elliptical in shape and agree well with isophotal contours obtained from photometric studies of nebular photographs. The thickness of the nebula was estimated from counts of high-luminosity stars to be about 200 parsecs. This agrees with estimates of the thickness of our galaxy made by J. H. Oort. Seifert and Nassau find an absence of highly luminous stars in the outermost envelope of the Andromeda nebula.

**Phenomena Visible in 1946.**—*Jan. 3, 1946. Partial Eclipse of the Sun.*—Visible in southern Indian ocean and southern Pacific ocean. Maximum eclipse 0.55 sun's diameter.

*May 30, 1946. Partial Eclipse of the Sun.*—Visible in southern Pacific ocean and near sunset in Chile and western Argentina. Maximum eclipse 0.89 sun's diameter.

*June 14, 1946. Total Eclipse of the Moon.*—Visible in Antarctica, Australia, the western Pacific ocean, southern and central Asia, the Indian ocean, Africa and Europe; the ending also visible in the south Atlantic ocean and extreme eastern part of South America. Duration of total eclipse 1 min. 32 sec.

*June 29, 1946. Partial Eclipse of the Sun.*—Visible in Scandinavia, Russia, and Siberia. Maximum eclipse 0.18 sun's diameter.

*Nov. 23, 1946. Partial Eclipse of the Sun.*—Visible in United States and Canada, Yucatan, Honduras, northern South America, the West Indies and the north Atlantic ocean. Maximum eclipse 0.78 sun's diameter.

*Dec. 8, 1946. Total Eclipse of the Moon.*—Visible in the Arctic ocean, northwestern North America, northern and western Pacific ocean, New Zealand, Australia, Asia, Europe, Africa, and the eastern Atlantic ocean. Duration of total eclipse 58 sec.

## Athlone, 1st Earl of

(ALEXANDER AUGUSTUS FREDERICK WILLIAM ALFRED GEORGE CAMBRIDGE) (1874– ), British statesman, was born April 14 at Kensington palace, the third son of the 1st duke of Teck. Educated at Eton and the royal military college, Sandhurst, he served in Matabeleland, Southern Rhodesia, in 1896 and saw action during the Boer War. During World War I he was mentioned twice in dispatches, and in 1917 he was created 1st earl of Athlone. He was governor general of the Union of South Africa from 1923 to 1931. In 1936 he was appointed personal aide-de-

camp to the king. He was appointed 16th governor general of Canada April 3, 1940, on the death of Lord Tweedsmuir. In opening the Canadian parliament in Jan. 1944, he urged all nations allied in the war to seek to ensure an enduring peace through a world organization.

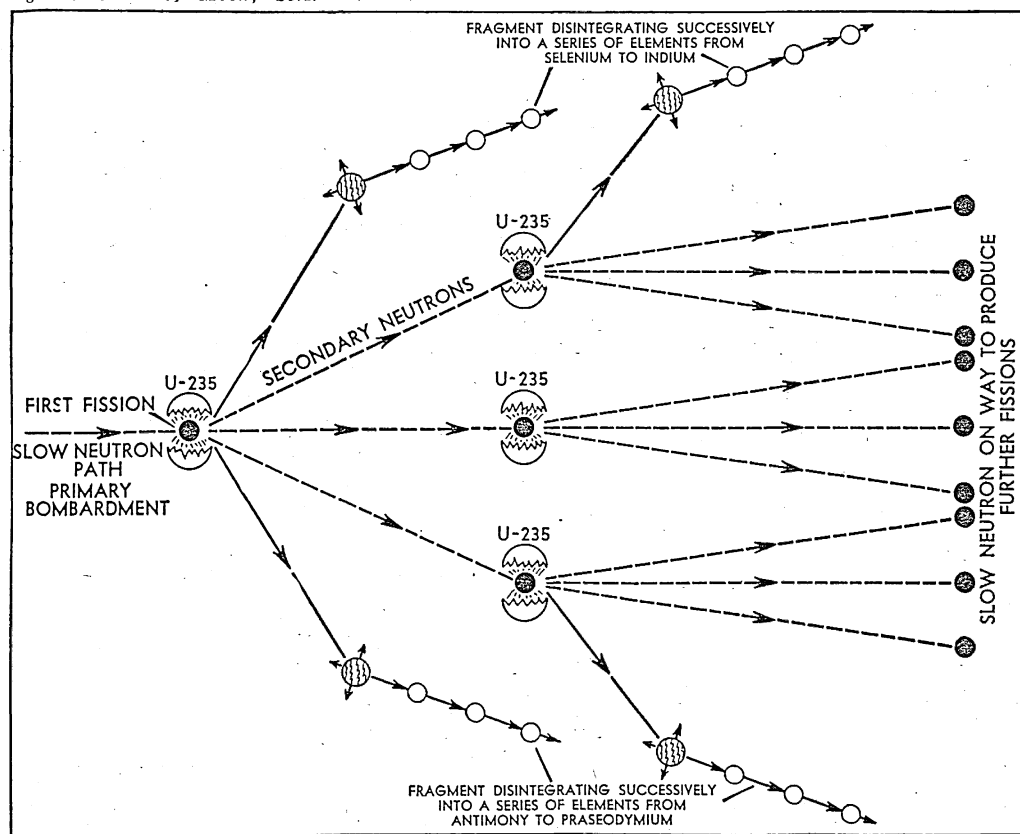

The earl was scheduled to give up his post as governor general in the spring of 1946 to Field Marshal Sir Harold R. L. G. Alexander, whose appointment was announced by King George VI, July 30, 1945.

**Atomic Bomb.** Atomic bomb is the name given to a bomb which obtains its explosive violence from the release of atomic energy, or more exactly, the conversion of matter into energy by an atomic transformation known technically as nuclear fission. No comparable weapon has existed in the history of the world. The first one dropped had more power than 20,000 tons of T.N.T.

Based on the discovery of uranium fission by O. Hahn and F. Strassman in Germany in 1939, the atomic bomb was perfected in the United States during World War II as a joint venture of the United States, British and Canadian governments. The first bomb was exploded in a test on the New Mexico desert on July 16, 1945. Two atomic bombs were dropped on Japan from U.S. aeroplanes, the first on Hiroshima on Aug. 6, 1945 (Japanese time), the second on Nagasaki on Aug. 9 (Japanese time). Japan surrendered on Aug. 14. Former Prime Minister Winston Churchill estimated that by shortening the war, the atomic bomb had saved the lives of 1,000,000 U.S. soldiers and 250,000 British soldiers.

The release of atomic energy is one of the greatest triumphs in the history of science, perhaps the most significant development in the progress of mankind after the discovery of the use of fire. It has equally vast potentialities for good and for evil.

Simplified diagram of a fission chain reaction. A slow neutron enters the uranium isotope U-235, destroying its equilibrium. The unstable isotope splits into two initial fragments each of which decays rapidly into a whole series of radioactive and stable elements, and a considerable excess of neutrons. The fast neutrons freed by fission are slowed by moderators (not shown in diagram), strike other atoms of U-235, and the action spreads rapidly

THE CYCLOTRON, an atom-smashing machine based on the multiple acceleration of nuclear particles, was invented by Dr. E. O. Lawrence (right) and used in the experimental work on nuclear fission

Used in another world war, it would result in the destruction of civilization. But in its peaceful application to industry, transportation and other activities, it promises the start of a new era, the Era of Atomic Energy, capable of becoming the most glorious period in the history of mankind.

**The Einstein Equation of 1905.**—The train of events that led to the bomb may be said to have started with the discovery of radioactivity by A. H. Becquerel in 1896 and the pioneer investigations of the subject by Lord Rutherford at the turn of the century. The possibility of the conversion of matter into energy entered scientific discussion as the result of an equation written by Albert Einstein in 1905. One consequence of the theory of relativity is that the mass of a body increases with an increase in its rate of motion. Einstein extended this fact into the mathematical equation for the equivalence of mass and energy. Gradually it became evident that matter ought to be converted into energy under certain conditions.

Up to this time physicists had regarded matter and energy as forever separate and distinct. The law of the conservation of matter held that it was possible only to alter the form of matter, not to create or destroy it. The law of the conservation of energy made the same statement with regard to energy. Einstein's theory of equivalence made it necessary to merge these two into one. This was done by regarding the particles of matter as forms of concentrated energy, a view that had been suggested earlier by Sir Oliver Lodge and others.

The Einstein theory of equivalence states that  $E=mc^2$  where  $E$  is the energy in ergs,  $m$  the mass in grams, and  $c$  the velocity of light in centimetres per second. Since the velocity of light is very large, this means that a very little matter would become a very large amount of energy. Calculations showed that 1 kilogram (2.2 lb.) of matter, if converted entirely into energy, would become 25,000,000,000 kilowatt-hours of energy, an amount equal to all the electric power generated in the United States in two average months. By contrast, the combustion of 1 kilogram of pure coal produces 8.5 kilowatt-hours of energy.

**Atomic Structure.**—Because of our familiarity with ordinary phenomena, we tend to forget that they are all atomic in nature. Lord Rutherford first advanced the theory of an atom with a central nucleus. Niels Bohr developed the further theory that electrons revolve around this nucleus like planets around the sun. According to present theory, three particles enter into the composition of atoms, namely, the proton, the neutron and the electron. Protons and neutrons occur in atomic nuclei. Elec-

trons compose the "cloud" of particles surrounding the nuclei. The proton possesses a positive electric charge, the electron an equal but negative charge, the neutron none. Ordinary chemical reactions do not involve changes in the atomic nucleus but only the combination of atoms into molecules. However, the release of atomic energy does involve nuclear changes.

The simplest atom, that of ordinary hydrogen, has a nucleus consisting of one proton. In all other atoms the nucleus is composed of protons and neutrons. The number of protons in the nucleus determines the total positive charge on the nucleus and is known as the atomic number. The sum total of protons and neutrons is known as the mass number. Atoms of the same atomic number but different mass numbers constitute isotopes of the same chemical element.

**The Release of Energy.**—One might expect the weight of a nucleus to be equal to the combined weights of a corresponding number of protons and neutrons. But this is not the case. As a result an arbitrary scale was adopted in which the atomic weight of oxygen is taken as 16. In every case the atomic weight of a nucleus is less than the combined weights of the number of protons and neutrons composing it. This "mass difference," as it is called, is the result of the crowding of the particles into the nucleus. On the basis of the Einstein equation of 1905, this loss of mass which would occur on bringing a number of protons and neutrons together to form a nucleus should be transformed into energy.

The ordinary electrical force or Coulomb force which acts between charged particles causes protons normally to repel each other and has no effect upon neutrons. It is obvious that without some other force, the nucleus of the atom could not hold together. Another and vastly stronger force comes into play at the infinitely small distances within the nucleus of the atom. It is an attractive force acting on both protons and neutrons and is known as the "binding force." It is usually expressed as the binding force per particle and is equal to the "mass difference" of the particular nucleus divided by the number of particles composing it. Investigation has shown that the binding force per particle is not the same for every element. It varies irregularly for the first 10 elements in the periodic table, then rises rapidly to a flat maximum around nickel (elements of about mass number 60). It then gradually decreases for the succeeding elements.

Now it is apparent that any transformation of a nucleus to another in which the binding force is greater will produce a further loss of mass and its consequent transformation into energy. It became evident to physicists, therefore, that there are two ways in general to obtain the release of atomic energy. One is by the synthesis of the very light nuclei into heavier ones. The other is by the breaking down of the heaviest nuclei. Astronomers have demonstrated that the first method accounts for the generation of energy in the deep interior of the sun and stars but it does not appear possible to duplicate the conditions of temperature and pressure apparently necessary to sustain these reactions. The second method is that employed in the atomic bomb.

#### THE HISTORY OF "ATOM SMASHING"

A long chain of investigations in nuclear physics, known popularly as "atom smashing," led up to the atomic bomb. As in the case of every great scientific development, these steps were taken by many workers in many countries, demonstrating once again the truly international character of scientific progress.

**Lord Rutherford.**—The great pioneer in atom smashing was Lord Rutherford who had first advanced the nuclear theory of atomic structure. In 1919, by bombarding nitrogen with alpha particles emitted by radium, he succeeded in knocking protons (hydrogen nuclei) out of the nitrogen nuclei. The nitrogen was thus transformed into an isotope of oxygen, so that Rutherford

had accomplished the ancient dream of transmuting one chemical element into another. The equation for this reaction is written

using the notation commonly employed in nuclear chemistry in which the subscript represents the atomic number and the superscript the mass number.

Rutherford's experiment started a wave of atom smashing in the laboratories of the whole world.

**The Giant Atom Smashers.**—It gradually became apparent that atom-smashing experiments required subatomic projectiles of greater energy than the alpha particles of radium. Accordingly physicists sought methods of accelerating streams of alpha particles (helium nuclei) or protons (hydrogen nuclei). One method employed electric transformers and vacuum tube rectifiers to obtain continuous direct current high voltages for this purpose. Much higher voltages, ranging up to 15,000,000 volts, were obtained with the electrostatic generator invented by Robert J. Van de Graaff in 1929. In the same year E. O. Lawrence invented the cyclotron, a device which imparts tremendous speeds to subatomic projectiles by whirling them around in a magnetic field.

**Einstein Equation Applied to Nuclear Phenomena.**—The first great success of the giant atom smashers came in 1932 when J. D. Cockcroft and E. T. S. Walton bombarded lithium with streams of protons. They found that a lithium nucleus combined with a proton and split into two helium nuclei. This nu-

clear reaction may be written

This reaction was accompanied by the release of energy. Calculations showed that the Einstein equation of 1905 applied to this reaction with great exactness.

**Discovery of the Neutron.**—About 1920 Rutherford suggested the problem of nuclear structure would be greatly simplified if there existed a particle with the mass of the proton but no electric charge. He proposed the name of the "neutron" for this hypothetical particle. In 1932 J. C. Chadwick demonstrated that what had been assumed to be extremely penetrating radiation in certain atom-smashing experiments actually was these very neutrons. It is not possible to exaggerate the importance of this discovery in the development of an understanding of atomic structure and behaviour.

**The Deuteron.**—The existence of the neutron was verified when in 1932, Harold C. Urey, F. G. Brickwedde and G. M. Murphy discovered an isotope of hydrogen of twice the mass of ordinary hydrogen. Its nucleus consists of a combination of one proton and one neutron and this combination became known as the deuteron. Water in which ordinary hydrogen is replaced by this double-weight hydrogen or "deuterium" became known as "heavy water."

**The Positron.**—In 1932 Dr. Carl D. Anderson, investigating cosmic rays, discovered a subatomic particle equal to the electron in mass but of opposite electric charge. This particle became known as the positive electron or positron. It was subsequently shown that a collision between a positron and electron results in the annihilation of both and their transformation into

HIROSHIMA, scene of the first atomic bombing of Japan on Aug. 6, 1945. An area of 4.1 sq.mi., or 60% of the city, was laid waste when a single bomb, said to be equivalent in explosive power to 20,000 tons of T.N.T., was dropped by U.S. fliers

"THE ATOM IS ON THE LOOSE." Darling of the *N.Y. Herald Tribune* saw in 1945 a startled world threatened by the problem of controlling its own scientific achievement

energy. Conversely, it was found that under certain circumstances a ray of energy is transformed into a positron and an electron, a phenomenon known as "pair production," to the experimental facts of which the Einstein equation also applies.

**Artificial Radioactivity.**—In 1934 Irene Curie and F. Joliot discovered that many elements, when bombarded with subatomic particles, became unstable isotopes which subsequently emitted particles after the fashion of the radioactive elements. The name of "artificial radioactivity" was given to this phenomenon. Subsequent study showed that in many cases this is due to the transformation within the nucleus of a neutron into a proton and an electron with immediate emission of the electron. In other cases, a proton is transformed into a neutron and a positron with immediate emission of the positron.

**The Slow Neutron.**—In 1934 Enrico Fermi demonstrated that the ideal stream of projectiles for atom smashing were neutrons that had been slowed down by elastic collisions with light atomic nuclei while passing through water, paraffin, or some other suitable substance. Until then physicists had used streams of alpha particles or protons which had to batter their way into the nucleus against the repulsion of the positive charge on the nucleus. The neutron was not subject to this repulsive force and Fermi's studies showed that if it were moving slowly, it had a better chance of sticking in the nucleus, a phenomenon named "neutron capture" which is often followed by disruption of the nucleus. One of Fermi's most spectacular achievements was to use this phenomenon of neutron capture to transform uranium (atomic number 92) into a previously unknown element of atomic number 93. This was the first of the so-called transuranic elements. However, this experiment gave puzzling results which were not explained until the discovery of fission.

One might wonder why power plants for the release of atomic energy were not built in the 1930s. The answer is that the known methods were too inefficient. More energy was expended

in producing streams of subatomic particles than was subsequently released from the bombarded atoms. Many physicists were sceptical of the situation ever becoming otherwise. It was realized that the release of atomic energy required a so-called "chain reaction," which, once initiated, would sustain itself. Combustion, for example, is a chain reaction. A fire, once ignited, continues to burn, the combustion of each bit of fuel raising the neighbouring bit to the temperature of combustion.

**Uranium Fission.**—The turning point in the quest for atomic energy came in Jan. 1939, eight months before the start of World War II, with the announcement by O. Hahn and F. Strassman that barium was one of the products when uranium was bombarded with neutrons. The significance of this discovery was communicated by Lise Meitner and O. R. Frisch, refugees from Germany in Copenhagen, to Professor Bohr who was preparing to visit the United States. Arriving in the U.S. on Jan. 16, Bohr discussed the theory with Einstein, J. A. Wheeler and others. It meant that the uranium atom had split into two nearly equal fragments, an atomic transmutation from the end of the periodic table where the binding force is least to the centre of the table where it is greatest. Calculations showed that such a "fission" of the uranium atom should release an incredible amount of energy, nearly 200,000,000 electron volts. It meant that one pound of uranium would produce by fission as much energy as the combustion of 20,000,000 lb. of coal.

Both Bohr and Fermi discussed uranium fission at a conference on theoretical physics in Washington on Jan. 26, 1939, and Fermi made the further suggestion that neutrons might be released during the process. Here then was the possibility of a chain reaction of the type needed for the wholesale release of atomic energy. These suggestions threw the meeting into an uproar while those physicists whose laboratories contained cyclotrons rushed to the telephone to initiate by long-distance calls experiments seeking to confirm this phenomenon of fission.

Subsequent theoretical studies by Bohr and Wheeler indicated that slow neutrons did not cause fission in ordinary uranium or U-238, so-called because its mass number is 238, but in U-235, an isotope of mass number 235, present in ordinary samples of uranium to the extent of 1 part in 140. Gradually the many riddles presented by fission were solved and by June 1940 the basic facts concerning the release of atomic energy were known throughout the scientific world.

One important result of these studies was the discovery that with neutrons of certain speeds U-238 exhibited a high probability for neutron capture, becoming an unstable isotope, U-239, which by emitting a beta particle became a new element, No. 93, to which the name of "Neptunium" was given. But this was also unstable and by emitting another electron became element No. 94, named "Plutonium." The reaction may be written

where Np is neptunium, Pu plutonium,  ${}_0\text{n}^1$  the neutron and  ${}_{-1}\text{e}^0$  the electron.

It was also found that fission took place in both thorium and protoactinium with fast neutrons.

**Possibility of Chain Reactions.**—It was realized that the setting up of a chain reaction depended upon the number of neutrons released by the initial fissions and their subsequent fate. A neutron might escape without accomplishing any effect, it might take part in nonfission capture, or it might cause fission. The ratio of neutrons causing fission to the other neutrons is known as the multiplication factor. For a chain reaction it must be greater than 1. It was also realized that the size and shape

of the mass of uranium would be a factor in bringing about a chain reaction.

Physicists therefore foresaw two possibilities. One was the setting up of a chain reaction in ordinary uranium, a mixture of U-234, U-235 and U-238, employing slow neutrons for the controlled release of atomic energy for power purposes. The other was the creation of a chain reaction of explosive character in pure U-235 or plutonium with fast neutrons. This would be an atomic bomb. It was believed that the controlled reaction would require at least several tons of uranium whereas the critical size of the bomb would be between 1 and 100 kilograms.

A complication in obtaining the controlled reaction arose from the fact that fission releases high-speed neutrons whereas slow neutrons are the most desirable for producing fission. The suggestion was made that the uranium be mixed with some other substance of a character such that the neutrons would be slowed down by elastic collisions with its atoms. Hydrogen, deuterium, beryllium and carbon were suggested for this "moderator," as it was named. Fermi and L. Szilard proposed a superior method, namely, to embed lumps of uranium in a matrix of some moderator not unlike raisins in a cake. This construction came to be known as a "lattice" and the resulting structure as a "pile."

Construction of a bomb, therefore, required either the separation of pure U-235 from ordinary uranium or the construction of a uranium pile, not primarily for the generation of power but the transmutation of U-238 into plutonium which could then be separated by chemical means. The first sample of pure U-235 was isolated by Alfred O. Nier in Feb. 1940 by means of the mass spectrograph. Slightly larger amounts were produced shortly thereafter by K. H. Kingdon and H. C. Pollack.

#### THE ATOMIC BOMB PROJECT

The story of the production of the atomic bomb is in many ways as unique as the bomb itself. At the centre of the enterprise was a brilliant group of United States, British and refugee scientists. While engaged in one war in Europe and another in the Pacific, the United States marshalled the manpower and resources needed to complete in four years a project that otherwise might have taken half a century. The cost of the project, \$2,000,000,000, indicates its magnitude.

It is difficult to assign credit to all those who took part in the venture. The brilliant group of research scientists formed its heart. But later, as the project developed and vast plants had to be built and tens of thousands of workers employed, the co-operation of a large number of the nation's chief industrial corporations as well as that of the war department and other branches of the government was required. The decision to embark on the project had to be made by President Roosevelt himself, and he and his advisers, both civil and military, deserve the highest praise for their courage and foresight.

The first contact with the government was made by George B. Pegram of Columbia university who arranged a conference between Fermi and officers of the navy in March 1939. In July, L. Szilard and E. Wigner conferred with Einstein and later the three went to New York to talk with Alexander Sachs. Supported by a letter from Einstein, Sachs explained the importance of the problem to President Roosevelt who appointed an Advisory Committee on Uranium with L. J. Briggs, director of the national bureau of standards as chairman, to look into the problem. In Feb. 1940, a fund of \$6,000 was made available to start researches. Probably no one then realized that this was the beginning of a \$2,000,000,000 expenditure.

HIROSHIMA, viewed from the air after it was levelled by a single atomic bomb in Aug. 1945. Once a congested area of factories and houses, it was reduced to rubble by the destructive power of the new weapon

SMOKE rising 20,000 ft. in dense clouds above Nagasaki on Aug. 9, 1945, following the second atomic bombing of Japan

By this time it was well known that Hitler had embarked German physicists upon atomic bomb researches. The British were also studying the problem and in the fall of 1941 Urey and Pegram visited England to get first-hand information on what was being done there.

On Dec. 6, 1941, the project was put under the direction of a uranium section of the Office of Scientific Research and Development. Members of this section were James B. Conant, representing Vannevar Bush, the director of the Office of Scientific Research and Development; L. J. Briggs, chairman; G. B. Pegram, vice-chairman; A. H. Compton, program chief; E. O. Lawrence, program chief; H. C. Urey, program chief; E. V. Murphree, chairman of the planning board; H. T. Wensel, technical aide; S. K. Allison, J. W. Beams, G. Briet, E. U. Condon and H. D. Smyth. On June 18, 1942, the war department organized a new district in the corps of engineers to carry on the work of the atomic bomb. This was named the Manhattan District and on Sept. 17, 1942, Brig. Gen. L. R. Groves was placed in complete charge of all army activities relating to the project. A number of British scientists were transferred to the United States in 1943 and in August of that year a combined policy committee, representing the United States, Great Britain and Canada was set up.

Because there was no way of knowing in advance what method would succeed, it was decided to work simultaneously on several methods of isolating U-235 and also on the production of plutonium.

**Production of Plutonium.**—The first experimental pile was

set up at Columbia university in July 1941. It was a graphite cube about eight feet on edge and contained about seven tons of uranium oxide. At the end of the year the work on such piles was transferred to the University of Chicago where a considerable number of related problems were being studied by a group, under the direction of A. H. Compton, known cryptically as "The Metallurgical Laboratory." On Dec. 2, 1942, the first self-sustaining chain reaction pile was put into operation, thus establishing that such a pile was feasible for the controlled release of atomic energy for power purposes or the manufacture of plutonium.

It was felt that the time had arrived when a pilot plant for the production of plutonium could be built and it was decided to locate it on the site which had been acquired in the Tennessee valley and named the Clinton Engineer Works. This was a 70-sq.mi. tract on the Clinch river about 30 mi. from Knoxville, Tenn. A more isolated site was subsequently chosen for the full-size plants, a 1,000-sq.mi. tract on the west bank of the Columbia river, north of Pasco, Wash. This was named the Hanford Engineer Works.

An enormous number of engineering problems had to be solved in building the Hanford uranium piles. They were so designed that the uranium was employed in the form of rods encased in metal containers. These were inserted into the piles by automatic machinery governed by remote control since no one could safely enter the chamber where a pile was located. They were subsequently removed by similar means and transported to the plants where the plutonium was separated. These likewise had to operate by remote control because of the radioactivity of the fission products in the uranium rods. Heavy concrete walls were built as shields to protect workers from the radiations released by the uranium piles and separation plants.

**The Isolation of U-235.**—At the end of 1941 the problem of separating U-235 from ordinary uranium was assigned to two groups working under the direction of Lawrence and Urey. A method of separation by means of gaseous diffusion was developed by Urey and his group. This required the conversion of the uranium into a gaseous compound which was then permitted to diffuse through porous barriers. Since the rate of diffusion differs for the various isotopes, a separation was thus effected.

Lawrence and his group developed an electromagnetic method of separation which was essentially an extension of the mass spectrograph. It operated upon the principle that the amount by which a magnetic field bends the path of a stream of nuclei from a straight line depends on the weight of the nuclei. Huge plants employing both methods were built at the Clinton Engineer Works. Subsequently, in order to speed up the production of the electromagnetic plant, a thermal diffusion plant, using a method developed by P. H. Abelson, was built to make a preliminary separation of the isotopes.

**The Atomic Bomb Laboratory.**—For the final stages of the project, it was felt wise to establish an atomic bomb laboratory in an isolated place, both for the sake of secrecy and safety. A site was chosen at Los Alamos, N.M., on a mesa about 20 mi. from Santa Fe. J. R. Oppenheimer assumed direction of this laboratory in March 1943. A group of brilliant physicists, chemists, and authorities on explosives and weapons, recruited from all parts of the U.S. and including H. Bethe, R. R. Wilson, J. W. Kennedy, C. S. Smith, Capt. W. S. Parsons, G. B. Kistiakowsky, R. F. Bacher and E. Fermi among others, moved into the laboratory. Sir James Chadwick and Niels Bohr also spent much time at Los Alamos.

By this time researches had revealed that in a mass of either U-235 or plutonium of a certain critical size a fast neutron chain reaction would take place in which the multiplication of neutrons would be so rapid as to bring the reaction to the point of

explosive violence. The problem before the Los Alamos laboratory was to determine with great exactness this critical size and then to design a mechanism for bringing smaller masses of the material together quickly. The chain reaction would then cause the explosion. An obvious method of assembling the bomb was to load half of it into a gun and shoot it into the other half of the bomb which served as a target.

## THE EXPLOSION OF THE BOMBS

A total of three atomic bombs were set off prior to the surrender of Japan, one in a test in New Mexico, two in actual warfare.

**The Test.**—The first atomic bomb in the history of mankind was exploded at 5:30 A.M. on July 16, 1945, at the Alamogordo air base in the desert 120 mi. southeast of Albuquerque, N.M. The bomb had been placed on a tall steel tower while scientists and military experts occupied observation posts placed at distances ranging from 10,000 to 17,000 yd. from the tower. They had been instructed to lie down with their feet toward the tower and to protect their eyes from the blinding flash of the explosion. The skies were dark and it was raining. An occasional lightning flash illumined the sandy desert and the distant mountains.

The explosion caused a flash that lit up the mountain peaks 10 mi. away. Then came a tremendous, sustained roar accom-

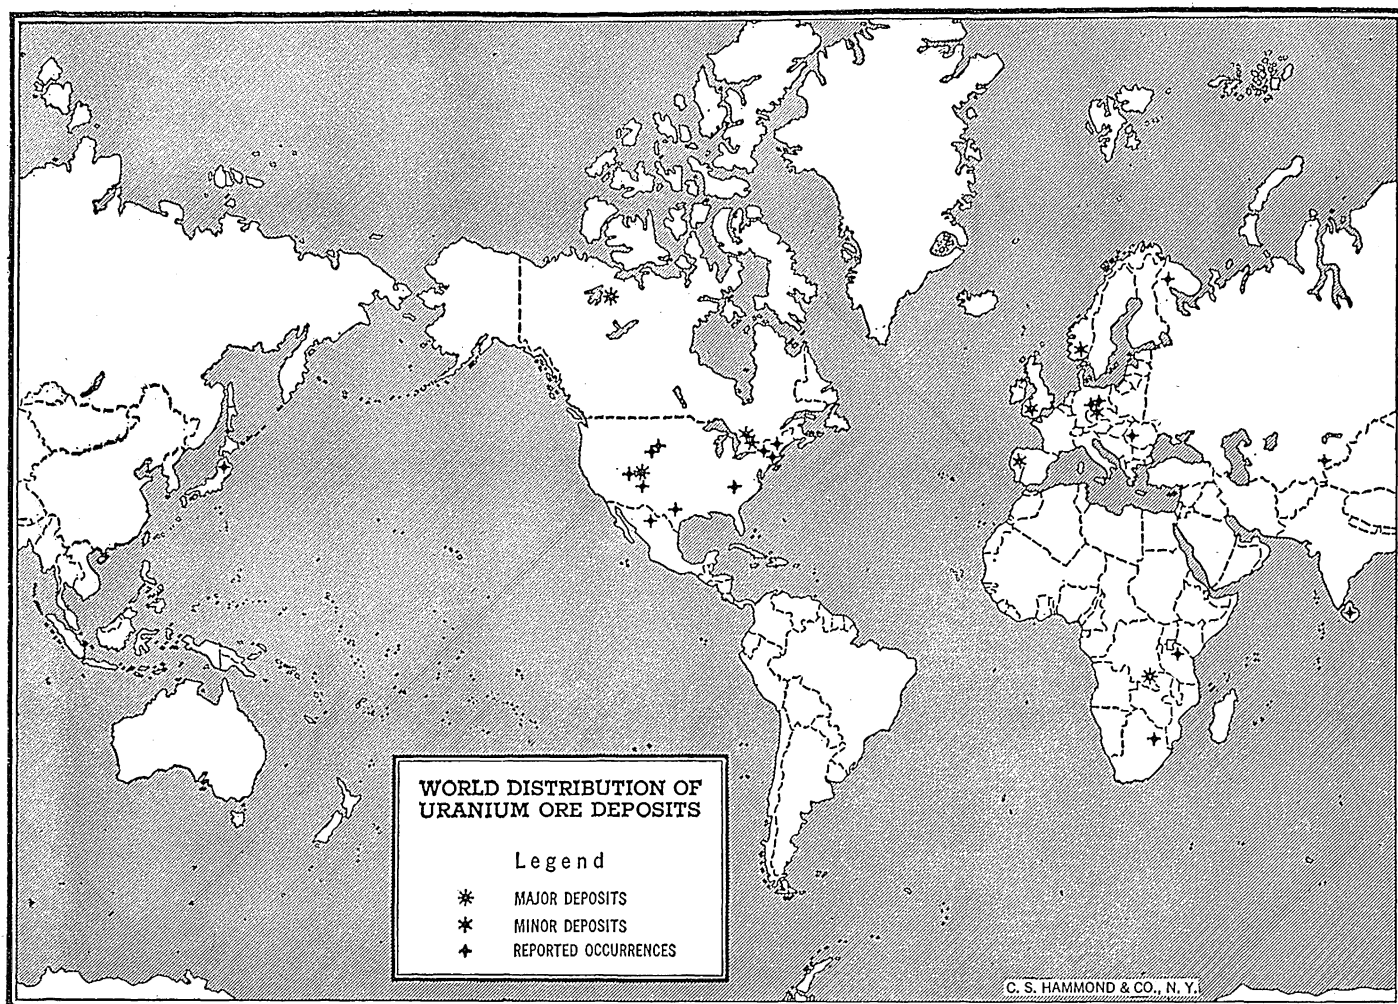

panied by a tornadolike burst of wind. Where the tower had stood there was a great boiling, surging cloud of many colours rising into the stratosphere, more than 40,000 ft. in height. When the cloud had disappeared, it was noted that the steel tower was gone. The heat of the explosion, estimated at several millions of degrees, had completely vaporized it. In place of the tower there was a huge crater, the floor of which consisted of a glass formed by the fusion of the sand.

**The Bombing of Hiroshima.**—The first atomic bomb to be used in warfare was dropped on Hiroshima, a Japanese army base and city of 343,000 inhabitants, at 9:15 A.M., Aug. 6 (Japanese time), 1945. The bomb was dropped from a B-29 Superfortress, the "Enola Gay." Col. Paul W. Tibbets, Jr., was the pilot and Major Thomas W. Ferebee the bombardier. Capt. Parsons, who had helped design the bomb, went along as the "weaponer." The flash of the explosion was seen by a reconnaissance plane 170 mi. away. Those in the "Enola Gay" reported that a black cloud rose over Hiroshima to a height of 40,000 ft. Aerial photographs taken after the smoke and dust had cleared away showed a scene of destruction unlike any before witnessed. The entire business section at the centre of the town had disappeared except for the skeletons of three concrete buildings. It was estimated by the Japanese government that the bomb killed 60,000 persons, wounded 100,000 and rendered an additional 200,000 homeless.

**The Bombing of Nagasaki.**—The second bomb to be used against Japan was dropped on Nagasaki at 12:01 P.M., Aug. 9 (Japanese time), from a B-29 Superfortress, the "Great Artist," piloted by Major Charles W. Sweeney. It was said that

OAK RIDGE, TENN., 59,000-acre site of the Clinton Engineer works, and largest division of the giant U.S. government atomic project. Oak Ridge's population, estimated at 78,000 in 1945, knew nothing of what it was producing. The site was chosen for its nearness to TVA power and water and its remoteness from the coast

the construction of this bomb was so superior to that used at Hiroshima as to render that model obsolete. This second bomb created a considerable crater. Its toll of human life was smaller due to the smaller population of Nagasaki. The Japanese government estimated that 10,000 persons were killed, 20,000 wounded, and an additional 90,000 made homeless.

#### THE FUTURE OF ATOMIC ENERGY

Following a message from President Truman on Oct. 3, 1945, a bill sponsored by the war department and known as the May-Johnson bill was introduced into congress. The purpose of this bill was to keep the atomic bomb a secret and to set up a commission charged with the administration and control of all research in the field of atomic energy and the formation of security regulations stipulating what might or might not be made public. The bill aroused the immediate antagonism of the great majority of scientists who had worked on the bomb and they made their opinions public through hastily formed organizations such as the Atomic Scientists of Chicago, the Association of Oak Ridge Scientists, and the Federation of Atomic Scientists. This sudden entrance of scientists into the arena of public affairs was unique in United States history.

**The Scientists' Viewpoint.**—The scientists were convinced that any attempt to keep the bomb a secret was futile because all the fundamental scientific facts were known throughout the world in 1940. They believed that the only result of the attempt would be to embark the world upon an international atomic bomb race certain to end in World War III and the destruction of civilization. Moreover, they regarded the proposed controls over scientific research as contrary to the basic principles of U.S. democracy and inimical to scientific progress.

The scientists advocated instead a policy of international cooperation with a return to the classic freedom of scientific research and the creation of an international inspection committee by the United Nations Organization charged with the task of seeing that no nation set up plants for the manufacture of atomic bombs or the concentration of fissionable materials in forms and amounts suitable for quick conversion into bombs.

After stormy debate the United States senate created on Oct. 26, 1945, a special committee to study the problem and appointed as chairman of the committee Senator Brien McMahon (Democrat, Conn.) who had expressed his opposition to the May-Johnson bill.

**International Action.**—Prime Minister Clement R. Attlee of Great Britain arrived in Washington on Nov. 11 for a conference with President Truman and Prime Minister W. L. Mackenzie King of Canada. In a joint statement on Nov. 15 they expressed their willingness to share, on a reciprocal basis with other members of the United Nations Organization, the practical application of atomic energy "just as soon as effective enforceable safeguards against its use for destructive purposes can be devised." However, they took the stand that immediate disclosure of the technical details of the construction of the bomb would defeat rather than ensure the attainment of the desired goal. They appealed to all nations to strengthen the United Nations Organization "to the end of banishing the scourge of war from the earth forever." The statement recommended the formation of a United Nations commission to formulate recommendations for the exchange of scientific information, the outlawing of the atomic bomb, and the establishment of an international inspection service.

**Defenses Against the Bomb.**—Scientists were convinced that there are no defenses against the atomic bomb itself, only against possible carriers. In the event of an atomic bomb race, a nation would have to ring its borders with radar stations on the alert 24 hours a day for an incoming rocket or aeroplane. Anti-aircraft guns would have to be constantly manned and pursuit planes ready to take to the air on a second's warning. But such a defense would have to be 100% effective to serve its purpose. If a city were attacked by 100 rockets carrying atomic bombs and the defenses stopped 99, the 100th would still be sufficient for the total destruction of the city. There would also exist the danger of bombs smuggled in by saboteurs. Scientists believed that in the event of an

atomic bomb race it would be necessary to abandon all large cities and spread the population throughout the countryside so that a bomb might destroy a village but not a city. Factories would have to go underground in deep mines or in tunnels under mountains.

**In Another World War.**—The atomic bomb converts about  $\frac{1}{40}$  of 1% of the mass of U-235 or plutonium into energy. Scientists foresee the possibility of the eventual production of far more powerful bombs, perhaps one converting 2% or 3% of some very common chemical element into energy by some process other than fission. Moreover, they visualize the combination of atomic bombs with many other types of offensive weapons, for example, rockets travelling in the stratosphere with supersonic speeds. They are convinced that the first 24 hours of World War III would see the complete destruction of the principal cities of the contending nations.

**Peacetime Possibilities.**—Physicists believed in 1945 that the development of uranium piles for the generation of power was possible in the near future. The simplest method might be to use the energy to heat water to steam which would operate turbine-generators for the production of electricity. Such piles would need extremely careful shielding to prevent the escape of neutrons and harmful radiations into the surrounding neighbourhood. The ability of such plants to compete with plants using coal would depend upon many factors, including the cost of mining uranium ores, etc.

Many physicists believed that such power plants might be made small enough to be installed in ocean liners but they did not see how they could be made sufficiently small for use in automobiles or aeroplanes. It is important to remember that scientists do not regard uranium fission as the final chapter in the story of atomic energy. On the contrary, it is only the first. It is entirely within the range of possibility that some day methods of releasing atomic energy, other than fission, which will convert larger percentages of the mass involved into energy may be discovered. Should the day come when such nuclear reactions as are known to take place in the stars and the sun can be duplicated, it will be possible to drive an ocean liner across the Atlantic on the atomic energy contained in a glass of water. It is possible, therefore, that in time atomic energy will cause as great changes in the life of the world as did the introduction of steam and the Industrial Revolution.

**Medical and Biological By-products.**—As is well known, the medical profession has long made use of both X-rays and radium in the treatment of many diseases including cancer. After the discovery of artificial radioactivity there was considerable research upon the use of radioactive isotopes both as a means of treating disease and as a tool for biological and medical research. Biologists have long wished for more exact information about the various metabolic processes in the living organism and the rates at which they take place. This is being obtained with the aid of radioactive isotopes which can be traced in the organism by their radioactivity. Biologists speak of such experiments as "tracer experiments." Radioactive forms of carbon, phosphorus, sodium, potassium, iodine, iron, etc., have been used in such experiments. The importance of uranium fission to the biologist and medical man comes from the fact that the fission fragments are highly unstable, undergoing many radioactive changes before they settle down into stable isotopes. The process, therefore, may put a greater volume of radiation and a greater variety of radioactive isotopes at the command of the biologist and medical man. This is bound to lead to many advances in biology and medicine. One hope is that a radioactive isotope may be found which is specific for cancer tissue; that is, an isotope which when taken into the organism will settle only in cancer tissue. Such a discovery might prove the cure for many types of cancers.

**The Years Ahead.**—The knowledge of atomic energy in 1945 may be compared with the knowledge of electricity in the time of Benjamin Franklin. Franklin proved that the destructive lightning bolt was electricity, but man at that time had at his disposal only the feeble static electric machine. There seems no reason to suppose that the conquest and utilization of atomic energy will not duplicate the history of electricity. (See also CHEMISTRY; METALLURGY; PHYSICS.)

**Attlee, Clement Richard** (1883– ), British statesman, leader of the Labour party and prime minister, was born in London of middle-class parents. After attending Haileybury college, Hertfordshire, and studying modern history at University college, Oxford, he lived in the East End of London, studying social conditions and earning his living as a docker. He joined the Socialists, was admitted as a barrister to the Inner Temple (1905) and in 1913 became a lecturer in social science at the London School of Economics, a post which, with five years' interruption for war service, he held until 1923. Returning from the war with the rank of major, he went back to London politics, being elected mayor of Stepney in 1919 and M.P. for Limehouse in 1922. After a brief term of junior office in the first Labour government, he went to India in 1927 as a member of the Simon commission. In the second Labour government (1929–31) he again held office, first as chancellor of the duchy of Lancaster, then as postmaster general. Having become deputy leader of the La-

bour party in the house of commons after the defection of Ramsay MacDonald in 1931 and leader after the death of Lansbury in 1935, he remained leader of the opposition until he joined Winston Churchill's National government in 1940, first as lord privy seal and from 1942 as deputy prime minister and temporarily secretary of state for the dominions. The victory of the Labour party in the general election of July 1945 automatically gave to Attlee the succession as prime minister. Two days after his appointment, having announced the senior appointments in his new government, he flew to Potsdam to complete the discussions of the Big Three in Churchill's place. In November he took the initiative in arranging a meeting at Washington with President Truman and Prime Minister Mackenzie King, the outcome of which was a joint plan for international control of the exploitation of atomic energy. (H. W. At.)

**Australia, Commonwealth of.** A self-governing member of the British Commonwealth of Nations, situated in the southern hemisphere between longitudes 113° 9' E. and 153° 39' E. and latitudes 10° 41' S. and 43° 39' S.; national flag, a blue ensign, with the Union flag in the quarter and six white stars in the field. Language, English. Religion, Christian (census 1933: Anglican 2,565,118; Roman Catholic 1,161,455; Presbyterian 713,229; Methodist 684,022; other Christians 603,914). Ruler, King George VI; governor general in 1945, the duke of Gloucester; prime minister, Joseph Benedict Chifley.

**Area and Population.**—Area 2,974,581 sq.mi.; pop. (est. June 30, 1944) 7,306,637. Chief cities (pop. Dec. 31, 1943): Canberra (capital) (12,200); Sydney (1,398,000); Melbourne (1,170,000); Adelaide (362,500); Brisbane (370,500); Perth (263,000); Hobart (70,800); Newcastle (120,000).

**History.**—*The Political Scene.*—Australia's great wartime prime minister, John Curtin, died on July 5, 1945. His successor, Joseph Benedict Chifley, aged 60, a former engine driver in the New South Wales state railway department, was sworn in as Australia's 16th prime minister on July 13. The most important and controversial legislation laid before parliament during the year was the banking bills and air lines bills. The former consisted of two separate bills, one providing for the regulation of the banking system and the other extending the functions of the Commonwealth bank. The banking bill was designed to secure the following objects: (a) to provide a legal framework uniform throughout Australia for regulating the banking system; (b) to safeguard depositors of banks from loss; (c) to provide for the co-ordination of banking policy under the direction of the Commonwealth bank; (d) to control the volume of credit in circulation, and bank interest rates; (e) to mobilize and provide machinery for the control of foreign exchange and the gold resources of the Australian economy. The main purposes of the Commonwealth Bank bill were, in short: (a) to strengthen the central banking functions of the Commonwealth bank; (b) to ensure that the financial policy of the Commonwealth bank should be in harmony with the main decisions of government policy and in the interests of the people of Australia; (c) to ensure the development and expansion of its general banking business by active competition with the trading banks; (d) to return control of the Commonwealth bank to the governor, assisted by an advisory council; (e) to assist developing small industries and enable the people to secure homes.

In July the Australian National Air Lines bill was introduced by the air minister. It provided that all interstate air lines should be nationalized and controlled by a commission which would have power to acquire compulsorily aircraft and other property (excepting land) and would be empowered to impose a fine up to £500 (\$1,600) for any person establishing or operating

FUNERAL SERVICES for Prime Minister John Curtin of Australia who died at Canberra on July 5, 1945. Mr. Curtin became leader of the Labour party in 1935 and prime minister in Oct. 1941.

a public air transport service in competition with the commission.

The bill met with severe criticism from many quarters but the government view was that the public ownership of air navigation was comparable with the existing government-controlled postal and railroad services.

Another important measure passed by parliament during 1945 was the Life Insurance bill which appointed an insurance commissioner with wide powers to investigate the affairs of companies and compelled some companies to improve policy holders' benefits and empowered the government to set up an insurance office if and when it was thought to be in the public interest. Among social legislation passed were bills increasing the rate of child endowment from 5s. to 7s. 6d. and increasing old age pensions from 27s. to 32s. 6d. a week. Bills were also passed providing war gratuities of £3 15s. for each month of overseas service and 15s. a month for home service after the outbreak of war with Japan. Gratuities were to be payable five years after the war and carry interest at the rate of 3½%.

As a memorial to President Roosevelt the commonwealth parliament decided that a special wing of the national library at Canberra should be dedicated to him and that over the entrance should be inscribed "The Franklin D. Roosevelt Library of American Literature."

**External Affairs.**—Diplomatic appointments announced during 1945 were: Lieut. Col. Roy Hodgson, minister to France; Alfred Stirling, high commissioner to Canada; Lewis R. MacGregor, minister-at-large to South America (with headquarters in Brazil).

Australia was represented at the San Francisco conference by the deputy prime minister, F. M. Forde, and the minister for external affairs, Dr. H. V. Evatt, both of whom had previously visited London to take part in discussions with other members of the British Commonwealth of Nations. In September Dr. Evatt again visited London to represent Australia on the council of foreign ministers.

**Public Finance and Economic Affairs.**—Disastrous drought conditions throughout the eastern and southern states during 1944 and the early months of 1945 were reflected in agricultural and pastoral returns. Wheat stocks in March 1944 amounted to 6,360,000 short tons but by the end of the 1945 season they had fallen to 180,000 short tons. In 1944 meat production was 1,160,000 short tons compared with 1,080,000 short tons in 1945. The wool clip for 1944-45 was high considering weather conditions with an outturn of 3,123,000 bales, but was not expected to exceed 2,800,000 for 1945-46. Good rains in mid-1945 re-

lieved the situation and every effort was made to achieve a maximum acreage of grain for the 1945-46 season.

Chifley, prime minister and treasurer, introduced the budget for 1945-46 on Sept. 7, 1945. He took the opportunity of making a brief review of war finance, revealing for the first time the main heads of war expenditure for the years 1939-45, which reached the total of \$6,755,200,000. Of this amount 34% was provided from taxation. Of the balance, \$2,870,400,000 was raised by public war loans; \$169,600,000 from war savings certificates; \$25,600,000 from interest free loans and \$1,372,800,000 from treasury bills and the use of treasury balances. Estimated war expenditure during 1945-46 would be \$1,152,000,000 compared with \$1,472,000,000 in 1944-45. Immediately after Japan's surrender action was taken to eliminate all but the most essential expenditures, but expenditure for pay and allowances would not show any reduction since, after discharge, members would receive deferred pay and be granted war service leave on full pay. Expenditure for purposes other than war and repatriation was estimated at \$423,648,000. \$1,088,000,000 of the total expenditure would be provided from revenue and the balance of \$486,400,000 from public loans. The chief feature of the taxation proposals was the decision to impose a social services tax of 1s. 6d. in the £ on taxable income. Income tax, however, was to be reduced from Jan. 1, 1946, so that the combined charge on individuals for income tax and social services would be on the average 12½% lower than for 1945. Certain concessions were also provided for in sales tax.

The government's policy during the transition period from war to peace was laid down under two heads. Internally every possible effort was to be made to avoid potential inflation by restoring peacetime production as quickly as possible. Many wartime controls had already been removed and a secondary industries commission set up to assist manufacturers in preparing plans for reconversion. On the other hand, price control was to be continued. Externally, Australia faced an acute shortage of dollars, and would be forced to exercise great care in the expenditure of other foreign exchange as well. It was likely that import requirements would exceed overseas earnings; hence the government was to maintain the machinery of exchange control and import licensing during the transition period.

**Education.**—In 1939: state schools 9,940; average attendance 744,095, teachers employed 31,199; private schools 1,863, average attendance 219,171, teachers 11,496; technical schools 94; total enrolment 101,155, teachers 3,276; business colleges 122, total enrolment 24,337, teachers 727; universities 8, total enrolment 14,236.

**Banking and Finance.**—Revenue (actual 1944-45) \$1,098,950,000; (estimated 1945-46) \$1,088,909,000; expenditure (actual 1944-45), ordinary \$478,291,000; defense \$1,471,987,000; estimated (1945-46), ordinary \$422,400,000; defense \$1,152,000,000. Public debt (June 30, 1944) \$7,573,945,000; notes issued (June 30, 1945) \$596,684,000; gold and sterling reserve (June 30, 1945) \$162,745,000; exchange rate £A1=319.8 cents U.S. (for purpose of converting statistics the figure of £A1=320.0 cents U.S. has been used).

**Trade and Communication.**—Overseas trade 1944-45 (civil merchandise): imports \$256,093,000; exports \$273,740,000. Communication and transport: (1941) roads, total mileage c. 455,000 mi.; railways open to traffic (1942-43) 27,223 mi.; airways (1942-43), distance flown 7,517,000 mi.; mails carried 1,660,000 lb.; motor vehicle registrations (March 31, 1945): cars 502,498; commercial vehicles 287,367; cycles 55,547; wireless receiving set licences 1,465,501; telephones, number of lines, 571,825.

**Agriculture, Manufacturing, Mineral Production.**—Production (in short tons): wool (1944) 582,000; wheat (1943-44)

3,285,000; oats (1943-44) 350,000; barley (1943-44) 190,000; maize (1943-44) 167,000; cane sugar (1943-44) 582,000; butter (1943-44) 175,000; gold (1944) 657,028 fine oz.; coal (1944) 15,075,000; manganese ore (1942) 10,107; silver lead ore (1942) 289,198; zinc and concentrates (1942) 315,875. Total value of production (1941-42): pastoral and dairying \$686,243,000; mineral \$132,022,000; manufacturing \$980,563,000. Labour and employment: employment in factories (1928-29=100) (Feb. 1945) 166.0; number (Feb. 1945) 717,000; unemployment (trade union returns) (Feb. 1945) 1.1%. Total output of factories (1942-43) \$2,721,115,000. (See also NEW GUINEA.) (W. D. MA.)

**Australia, South:** see SOUTH AUSTRALIA.

**Austria.** A republic in central Europe, area 32,369 sq.mi.; pop. (1934) 6,760,233 of whom more than 90% were Roman Catholics. In March 1938 the republic was annexed by Germany as a first step in Germany's plan for the domination of Europe. By the occupation of Vienna the aggressive militarism of Germany gained a strategic position from which the Danubian basin, the Balkans and even Italy could be economically and politically controlled.

In an effort to avoid such a threat to the security of Europe, the United States, the soviet union and Great Britain pledged in Moscow in Nov. 1943 the restoration of the independence of Austria.

With the defeat of Germany in 1945, Austria was occupied by the soviet union, U.S., Britain and France, which set up an Allied council to establish an independent freely elected Austrian government. The country within its 1937 frontiers was divided into four zones: the provinces of Lower Austria and of Burgenland and the northern part of Upper Austria formed the Russian zone; the southern part of Upper Austria and the province of Salzburg, the U.S. zone; the provinces of Tirol and Vorarlberg, the French zone; and the provinces of Carinthia, including Ost-Tirol, and of Styria, the British zone. Similarly, the city of Vienna was divided into four zones. The Allied council and the inter-Allied governing authority of Vienna consisted of the ranking officers of the four participating nations. (See map of Zones of Allied Occupation of Germany and Austria, 1945, in the article GERMANY.)

As soon as Vienna was liberated and occupied by the Russians, a government was set up there, a coalition of the Social Democrats, the communists and the Catholic People's party. Dr. Karl Renner, a veteran Socialist leader, became chancellor. The communists, out of proportion to their actual strength, held the important cabinet posts of the interior and of education. By the end of Sept. 1945 a meeting of representatives of the various diets, meanwhile established in the provinces, was called together in an effort to broaden the Renner cabinet. As a result of the meeting the Austrian government was recognized by the Allies, and elections were held on Nov. 25. All except former members of the National Socialist party were allowed to participate in the election. In spite of the exclusion of former nazis, the elections resulted in a crushing defeat of the communists and in a victory of the conservative People's party. Of the 165 seats of the national assembly, 85 seats went to the People's party (1,574,537 votes), 77 seats to the Social Democrats (1,420,562 votes) and only 3 seats to the communists (175,471 votes).

As a result of these elections, Leopold Figl, the leader of the People's party, formed a new coalition cabinet with himself as chancellor. Dr. Renner was elected president of the Second Austrian republic on Dec. 20, 1945.

Austria's economic situation was extremely difficult. It was not helped by the fact that the Russian occupation forces dis-

THE STATE OPERA HOUSE on Vienna's Ringstrasse, showing part of the extensive damage sustained in the fighting prior to the city's liberation by Russian troops on April 13, 1945

mantled and removed many of Austria's important industrial undertakings, claiming them as part of German reparations. Among these industrial objects claimed by Russia were the important oil wells of Zistersdorf which had been greatly expanded under German occupation. The food situation in Austria, which was much worse than that in Germany, was alleviated by the U.N.R.R.A.

The Austrian government claimed the return of the German-speaking parts of Austrian South Tirol from Italy, which Italy had annexed after World War I. South Tirol, of strategic importance to Italy, was ethnographically and economically of vital importance to Austria. (H. Ko.)

**Automobile Accidents:** see ACCIDENTS; INSURANCE.

**Automobile Industry in Reconversion.** The year 1945 in the United States automotive industry was a year of reconversion from nearly 100% war production to peacetime activities.

The year began with war production at a rate close to the peak of the entire World War II period due to the stimulus given by the German break-through at Ardennes. The relative emphasis on production of the various types of weapons and equipment had changed considerably at the end of the war as compared with the beginning.

From Jan. 1, 1945, to V-J day, Aug. 14, when nearly all war contracts were cancelled, approximately \$5,400,000,000 worth of war articles were delivered by the automotive industry to the U.S. and its Allies.

A comparison of the proportion of deliveries of each product group during 1945 and during the first quarter of 1942 is given in Table I.

Table I.—Comparison of Percentages of Deliveries of War Products, During 1945 and the First Quarter of 1942

	1945	1st Quarter 1942
Aircraft, aircraft subassemblies and parts . . . . .	40.8	22.8
Military vehicles and parts . . . . .	28.0	49.8
Tanks and parts . . . . .	15.8	6.8
Marine equipment . . . . .	5.2	4.9
Guns, artillery and parts . . . . .	2.6	9.5
Ammunition and components . . . . .	3.7	3.8
All other war products . . . . .	3.9	2.4
Total . . . . .	100.0	100.0

Above: AN AUSTIN 4-door sedan is lowered onto a N.Y. pier on its arrival from Liverpool in July 1945. It was the first British postwar model sent overseas and marked the reopening of trade between Great Britain and the U.S.

Above: STUDEBAKER CHAMPION, one of four body types in the series being produced for the postwar market at South Bend, Ind., during the latter part of 1945

Left: NEW FORD Super de Luxe cars starting to roll off an assembly line in Detroit, Mich., in Aug. 1945

Right: NASH "600" postwar car in the low price field, in production at Detroit, Mich. These cars were the first built by the Nash-Kelvinator Corp. after Jan. 1942

As World War II ended in 1945 it will be of interest to summarize the contributions of the automobile industry in the production of armaments during the war period. From Sept. 1, 1939, to the end of 1945, the U.S. automotive industry delivered nearly \$30,000,000,000 in war products, in the following classifications.

Table II.—Values and Percentages of Deliveries of Various War Products, Sept. 1, 1939, to Dec. 31, 1945

	Total Values	Per Cent
Aircraft, aircraft subassemblies and parts . . . . .	\$11,244,857,000	38.8
Military vehicles and parts . . . . .	8,591,143,000	29.7
Tanks and parts . . . . .	3,781,356,000	13.1
Marine equipment . . . . .	1,951,658,000	6.7
Guns, artillery and parts . . . . .	1,589,841,000	5.5
Ammunition and components . . . . .	907,535,000	3.1
All other war products . . . . .	903,610,000	3.1
Total . . . . .	\$28,970,000,000	100.0

Such huge dollar figures can, perhaps, be better visualized in terms of units, to the extent that unit figures were available in 1945. From Sept. 1, 1939, to Dec. 31, 1945, the U.S. automotive industry delivered to the U.S. government and the United Nations the units shown in Table III, in addition to munitions and miscellaneous war products not available in terms of units but shown in Table II in terms of dollars.

Table III.—Units of Deliveries of War Products from Sept. 1, 1939, to Dec. 31, 1945

Kind of Products	Units
Guns and artillery	
Carbines . . . . .	3,386,570
Machine guns . . . . .	1,439,810
Anti-aircraft . . . . .	156,100
Other types . . . . .	848,500
Total . . . . .	5,830,980
Engines	
Aircraft . . . . .	418,300
Tank . . . . .	161,230
Marine . . . . .	166,450
Total . . . . .	745,980
Military truck engines . . . . .	3,200,000
Total engines . . . . .	3,945,980
Combat vehicles	
Tanks . . . . .	48,750
Amphibian tanks . . . . .	5,100
Self-propelled artillery carriages (tank type) . . . . .	23,750
Armoured cars and other gun carriages . . . . .	113,560
Total combat vehicles . . . . .	191,160
Military vehicles	
Jeeps (included with military vehicles) . . . . .	2,600,000
Military trailers . . . . .	659,031
Total . . . . .	578,000
Complete aeroplanes	
Bombers . . . . .	16,035
Fighter aeroplanes . . . . .	5,800
Total . . . . .	21,835
Gliders . . . . .	4,288
Torpedoes . . . . .	2,000
Buzz bombs . . . . .	2,000
Gyrocompasses for navy . . . . .	5,500

This huge volume of fighting equipment produced by the automotive industry for the armies, navies and air forces of the United Nations was in no small measure expedited by the industry's special wartime organization, the Automotive Council for War Production. Through its efforts, advances in technology, improvements in plant layout, methods of saving or substituting for scarce materials, ways of reducing manpower requirements and information on available idle machine tool capacity were exchanged and made known to other manufacturers, so that victory might be achieved sooner than if no such co-operative efforts were undertaken.

Several months before the end of World War II, plans for quick reconversion to peacetime production were worked out in conjunction with government agencies so that the necessary paper work, clearing of plants of government-owned equipment and materials in process could be accomplished in the shortest possible time. This was followed by the making of plans by individual companies for the speedy acquisition of new machine tools to replace those worn out in war production or sold to other manufacturers of war products, the expeditious rearrange-

ment of company-owned machine tools and equipment and reconstruction of final assembly lines. This prereconversion planning enabled manufacturers to make the transition from war production to peacetime activity much more smoothly and quickly than otherwise would have been possible.

Shortly after the defeat of Germany the War Production board curtailed or cancelled some of the war contracts held by the various passenger car manufacturers, thus making possible a resumption of civilian automobile production on a small scale, while, at the same time, continuing production on those war contracts required to defeat Japan. Quotas of 241,916 automobiles during the six-month period ending Dec. 31, 1945, and 449,102 during the three-month period ending March 31, 1946, were allotted to the various manufacturers in proportion to prewar output but modified so as to take into account practical minimum operating rates. The total allotment of cars was limited by the amount of steel and other raw materials available in excess of war requirements and other necessary civilian articles scheduled for production.

Manufacturers made considerable progress on the partial reconversion, and in fact one company had produced several hundred automobiles at the time Japan capitulated and nearly all war contracts were cancelled. The cessation of nearly all war activity in the automobile plants made it necessary to begin physical reconversion over again, on a 100% basis, utilizing as much as they could of the partial reconversion under way.

Thanks to the timely planning for reconversion, the arrival of the war's end found the automobile plants and the government contract termination agencies prepared to meet the challenge with a minimum of confusion.

The huge volume of paper work involved in contract termination and settlement was almost completed by the end of 1945. The physical reconversion of the plants was achieved with equal expedition.

Despite this skill in the handling of the reconversion problems, a number of other factors arose to block achievement of the civilian production schedules planned shortly after the defeat of Japan for the rapid acceleration of new passenger car and truck construction. A survey by the U.S. War Production board indicated that passenger car manufacturers in mid-August 1945 had planned to turn out 500,000 new cars before Jan. 1, 1946. Actually only about 75,000 were built, averaging 22 cars for each of the 33,000 dealers in the U.S. But some manufacturers succeeded in turning out only a few hundred cars toward the end of the year, not enough to supply all their dealers with cars for display purposes.

Reasons for this lag in resumption of production on an increasing scale were to be found in shortages of materials such as glass and textiles; interruptions in the supply of components such as wheels, transmissions, gears, bearings, because of strikes in the supply plants; and work stoppages in the final assembly plants of passenger car manufacturers.

Reconversion of truck manufacturing plants was a relatively simple task compared with that of automobile and their body plants which literally had been torn apart for war production. Truck plants in the main, except for the combat vehicles produced in some plants, produced military vehicles which were similar to the civilian vehicles turned out prior to World War II. The problems concerned primarily termination and settlement of war contracts for work in process and inventories of materials that could not be used in civilian vehicle production. The physical alteration of the plants was negligible.

Even before the European phase of World War II ended, the War Production board had scheduled a relatively large number of civilian trucks for production in 1945. When Japan capitulated civilian truck output was well under way, but sched-

ules could not be achieved because of shortages of certain components such as transmissions, engines and axles.

A total of 315,000 civilian trucks was produced during 1945, in addition to the 353,000 military vehicles going to the armed services. Shortages of components because of strikes in parts-supplying plants limited production to 50% of what otherwise could have been built during the last few months of the year.

Civilian replacement parts production was continued throughout the war at a rate adequate to take care of the demand for essential replacement parts. At the war's end production increased moderately, making it possible to maintain service on the 30,000,000 aged motor vehicles still in operation.

Employment in the automotive industry was maintained on a higher level after V-J day than was anticipated earlier in 1945. The low point was September with a total of 423,000 production workers as compared with 693,000 in January, the peak month of the year. Employment declined steadily from January to September and then turned upward with 454,000 in October, the latest month for which official figures were available at the close of the year. Strikes in progress at the end of the year probably reduced employment below the September level.

Aggregate registrations of passenger cars in the U.S. totalled approximately 25,350,000 during the year ending Dec. 31, 1945. This is 4,157,000 below the highest prewar year 1941, and only 222,849 lower than 1944. New cars sold from inventories to consumers after Feb. 10, 1942, when production was discontinued, were 532,810, so that the total number of passenger cars scrapped during the war was in excess of 4,690,000 units. This large decrease in consumer inventories of rolling stock and the advanced age and generally decrepit condition of cars remaining pointed to a potential market such as the industry had experienced in no other period of its 50 years of existence.

Total truck registrations at the end of 1945 were 4,650,000, reflecting a gain of 137,000 units over the previous year, but a loss of 226,000 units from the prewar peak of 4,876,000 trucks

in 1941. One reason for the small decrease in trucks in use during the war was the conversion of passenger cars to commercial vehicles by making alterations of the bodies; another reason was the salvage of trucks from auto graveyards; and a third reason was that new civilian trucks were produced in limited volume throughout the war period. The total scrappage of motor trucks in use in the U.S. during the war period, from 1941 to 1945, was probably about 850,000 units. This estimate is arrived at by adding the total number of new trucks allocated to users in the U.S. from March 9, 1942, to Sept. 30, 1945, of 505,454 units, and the estimated retail sales during the last quarter of 1945, of 120,000 new trucks, to the reduction, of 226,000, in total registrations below 1941. The severe wear during the war and the above-normal average age of trucks in use indicated a potential postwar market greater than any other peacetime period. (See also BUSINESS REVIEW.)

**Automobile Insurance:** see INSURANCE.

**Aviation, Civil.** After more than three years of war, during which all efforts were directed toward victory over the axis powers, U.S. civil aviation girded itself for the transition from war to peacetime operations. Although the task ahead was tremendous, aviation, looking back on its wartime achievements, could face the future with confidence.

The aviation manufacturing industry had repeatedly surpassed production schedules that at the time of announcement had seemed fantastic. After the outbreak of World War II, it had produced 304,705 military aircraft having an airframe weight of 2,817,736,000 lb. and a value of \$44,764,000,000. Commercial air lines, in the face of losses of personnel and equipment, not only continued to better their performance records in commercial operations, but in addition conducted contract operations of staggering proportions for the armed forces, speeding military personnel and supplies to all parts of the world. During the first 11 months of 1945 U.S. carriers in contract services flew 100,544,961 transport miles, 1,751,763,336 passenger miles and 399,928,428 ton miles. With the completion of the major part of the direct war operations in the early

HULL of the "Hughes Hercules," giant cargo seaplane under construction at Culver City, Calif., in 1945. Its specifications included eight engines of 3,000 h.p. each, wing-span of 320 ft., top speed of about 218 m.p.h., and capacity as a transport of about 750 persons

C-82 "PACKET," twin-engine Fairchild cargo transport first produced in 1945, is shown with its huge rear doors open for loading. Its freight capacity is 9 tons, or 88% of a railroad boxcar, and it features square cargo space and a level floor at truckbed height

part of 1945 it was revealed that in the course of those operations the air lines had flown 8,000,000,000 passenger miles and 850,000,000 cargo ton miles. The distance travelled was the equivalent of 26,000 trips around the globe at the equator.

Even private flying had contributed its share. Private pilots formed the nucleus of the Civil Air Patrol which did valuable work in coastal patrol, courier service and search flights; civilian pilots, through the operation of flying schools under contract to the army, trained hundreds of thousands of cadets for the air forces; women contributed their share by serving as pilots in the ferrying of military aircraft.

**International Air Transport.**—Despite extensive reductions in service, the army's air transport command, with its network of routes covering the world like a gigantic spider web, remained the largest international air transport operator. However, the commercial air lines, already familiar with the operations as a result of their war services, moved rapidly to fill the gaps left by the withdrawal of the army organization.

During 1945, U.S. flag lines carried approximately 460,000 revenue passengers for an estimated 493,000,000 revenue passenger miles on their international routes. Revenue miles flown were estimated at 32,000,000 and ton miles of mail and cargo were 4,625,000 and 8,336,000, respectively.

The pattern of postwar operations emerged when three air lines, Pan American Airways, American Airlines Overseas and Transcontinental and Western Air, were authorized to fly the Atlantic in scheduled commercial service. Operation of those routes was to link the United States by air with the principal centres of Europe, North Africa, the middle east and India. The Atlantic extensions raised the total international certificated route mileage of U.S. carriers to approximately 106,000 as compared with 57,804 in 1940.

By the end of 1945 P.A.A. and A.A.O. were operating daily flights each way between the U.S. and the British Isles and plans were underway for a steady extension of service over the entire

length of the routes. Although T.W.A. had not inaugurated service, a preview flight had been made and operation to Paris was expected to begin early in 1946. P.A.A. had dispatched survey flights preparatory to opening its India service and reopening its Pacific routes to the orient and Australasia.

In all the far-flung international operations, only four accidents occurred during the year. These resulted in two passenger deaths for a passenger fatality rate of 3.44 per 100,000,000 passenger miles. Proof of the maturity of the international service was given when one of the large insurance underwriting groups announced that passenger insurance could be obtained for travel on U.S. international lines to any part of the world at the same rates prevailing for domestic flights.

**Domestic Operations.**—Following the pattern of prior years, the domestic air lines again broke all previous traffic records. On the basis of official reports for the first ten months of the year, estimated revenue passenger miles flown totalled 3,525,619,866, an increase of 56.9% over the 2,246,894,489 revenue passenger miles in 1944. Revenue miles increased 51.9% from 144,240,440 in 1944 to an estimated 219,169,459 in 1945. Revenue passengers were estimated to have numbered 6,621,842 in 1945 as against 4,575,716 in 1944.

Mail, cargo and express hauled likewise showed substantial increases. During 1945 ton miles of mail amounted to 72,231,126 as compared with 51,143,837 in 1944, an increase of 41.2%. Comparative figures for ton miles of express and cargo carried during the two years were 24,505,243 in 1945 and 17,694,988 in 1944. This represented an increase of 38.4%.

Operating revenue for the first nine months of 1945 reached a total of \$158,231,842, the revenue being comprised of \$121,588,822 passenger, \$25,289,655 mail, \$8,575,623 express and freight and \$2,777,742 all other. During the same period of 1944, total operating revenue amounted to \$114,295,278. The total for 1944 consisted of passenger revenue of \$82,656,216, mail revenue of \$23,643,232, express and freight revenue of \$5,833,263 and other revenue of \$2,162,567.

Although operating expenses increased from \$86,909,815 in 1944 to \$125,464,485 in 1945, the great increase in gross operat-

THE "CHAMPION," low-priced private plane produced by Aeronca Aircraft Corp. during 1945. Its small size recommended it to sportsmen or miners for landing in inaccessible places

ing revenue permitted the carriers to show net operating revenue in 1945 of \$32,767,357 as compared with a net operating revenue in 1944 of \$27,385,463. For the 12 months ending Sept. 1945, the carriers had a total operating revenue of \$204,864,716 made up of \$155,373,296 passenger revenue, \$34,963,820 mail revenue, \$11,048,654 express and freight revenue and \$3,478,946 all other revenue. Operating expenses during the same period amounted to \$163,076,695, leaving a net operating revenue of \$41,788,021.

On Dec. 15 the domestic fleet reached a total of 402 transport planes, for the first time exceeding the 359 aircraft on hand at the time of Pearl Harbor. The load factor (percentage of seats occupied) and daily hours of aircraft utilization, both having nearly reached the saturation point during the war declined slightly, although a few individual carriers continued to show increases in both of those categories.

In October all priorities for air travel were abolished, but that move did not bring to an end the large-scale transportation of military personnel. At the request of the army, several air lines in August inaugurated the "Trans-Con" project, a contract service from coast to coast, carrying service men across the U.S. for discharge. By the end of December, 63,376 soldiers had been transported on this operation. Another move designed to speed the movement of returning military personnel was an order by the Office of Defense Transportation in December requiring the carriers to allot 70% of all eastbound seats from the Pacific coast to members of the armed forces.

Passenger fatalities in scheduled domestic operations increased from 50 in 1944 to 76 in 1945; however, as a result of the increase in the scope of operation, fatalities per 100,000,000 passenger miles flown decreased from 2.2 in 1944 to approximately 2.11 in 1945. This represented approximately 47,000,000 passenger miles flown per fatality in 1945 compared with approximately 45,000,000 miles in 1944.

The number of route miles in the domestic transportation network increased by 4,042 in 1945, bringing the total route mileage the air lines are authorized to operate by the Civil Aeronautics board to an all-time high of 66,979. Certificated stops rose in number to 406, with service actually being rendered to 319 and temporarily suspended at the remaining 87. It was estimated that 82% of the entire urban population lived within a 25-mi. radius of the certificated routes and 93% within a 50-mi. radius.

As 1945 closed there were 581 applications for scheduled domestic service before the Civil Aeronautics board. Of the applicants, 479 proposed to engage in conventional type service, 41 in pickup service and 61 in helicopter service.

**Foreign Air Lines.**—Faced with shortages of equipment and

gasoline, the foreign air lines struggled to rebuild their prewar networks and laid plans for extensive postwar expansion. Although frequency of service was necessarily limited, 1945 saw the reopening of service to most of the major cities of Europe. Even in Czechoslovakia, one of the last countries to be completely liberated, a new state-owned air line had inaugurated service throughout the country.

In England, British Overseas Airways corporation joined the struggle for world air trade. By the latter part of the year, B.O.A.C. had increased service on its England-Australia operation to two round trips per week and, in conjunction with South African Airways, had re-established through service on a weekly basis between the British Isles and the Union of South Africa.

K.L.M., Royal Dutch Airlines, re-established service under contract to the Netherlands government between Amsterdam and Batavia on a bi-weekly schedule. Losing no time in entering the international race, K.L.M. requested approval by the Civil Aeronautics board of its proposed routes between Amsterdam and New York and between Miami and Curaçao. Applications for transatlantic service were also filed by three Scandinavian air lines representing Norway, Sweden and Denmark who announced their intention of pooling resources for the operation.

The French air lines continued the expansion of their services in Europe and the French African possessions and laid plans for an operation to South America. Russia revealed that transport services had been resumed throughout most of the country and announced a proposed service extending east and west from Russia to the United States. S.A.B.E.N.A., the Belgian company which had concentrated its wartime efforts in the Congo, inaugurated a service from Africa to Europe.

In the western hemisphere, Trans-Canada Air Lines for the first time made its transatlantic service available to the public, although priorities still limited travel to passengers on essential business. Paced by development in Mexico and Brazil, the extensive network of air routes in Latin America continued to expand. By mid-year the approximately 50 air lines operating as common carriers in Central and South America were flying a total of more than 125,000 unduplicated air miles.

The French government assumed control of all air lines in that country during the year, and the British labour government disclosed its intention of nationalizing all British scheduled air transport services and all airfields needed for scheduled operations. Under the plan announced in England, three wholly owned government corporations would be established, one to conduct operations to the United States, the far east and the countries forming the commonwealth; the second to handle services to South America; and the third to direct internal

THE "ENSIGN," All American Aircraft's low-wing two-seat monoplane, first exhibited on Sept. 20, 1945. Designed for private business or recreation flying, it featured a Plexiglass enclosure and a practical cruising speed of 112 m.p.h.

routes and European services. A similar move in Australia was defeated when the high court declared invalid the provisions of a law that would have permitted nationalization.

**Production.**—After rising to the position of the largest industry in the world, the U.S. aircraft manufacturing industry, with the major part of its contracts cancelled after the cessation of hostilities, fell to the 15th or 16th industry in size in the United States by the end of 1945. From a war peak in March 1944 of 9,117 military aircraft with an airframe weight of 88,907,000 lb., monthly production decreased in 1945 to less than 300 planes with an airframe weight not totalling 2,000,000 lb. Cutbacks in production that had already begun at the first of the year turned into an avalanche at V-J day. On a single day in August, contracts totalling \$9,000,000,000 and including 31,000 military aircraft were cancelled. Industry employment which had exceeded 1,000,000 at the beginning of the year reached a low of 146,238 in Oct. 1945.

The number of military aircraft produced in 1945 numbered 47,815 as compared with 96,369 in 1944 and total airframe weight decreased to 540,800,000 lb. from the 1944 figure of 961,121,000 lb. Value of production was almost halved, with the total for 1945 estimated at \$8,320,000,000 as against \$16,339,000,000 for 1944.

**Private Flying.**—Given impetus by the removal of wartime restrictions and the release of thousands of trained pilots from the armed forces, private flying moved forward to a postwar boom of unprecedented proportions. Student pilot certificates issued during 1945 numbered 70,000 as compared with 51,000 in 1944 and only 30,000 in 1939. Private, commercial and air line pilot certificates in effect at the close of 1945 totalled 182,000. This compared with a total of approximately 115,000 in 1944. With the release of surplus small aircraft by the armed forces, the number of registered aircraft in the United States rose from approximately 28,000 in 1944 to more than 37,000 in 1945. However, the demand for personal aircraft still exceeded the supply and at the year's end private plane manufacturers estimated that they had back orders on hand for between 40,000 and 50,000 such aircraft.

**International Organization.**—The plan for international co-operation in civil aviation drawn up at the 1944 Chicago conference began to be executed in 1945 with the setting up in Montreal of the Provisional International Civil Aviation organization. Chosen to head the interim council of the body was Dr. Edward P. Warner, recognized both in the United States and abroad as one of the outstanding figures in the field of aviation. Although much of the initial work of P.I.C.A.O. necessarily consisted of the unspectacular task of establishing a working organization, progress had been made in starting on the important tasks assigned the organization. A substantial amount of work had been done by the statutory committees provided for by the Chicago conference, and at the close of 1945 P.I.C.A.O. announced plans for convening a number of regional conferences on air navigation matters in 1946. The total number of nations who had signed the interim agreement and thereby become members of the P.I.C.A.O. assembly reached 40.

**Government Activity and Aviation Problems.**—Although great progress was made during the year, pressing problems clouded the civil aviation horizon. In the international field several countries remained adamant in their opposition to the broad freedom of the air envisaged by the documents drawn up at the Chicago conference. Negotiations for the right to operate services to and through foreign nations continued to be handled on the basis of bilateral agreements between the countries concerned, and the questions involving rates, frequency of service and quantity of traffic carried remained for future solution. Another cause of worry in the international aviation picture was

the problem of continuing operation of the essential world-wide network of air navigation facilities set up by the U.S. army in the course of its wartime operations.

Other equally important problems faced U.S. aviation. Although all efforts to permit surface carriers to enter into the field of air transportation were blocked during 1945, the problem involved, going to the very heart of the United States postwar aviation policy, showed no signs of having reached a final settlement. Also requiring action were the questions of the shape the feeder-line system of the U.S. should assume, and the degree to which nonscheduled operators should be subject to government economic regulation. Consideration of those matters comprised an important part of the work of the Civil Aeronautics board during the year, and after extensive investigation and hearings both questions were under final consideration by the CAB at the end of 1945.

During the year the CAB completed the important hearings on the applications of U.S. carriers for international service and only those involving service across the Pacific and South Atlantic remained undecided. An important change in the airworthiness requirements for transport aircraft occurred when the CAB eliminated the fixed stalling speed limit previously in effect.

The increased emphasis placed upon private and nonscheduled flying by the Civil Aeronautics administration was highlighted by the appointment of an assistant to the administrator to recommend procedures for the advancement of this type of flying. This was followed by the naming of a private flying advisory committee made up of civilians from many parts of the aviation industry.

In addition to preparing and disseminating information on airport planning, standards and operation, the CAA assumed an important role in the disposition of surplus airports with the announcement by the Surplus Property administration that the CAA would take part in all negotiations for the disposal of such airfields. Aid for veterans, trained in aviation or desirous of entering the aviation field, was undertaken by the publication of surveys of postwar employment prospects in the aviation industry, and by the establishment, in conjunction with the army, of refresher courses to assist qualified army aeroplane and engine mechanics to obtain CAA certificates. FILMS.—*Airplane Changes Our World Map; Airplane Trip; Development of Transportation; Problems of Flight; Theory of Flight* (Encyclopædia Britannica Films Inc.). (G. M. M.)

**Aviation, Military.** U.S. Army.—In 1945 the United States army air forces reached its peak strength of World War II, having 80,083 aeroplanes of all types on Aug. 5, and more than 2,400,000 men and women on March 31. Of the aircraft, 43,284 were combat planes and by the end of May 1945 more than half of these were overseas. Prior to that time the European air forces had successfully completed their mission by driving the luftwaffe from the air and destroying the productive capacity of German industry. In Japan, meanwhile, the very heavy bomber forces were systematically reducing the Japanese manufacturing centres to ashes.

From Jan. 1, until the Japanese surrender on Aug. 14, the A.A.F. flew 678,352 combat sorties, a combat sortie being considered as one aeroplane on one combat mission. Of these sorties 438,192 were against the Germans and 240,160 against the Japanese. This brought the total for World War II to 2,354,124 sorties, 1,692,469 being flown in Europe and Africa, and 661,656 in Asia and the Pacific.

The mission in which the largest number of aeroplanes participated took place on Dec. 24, 1944, when 2,055 bombers and fighters struck behind the German lines in a single co-ordinated

DOUGLAS C-74 GLOBEMASTER, world's largest land plane, was test-flown on Sept. 5, 1945. The 4-engine supertransport has a maximum range of 7,800 mi., a speed exceeding 300 m.p.h. and a useful load capacity of 30 tons. It can circle the globe in 2 stops

attack to relieve the pressure on the ground forces in the Ardennes Bulge.

For an air force to be effective against ground targets, it must have superiority in the air. In gaining this superiority over the Japanese, the A.A.F. had destroyed 10,314 Japanese planes. In return, slightly more than 4,000 army planes were lost against the Japanese. Meanwhile, in gaining air superiority over the luftwaffe, army planes destroyed almost 30,000 German aircraft. During all the European missions the A.A.F. lost 18,418 of its own planes. Beside the battle for the skies and the strategic effort in Europe there was a brilliant campaign being waged in Asia.

In addition to launching its constant attacks on Japan, the very heavy bomber program, using B-29 Superfortresses, continued growing steadily. By the end of the war there were more than 2,800 very heavy bombers, of which more than 1,000 were deployed in the Pacific. With a far smaller numerical strength than that of the medium and heavy bombers, the B-29 forces on Aug. 1 made the most powerful raid of the war by dropping 6,871 tons of bombs on Japanese military and industrial targets. Soon afterward, a single B-29 of the 20th air force dropped an atomic bomb on Hiroshima, and dropped another a few days later on Nagasaki. The Japanese surrendered almost immediately, citing the air-borne atomic bomb as a weapon which could obliterate the Japanese nation. For the first time in history a nation had surrendered without a single enemy landing on its soil. (H. H. A.)

**U.S. Navy.**—The year 1945 found the United States navy with the world's most powerful naval air force. More than 100 carriers—1,171,000 tons of mobile air bases commanded the oceans. This force, capable of putting more than 5,000 planes into the air at once, proved that it not only could hit the enemy with overwhelming strength, but could stay and strike time and time again despite any opposition the enemy put up.

The final phases of the war which led to the capitulation of Japan included two major operations in which naval aviation prepared the way and then supported the landings. They were the invasion of Iwo Jima in February and of Okinawa in April.

Support of the Okinawa invasion consisted first of tactical bombing by carrier planes. The task force struck at airfields on Honshu, Kyushu and Okinawa, itself, to eliminate future air-borne resistance to the landing. In addition they hunted out several of the remaining units of the Japanese fleet and put them out of commission. In a four-day period carrier planes

destroyed 528 enemy planes, damaged 16 surface ships and either destroyed or damaged scores of hangars, factories and warehouses. While supporting the landing operations, the carrier task force knocked down 248 planes with a loss of two U.S. aircraft. The box score for the three-month Okinawa campaign totalled 2,336 enemy planes destroyed with a loss of 557 U.S. aircraft.

Preinvasion air operations had begun against Japan proper before V-J day. From July 10 through Aug. 15 the 3rd fleet attacking the homeland destroyed or damaged 2,804 enemy planes, sank or damaged 1,598 enemy supply ships, destroyed 195 locomotives and damaged 109 more. Industrial targets were also heavily hit. Japan was helpless to resist.

From March 1 to Oct. 1, 1945, 12 new carriers were completed. They included the U.S.S. "Midway," first of three 45,000-ton carriers. Three "Essex"-class carriers and eight escort carriers also joined the fleet.

New fighter planes introduced included the navy's first fighter to employ jet propulsion, the Ryan FR-1 (Fireball). Also announced were the twin-engine Grumman F7F (Tigercat), the compact highly-maneuvrable Grumman F8F (Bearcat), Goodyear's F2G (Corsair) and Boeing's F8B.

Two new land-based patrol planes, the four-engine Consolidated PB4Y-2 (Privateer) and the twin-engine Lockheed PV-2 (Harpoon) met the enemy and proved themselves during the last months of the war.

Disclosure of secret projects developed during the war included target drones, radio controlled and television directed operational planes and guided missiles. Prominent among the last group were the "Glomb" (a 4,000-lb. glider bomb towed behind a navy fighter, which is directed to the target by radio control and television), the "Gorgon" (a jet-propelled missile carried by a bomber and equipped with an automatic target-seeking device) and the "Gargoyle" (a jet-propelled 1,000-lb. armour-piercing bomb which, when released, automatically seeks and collides with a ship target).

Power plant developments included the announcement of the first U.S. designed and developed jet propulsion engine (the Westinghouse 19A and 19B) and the most powerful reciprocating engine yet to be installed in an aircraft (the 3,600-h.p. Pratt and Whitney R-4360).

Indicative of aviation's key role in naval strategy was the United States naval academy's decision to greatly expand the scope of its aeronautical training. As a result of this program, all future naval academy graduates whether they command submarines or shore stations were to be fully cognizant of the possibilities and limitations of airpower. (See also NAVIES OF

THE WORLD.)

(M. A. MR.)

**The World.**—The year 1945 marked the end of World War II. The military archives and industrial records of the enemy nations were captured and examined. For the first time in history it became possible to obtain answers to some of the questions concerning strategic bombing that had been the subject of so much controversy among military strategists. More than that, if possible, the year 1945 answered the many questions that had arisen concerning the most effective utilization of tactical air power. As the year 1945 closed new types of military aeroplanes, utilizing jet and rocket principles, began to make their appearance. They were expected to influence future aerial tactics sooner and to a greater extent than aerial strategy.

**The Air War in Europe.**—The year 1945 began in Europe as the battle of the Bulge entered its final and decisive stages. The luftwaffe made its last great effort on Jan. 1, 1945. There were 800 sorties flown on that day against Allied airfields. There were 127 Allied aircraft destroyed on the ground, and 133 damaged. However, the luftwaffe lost up to 200 aircraft, and that was more than it could stand. Not even the suicide tactics, adopted later in 1945, made the luftwaffe a potent military factor. In the two weeks' period from April 5-19, 1945, the Allied air forces destroyed 3,484 German aeroplanes on the ground and in the air, and thus eliminated the luftwaffe altogether as a military factor for the balance of the war.

The oil and ammunition position of Germany continued to deteriorate in 1945 as the strategic air offensive increased. Altogether approximately 225,000 tons of bombs were dropped on the German oil and armament industries, amounting to 9.3% of the total Allied bombing effort. In Jan. 1945 the production of all types of German military aeroplanes, except jets, was virtually discontinued, for lack of fuel to fly the aeroplanes.

The air offensive against the German transportation system was also continued in 1945. Altogether about 800,000 tons of bombs, or approximately 32% of the whole bombing effort in Europe, were dropped on the German transportation system. The efficiency of the system declined rapidly until it reached a low of 25% of preattack capacity in March. Coal deliveries declined from 25% of normal in February to 4% in April. As a result, the whole German economy, powered by coal, totally

collapsed in 1945.

An objective postattack analysis of the German defeat—which was ordered by the president of the United States, and carried out by a team of prominent civilian experts and industrialists, assisted by the military—reached the following conclusion:

Allied air power was decisive in the war in Europe. . . . In the air, its victory was complete; at sea, its contribution, combined with naval power brought an end to the enemy's naval threat, the U-boat; on land, it helped turn the tide overwhelmingly in favour of Allied ground forces. Its power and superiority made possible the success of the invasion. It brought the economy, which sustained the enemy's armed forces, to virtual collapse. . . . Even if the final military victories that carried the Allied armies across the Rhine and Oder had not taken place . . . the German armies, completely bereft of ammunition and motive power, would have had to cease fighting—any effective fighting—within a few months.<sup>1</sup>

**The Air War in the Pacific.**—The unconditional surrender of Germany on May 7, 1945, sealed the fate of Japan. Allied plans called for increasing the bomb tonnages by four times at the end of 1945 and fivefold by the end of 1946. The land of the "Rising Sun" would have been buried beneath a veritable avalanche of aerial destruction in 1945 and early 1946 if the war had not ended when it did.

The results of the Allied attack on Japanese merchant shipping began to manifest themselves on a large scale in 1945. Japanese merchant shipping, in fact, was reduced from a gross tonnage of 5,000,000 at the beginning of the war to a low of 1,000,000 at the end of the war. Allied submarines sank the bulk of Japanese shipping, but the Allied air forces were sinking Japanese merchant vessels at the end of the war at a rate of about 1,000,000 tons per year. In addition to that, the strategic air forces, as a result of an extensive mining campaign beginning in March 1945, had damaged or immobilized 500,000 tons of Japanese merchant shipping. The blockade was so tight, at the end, that Japanese industry, for all practical purposes, was shut down, and the Japanese people were facing starvation in 1946.

The target systems that were heavily attacked in 1945, aside from merchant shipping, were the Japanese aircraft industry and Japanese industrial areas. The Superfortresses blasted and burned out 30,000,000 sq.ft. of the Japanese aircraft plant areas, mostly in 1945. This was approximately 30.6% of the total area devoted to that industry. In addition, B-29s destroyed two

<sup>1</sup>"The U.S. Strategic Bombing Survey," *Overall Report (European War)*, pp. 107 and 38 (Sept. 30, 1945).

THREE B-29 SUPERFORTRESSES photographed against Fujiyama during a bombing mission over Japan in 1945

vital propeller plants that were responsible for 70% of the output of propellers for combat aircraft. It was estimated that:

The combination of attacks on the aircraft industry and on urban industrial areas denied to the Japanese some 7,200 combat aeroplanes, which, in the absence of bombing, would have been produced by Aug. 1945. . . . It is thought that the damage to the propeller plants alone, without further attack on the aircraft industry, would have reduced Japanese aeroplane production by Nov. 1945, to a rate equivalent to 41% of Jan. 1945 production.<sup>1</sup>

The urban industrial areas that were attacked in Japan in 1945 consisted of the 66 principal Japanese cities. In all, more than 100,000 tons of bombs were dropped on these targets. More than 42% of the urban industrial areas thus attacked were destroyed by Aug. 1945. The number of people killed was estimated by the Japanese to be in excess of 250,000, and the number injured an additional 500,000. In addition, more than 2,000,000 Japanese homes were burned or demolished, and the Japanese themselves estimated that between 9,000,000 and 10,000,000 people were rendered homeless up to Aug. 1945. What the ultimate consequences to the Japanese people might have been had their emperor allowed this weight of attack to be quadrupled and quintupled in accordance with Allied plans is fearful to contemplate.

The hopelessness of the Japanese military situation was recognized by the Japanese in 1945. The prominent Japanese industrialists, military and naval strategists have all expressed their opinions that military air power made it impossible for the Japanese to continue the fight longer than they did. Rear Admiral Takata, deputy chief of military affairs, navy ministry, said: "Of land, sea and air forces, air by a wide margin contributed most to the defeat of Japan."<sup>2</sup> Lt. Gen. Tozoe, chief of staff, Japanese army air force, said, "The B-29s dealt the death blow to Japan proper."<sup>3</sup> Ryoza Asano, president, Nippon Steel Tube company, said, "We industrialists felt that air raids were going to finish the war, believing that Japan could not last until an invasion. Air attack sealed the fate of Japan."<sup>4</sup> Gen. Kawabe, commanding general, Japanese army air forces, said, "One of the biggest factors leading to the surrender was the bombing of the industrial cities of Japan. Our loss in the air lost us the war."<sup>5</sup> Gen. H. H. Arnold, commanding general, U.S. army air forces, said, "Fully recognizing the indispensable

THE LOCKHEED P-80 Shooting Star, newest and fastest jet-propelled fighter of the USAAF, was made public on Aug. 1, 1945. Kerosene-powered by a G.E. gas turbine engine, its speed is more than 550 m.p.h. and its ceiling more than 40,000 ft. At maximum ceiling, its speed approaches that of sound.

contribution of other arms, I feel that air power's part may fairly be called decisive. . . . The fanatical Japanese would never have offered to accept the crushing terms of the Potsdam ultimatum merely because of the odds against them. . . . Yet the Japanese acknowledged defeat because air attacks, both actual and potential, had made possible the destruction of their capability and will for further resistance."<sup>6</sup>

**Heavy and Very Heavy Bombers—Army.**—The aeroplanes that were used to fight World War II were, in a broad sense, the aeroplanes that were designed and developed prior to the outbreak of World War II. No U.S. army aeroplane was ever flown in combat in World War II that had not been designed and developed prior to Dec. 7, 1941. Improvements were made on older models to the point where the last in the series bore only a faint resemblance to the first of the series; but on the whole, the belligerent powers fought World War II with aeroplanes designed and developed between World War I and World War II. Even the German jets that saw combat in 1944 and 1945 were developed and approved for production by the German air ministry in 1938-39.

Both the Fortresses and Liberators had reached journey's end as heavy daylight bombers in 1945. The B-29 had proved itself to be such a superior aeroplane by all standards—speed, performance, range, altitude, firepower, armour, bomb capacity—that it was scheduled to replace the Forts and Liberators in both Europe and the Pacific. The B-29 Boeing Superfortress is powered by four Wright Cyclone R-3350 18-cylinder 2,200 h.p. engines. It has a span of 141 ft. 3 in., length 99 ft., height 27 ft. 9 in., and wing area of 1,736 sq.ft. Its weight is 135,000 lb., speed in excess of 350 m.p.h., a ceiling of more than 35,000 ft., and range of more than 3,300 mi. Stripped down, the B-29 can fly 8,000 mi. nonstop. It can carry a maximum bomb load of up to 10 tons, depending on the mission. Its armament consists of 10 or 12 .50-calibre guns and it is equipped with a General Electric central fire control system. It carries a crew of 11, including the flight engineer.

The XB-36, the Super-Superfortress, is the big daylight bomber of the future. It is the largest bomber aeroplane in the world. This 65-ton giant was expected to be able to take off from a U.S. base and fly nonstop to any place in the world. It develops more horsepower than two B-29s, and its guns are capable of firing 1½ tons of lead and steel per minute. The XB-36 was reported to be 163 ft. long from nose to tail. It carries a crew of 17, including relief personnel, and is even equipped with a small galley for the preparation of hot meals while in the air. The XB-36 is powered by six Pratt and Whitney radial, air-cooled pusher engines, each capable of producing in excess of 3,000 h.p. The big bomber is equipped with a retractable landing gear consisting of two single main wheels and a nose wheel. The wheels are the largest ever constructed, 110 in. in diameter. A single tire, weighing 1,500 lb., would support a fully loaded B-29. The XB-36 will fly 6 mi. above the earth as routine, and Tokyo to Washington nonstop flights will be normal.

Of the British bombers of the heavy type, the Lancasters and Halifaxes carried the main burden of the war. Both ships are in the 65,000-lb. class; both had maximum ranges of above 2,000 mi.; and both could carry bomb loads normally of up to 14,000 lb. The newest type British night bomber is in the 75,000-lb. class, the Lincoln I. It is powered by four Merlin 85 engines, has a span of 120 ft., length 76 ft. 2 in., height 19 ft. 6 in. and wing area of 1,408 sq.ft.

**Medium Bombers—Army.**—In the medium bomber field the outstanding aeroplanes in 1945 were the U.S. B-25 Mitchells, B-26 Marauders, A-26 Invaders and XB-42 Mixmaster; and the British Mosquitoes. B-25 Mitchells were used extensively by

<sup>6</sup> Arnold, H. H., Third Report ops. cit., p. 33.

Above: A B-17 FLYING FORTRESS unloading high explosive and incendiary bombs over Nuernberg, Germany, during a mission of the U.S. 8th air force on Feb. 20, 1945. More than 900 B-17s and about 700 fighters, flying through cloud, aimed for the railroad station and yards below

Above: JAPANESE suicide plane, already ablaze from a direct hit, passes over an escort carrier whose gunners remain poised for fresh attacks. Piloted by the "volunteer" Kamikaze corps, these craft were used in crash dives on U.S. ships in the Western Pacific in 1945

Below: THE M-1, new U.S. navy blimp, featuring a long 3-unit car so integrated to the envelope above as to provide maximum freedom of motion. Blimps were used for coastal patrol duty during 1945

VULTEE B-32 DOMINATOR, new 4-engine heavy bomber used in the Far East Air Forces was first publicized on July 30, 1945. The tail, which is 32 ft. high, allows great manoeuvrability and stability; the fuselage measures 83 ft. Bomb bays adjoin, and can carry longer bombs than the B-29

the U.S. in the Pacific theatre. They were the most versatile of the U.S. types, and were used for strafing, parachute frag bombing, skip bombing, torpedo dropping and medium altitude bombing. The B-26 Marauder was used extensively in the European theatre of operations. The A-26 Douglas attack bomber, the Invader, was a late development of the A-20. The A-26 was superior to any other U.S. twin-engine bomber at medium altitudes in 1945, and was used operationally in the 5th, 7th, 9th and 12th U.S. air forces.

The XB-42 Mixmaster was a tested but unproved U.S. medium bomber in 1945. It was the first U.S. pusher-bomber to reach the flight test stage in three decades. It has greater speed and range than any other U.S. bomber of its size. The Mixmaster established unofficial speed records in 1945, and has a range of more than 4,500 mi. It weighs about 35,000 lb., and can carry up to 8,000 lb. of bombs. The Mixmaster is powered by two Allison V-1710 engines mounted side by side in the fuselage just behind the crew's compartment in the nose. The propellers are in the rear. The Mixmaster carries a crew of three. The pilot and gunner sit side by side in the nose compartment, and the bombardier is situated in a forward well. The XB-42 has an interchangeable nose to accommodate several forward-firing .50-cal. guns and a 75-mm. gun or a 37-mm. cannon. The wing guns are mounted to fire rearward.

The British Mosquito was on all counts one of the outstanding aeroplanes of World War II and, of course, 1945. This all-wooden monoplane, because of its very high speed and long range was used for practically everything, except day bombing or strafing. It was effective as a light bomber, medium bomber, night fighter, pathfinder and reconnaissance aeroplane.

**Fighters—Army.**—The outstanding battle-tested fighter aeroplanes in 1945 were the U.S. P-47 Thunderbolt, the P-51 Mustang and the P-61 Black Widow; the British Spitfire, Typhoon IB, Tempest V and to a limited extent the Meteor; and the German newer types ME-262, ME-263 and AR-234. The non-battle-tested fighters of note that appeared in 1945 were the U.S. P-80 Shooting Star; XP-81, XP-82 and XP-83; the British Vampire; and three highly unconventional German developments: the Viper, the X-4 and the Rheintochter III.

The U.S. fighters, such as the Thunderbolts and Mustangs, were built primarily for altitude, range and firepower, to enable

them to accompany and defend the heavy bombers on their long missions.

Both the Germans and the Japanese, in the last stages of the war, made certain design changes in their aircraft. The Japanese began to use armour plating and heavier armament, with some sacrifice of range, and the Germans in developing their jets, emphasized the principles of speed, firepower and armour, at the expense of range, which they needed less and less.

The changes came too late, however, to be of any great consequence. Both the Germans and the Japanese had made a mistake in their earlier training programs that eventually proved to be fatal in their air forces. The Japanese mistake was to assume that the supply of pilots was inexhaustible, and that they could be expended lavishly in lightly armoured aeroplanes. The German error was in cutting down on pilot training in a false economy move to conserve supplies of gasoline. As a direct result of these early mistakes, and despite last minute corrective measures, the Allies were always victorious in the final and decisive battles that were fought for supremacy of the skies of Europe and the Pacific.

The P-47 Thunderbolt was an outstanding fighter in 1945. It was extensively used in Europe as a long-range fighter escort, and also as a fighter-bomber. Its outstanding fighter-escort characteristics were long range, great speed at high altitudes, and manoeuvrability. As a fighter-bomber, its chief assets were its general ruggedness, including diving speed and ability to absorb a great deal of battle damage and still continue flight.

The P-51 Mustang was considered by many to be the outstanding fighter aeroplane of World War II, and the year 1945. It has great range, a high rate of speed and climb, plus manoeuvrability and average ruggedness. It thus combines some of the best qualities of the Thunderbolts and Spitfires. The Mustang was also effective when used as a fighter-bomber. It was claimed by many to be the best designed fighter aeroplane for all around use in World War II.

The P-61 Black Widow was the outstanding night fighter of World War II. It was also effective in interception work, as a fighter-bomber, and for reconnaissance. It is armoured, has leakproof tanks and bulletproof glass. Its crew of two or three consists of pilot, radio operator and gunner. The P-61 is equipped with special radar equipment for night flying, detection and identification.

The Lockheed P-80 Shooting Star is a jet-propelled fighter. It did not see any combat duty in World War II. The Shooting Star, however, is powered by a General Electric turbo-jet engine, has a span of 39 ft., length 32 ft., height 11 ft. 4 in., and a weight of 11,950 lb. Its maximum speed is above 550 m.p.h., and it climbs to 35,000 ft. in 13.5 min. Its service ceiling is more than 40,000 ft. Its armament consists of six or more .50-cal. guns in the nose. It is equipped with a pressure cabin, armour, bulletproof glass and a bubble-canopy.

The XP-81 was still in the development stage. Like the navy's Fireball, the XP-81 is a combination jet and propeller aeroplane. The theory was that the propeller-driven engine, which is in the front, can be used to bring the aeroplane up to high speed, and when the point is reached where the propeller loses its thrust efficiency, the jet engine in the rear will be used. Theoretically, the combination seemed to be an ideal solution to the problem of the most effective utilization of both engine types. The XP-81 has a wing span of 50 ft. 6 in., and its fuselage length is 44 ft. 8 in.

The XP-82 twin-fuselage Mustang was designed and developed primarily as a fighter-escort for the B-29s. The XP-82 is, as its name suggests, two P-51H fuselages placed on a single wing. The wing is one-fourth larger than that of the Mustang alone, each fuselage is lengthened by 3 ft., and a large stabilizer

gives the aeroplane a twin-boom effect. In addition to its primary mission, long-range escort, the XP-82 can be used as an interceptor or as a fighter-bomber. A special nacelle is slung under the wing for radar equipment when the aeroplane is used for a night fighter. The XP-82's 14 machine guns, six in the wing and eight more in a package, give it more firepower than any other fighter. It can also carry four 1,000-lb. bombs. The XP-82 is powered by two Packard in-line engines of 1,500 h.p. at 30,000 ft. Adjustable seats in the cockpits make it possible for the pilot and co-pilot to get some rest on long missions.

The XP-83 is a twin-engine jet fighter. Its wing span is 53 ft., length of the fuselage 44 ft. 10 in., and weight 27,000 lb. The XP-83 is expected to have a top speed well in excess of 500 m.p.h., and a ceiling of between 40,000 and 50,000 ft. It is powered by General Electric engines.

The British Spitfire, at the close of World War II and the year 1945, continued to be the best fighter-interceptor in existence. Its excellent rate of climb and high speed at all altitudes, are the outstanding characteristics of the battle-tested Spitfire and what made it the best interceptor-fighter of the war. Though it was used for almost every type of combat flying, from the defense of Britain to short-range reconnaissance and escort work, the range of the Spitfire is far below that of the U.S. Mustang or Thunderbolt. For short-range work, however, the Spitfire could hold its own against almost any aeroplane in existence.

The British Typhoon IB and Tempest V, produced by the Hawker Aero Co. Ltd., are powered by Napier Sabre II and IIA engines. They are both heavier and faster than the Spits and have a longer range. Both aeroplanes have armour, bullet-resistant glass and self-sealing tanks. The Typhoon IB was effectively employed as a rocket-carrying aeroplane, and the Tempest V was used for patrol work and ground strafing.

The British Meteor is a two-engine jet fighter that saw limited combat service in World War II. It was produced by the Gloster Aircraft Co. Ltd., and is powered by two Rolls-Royce Derwent Series V turbo-jet units, from which a sea level static thrust of 4,000 lb. is produced. The Meteor has a maximum speed of 608 m.p.h. at sea level. No performance or descriptive data were available on the British Vampire.

As early as 1938 the jet-type engine was approved for production by the German air ministry. The German air ministry ordered full production on June 5, 1943. Yet only 527 ME-262s were accepted by the end of 1944, and this figure was not increased to above 1,400 up until the end of the war. The extremely high performance at all altitudes of the ME-262 was such that if the Germans had got into volume production

sooner, and if they had had the trained pilots and ingenuity to exploit the potentialities of the aeroplane properly, the ME-262 might well have averted the German defeat by another 6 or 12 months.

Another German unconventional aeroplane that saw combat was the ME-163. This was an amazing aircraft. It was the only rocket-propelled fighter in World War II. Of course, it was extremely vulnerable, because of its highly explosive fuels and short range. Its range was measured in terms of minutes, 8-12 min. with full power and up to 60 min. with power on and off. With proper development, however, the ME-163 could also have been a serious threat to the strategic air forces in Europe.

A final jet-type aeroplane that the Germans used in World War II was the AR-234. This was a two-engine heavy-type aeroplane (20,900 lb., in contrast to 10,000 lb. for the ME-262, 11,500 lb. for the ME-163, or 8,600 lb. for the conventional FW-190). It was used mainly for reconnaissance. The Germans did not have many of them, and those they had were no serious threat, but their extremely high speed and performance at high altitudes was such that they became almost legendary, especially in the Mediterranean theatre of operations.

The new types that the Germans were developing at the close of the war, but which failed to see any combat service, were the Viper, the X-4 and the Rheintochter III. The Viper was a piloted, rocket-propelled missile. It had a speed of 620 m.p.h. The Viper was designed to attack aircraft with cannon, rockets or by ramming. In the latter case, there was a special device whereby the pilot could automatically eject himself.

The X-4 was a pilotless missile designed to be launched from mother aeroplanes, somewhat in the manner of the Japanese Baka. However, there the resemblance ceased. Unlike the Baka, which is first of all a glider, and only secondarily a powered aircraft, and which was designed for the attack of surface objectives, particularly ships, the X-4 is a wire-controlled, rocket-propelled gyro-stabilized missile, primarily designed for use against bombers. Proximity fuses would increase the effectiveness of the X-4 by 100%. The Rheintochter III was a new type of radio-controlled flak rocket. It was designed for use against bombers, and for launching from the ground.

**Military Cargo and Transport Aircraft—Army.**—In the cargo-transport field, the Douglas C-47 Skytrain and the Douglas C-54 Skymaster continued to be the outstanding aeroplanes in 1945. The Skytrain is the military adaptation of the DC-3

XB-42 "MIXMASTER," a twin-engined U.S. bomber with dual, counter-rotating propellers in the tail, made a record cross-country flight on Dec. 8, 1945, averaging 432 m.p.h. On Dec. 16 the plane crashed at Oxon Hill, Md., the crew parachuting to safety

airliner, and the C-54 is the military adaptation of the DC-4 airliner. The Skytrain is in the 30,000-lb. class, develops a speed of 200 m.p.h., has a ceiling of 24,000 ft., and an operational range of 1,800 mi. The C-54 is in the 70,000-lb. class, has a speed in excess of 275 m.p.h., operates at 20,000 ft., and has a range of about 3,000 mi. The principal use of the C-47 was in combat hauling troops and cargo, and the C-54 was generally used for the same purpose between the zone of the interior and the theatres of operations.

Other U.S. transport and cargo planes in 1945 included the Curtiss C-46 Commando, a two-engine aeroplane in the 50,000-lb. class, with a speed in excess of 260 m.p.h., ceiling more than 25,000 ft. and range about 2,000 mi.; the big four-engine Lockheed C-69B Constellation, weighing 90,000 lb., with a speed of more than 325 m.p.h. and a range of more than 3,000 mi.; the Douglas C-74 (DC-7) Globemaster, weighing 145,000 lb., with much longer range than the C-69; the two-engine Fairchild C-82 Packet, capable of carrying 42 fully equipped soldiers or 15,000 lb. as far as 3,500 mi.; the Consolidated C-87, another four-engine aeroplane in the 50,000-lb. class, capable of carrying 20 passengers or 6,000 lb. for long runs; the long-range Boeing C-97, with construction similar to the B-29, in the 120,000-lb. class, capable of carrying up to 120 troops and a speed of more than 350 m.p.h.; and finally, the XC-99, a six-engine transport, weighing 265,000 lb., with a speed of 335 m.p.h. at 30,000 ft., and capable of being used as a troop carrier, cargo plane or hospital ship.

The outstanding non-U.S. cargo and transport aeroplane developments in 1945 were the British Tudor I and the French SE-1000. The Tudor I was produced by the A. V. Roe and Co. Ltd., is powered by four Rolls-Royce Merlin 100s, producing 1,850 h.p. at 6,250 ft. Its maximum speed is 346 m.p.h. at 20,000 ft., and its range is 4,890 mi. The SE-1000 is powered by four 1,290 h.p. Gnome-et-Rhone 14-R engines, has a maximum speed of 350 m.p.h. at 10,200 ft. Its range is 3,730 mi., and it has a 12 passenger seating capacity. The SE-1000 can also be used as a passenger liner.

**Fighters—Navy.**—Among naval aircraft, several types were outstanding and responsible for the brilliant record achieved by the carrier and land-based aircraft during the decisive phases of the Japanese war. The gull-winged Corsair (F4U) and the Grumman Hellcat (F6F) proved to be the leading navy fighter craft. The Corsair was used by the marine air force, both from land bases and carriers, as well as in night operations to run up a remarkable string of successes. The Hellcat was the backbone of the navy's carrier fighting forces. It also proved especially capable as a photographic plane.

Three other types of fighter aircraft were produced by the navy during the closing phases of the war. These were the Tiger Cat (F7F), the Bearcat (F8F) and the Fireball (FR). The Tiger Cat is a twin-engine aircraft designed to achieve a top speed exceeding 430 m.p.h. Photographic and night models were developed for use by the marine air force. The Tiger Cat was armed with four 20-mm. cannon and four .50-cal. machine guns. The Bearcat was designed to achieve the maximum performance for a fighter aircraft employing a conventional reciprocating engine as its power plant. It weighed 9,000 lb. and had a 2,000 h.p. Pratt and Whitney engine. Its rate of climb was rated as the best in the naval service. When the war ended the F8F was replacing the F6F on the Grumman production line. Its speed probably exceeded 440 m.p.h. It was armed with four .50-cal. machine guns.

The Fireball is a combination jet and conventional aeroplane with gross weight exceeding 8,000 lb. It was designed to operate from small carriers. The conventional reciprocating engine, plus the purely jet engine as a booster unit, gives the Fireball a speed of approximately 400 m.p.h. This is within limitations of stalling speed and size required for the small carriers. A larger aircraft, known as the XF15C, was contemplated along similar lines for operation from the large carriers. Its contemplated speed is 485 m.p.h. The navy also developed some purely jet-propelled aircraft. These included the XF6U, the XFJ and the XF2D, all with speeds considerably in excess of 500 m.p.h. None of these aircraft was ready for operational use at the end of the war.

The war saw many changes in fighter aircraft. These changes included

the following: Expansion of fighter radius of action by fitting with dropable fuel tanks in 1942; greater use of fighter aircraft as dive and torpedo bombers, especially after the fall of 1944; the introduction and highly successful use of air-borne rocket projectiles for tactical support; and the installation of suitable air-borne radar equipment to make conventional Corsair and Hellcat types into night fighters. At the close of the war, catapults were used to launch all types of naval aircraft from carriers.

The British fleet air arm used the Corsair and Hellcat and also the Seafire III. This last named plane was carrier-based and had a maximum range of 775 mi. It is powered with a Rolls-Royce engine and has two 20-mm. cannon and four .30-cal. machine guns.

**Bombers—Navy.**—The Helldiver (SB2C) was the navy's outstanding dive bomber. It was constantly improved and at the close of the war, the fifth series was being used operationally. Carrying a crew of two, it could carry a maximum bomb load of two 1,000 lb. armour-piercing bombs and had a maximum scouting radius of 500 nautical miles. Its armament consisted of two 20-mm. fixed forward-firing machine guns and two .30-cal. free guns fired by the rear seat man. Its gross weight was in excess of 14,000 lb. It proved to be the navy's only successful dive bomber in the last two years of the war.

One of the navy's most popular and most successful types of aircraft was the torpedo bomber. Here the Grumman Avenger (TBF, TBM) was in actual combat service for a period of three years and three months. The Sea Wolf (TBV) was produced in 1944. It had slightly improved power and armament characteristics over the Avenger. It did not get into action soon enough to offset the highly commendable record of the Avenger.

The British also used the Vultee Vengeance dive bomber. This aircraft had a maximum range of 1,200 mi. and carried five .50-cal. machine guns. The Japanese Judy 33 was the outstanding Nippon dive bomber. It replaced earlier Judy models, as well as the Val. The Judy 33 had three 7.7-mm. machine guns and could carry a maximum bomb load of 1,100 lb. Outstanding torpedo bomber types included the British Barracuda, and the Jill 12, a Japanese model. The Barracuda was manufactured by the Fairey Co., had a range of 638 mi., and was equipped to carry one torpedo. The Jill had a range of 2,000 mi. and could carry either a torpedo or two 550-lb. bombs. The Japanese also were manufacturing a torpedo bomber known as Grace. Its range was slightly more than that of Jill and its weapon-carrying capacity was approximately the same.

**Patrol Aircraft—Navy.**—Patrol aircraft of the navy also achieved distinction as a result of their varied efforts during the war. Land-based Privateers (PB4Y2), Liberators (PB4Y1) and Venturas (PV) ran up remarkable records in attacks on Japanese shipping, extended sea searches and other specialized duties. Seaplanes included the Coronado (PB2Y), the Mariner (PBM) and "the old granddaddy of them all," the Catalina (PBV). These planes were used for transport, air-sea rescue, flying ambulances and many other assignments as well as for actual combat patrols. All naval patrol aircraft carried extensive radar equipment. These enabled extensive attacks to be made at night or in overcast conditions.

The newest type navy patrol plane in 1945 was the Lockheed Neptune bomber. The Neptune is capable of flying 300 m.p.h., with a normal range of 3,500 mi. It carries a ton of the latest type radar-radio equipment, two torpedo rockets and six 20-mm. cannon. The Neptune has a "varicam tail," which allows the pilot to vary the curve of the horizontal tail surface and thus balance a heavy load in one part of the plane and keep it in level flight. The Neptune can carry four 2,000-lb. bombs or a greater number of lighter weight bombs. It can also carry twelve 325-lb. depth charges for submarine attack. Extra tanks stretch the range of the Neptune to 5,000 mi. It carries a crew of seven.

Three foreign patrol seaplanes that played an important role in the war were the British Sunderland, the Japanese Mavis and Emily 12. The Sunderland was a well-armed four-motored bomber with a maximum range of 2,480 mi. The Mavis and Emily 12, also four-engined, had maximum ranges of approximately 4,000 mi. They were not so well armed as the Sunderland but performed very excellently as the "scouting eyes" of the Japanese navy. They were both capable of carrying either two torpedoes or a bomb load of approximately 3,500 lb.

**Observation Aircraft—Navy.**—Another category of naval aircraft which played a formidable role during the war was the observation-scout float type, operating from battleship and cruiser catapults. The Curtiss SOC was a biplane attached to cruiser scouting duties. In addition to observing and spotting the gunfire of cruiser groups, these biplanes performed admirably in antisubmarine search. However, they suffered from lack of speed and thus were very vulnerable.

The navy answered the need for a faster and more effectual type of scouting float plane by developing the Sea Hawk (SC1). It is a single place aircraft although provision is made for carrying a wounded passenger in a special fuselage compartment. It carries two forward-firing .50-cal. machine guns and has an engine with a take-off rating three times that of the Kingfisher. Its scouting radius is 270 nautical miles. This plane proved superior to the Kingfisher and SOC which it replaced.

Among foreign type float aircraft, the British had a biplane known as the Sea Otter I, while the Japanese had four prominent types: Jake II, Paul II, Norm II and Rex II. The range of the Sea Otter I was 920 mi. All the Japanese float planes were excellent, with the Norm and Rex particularly outstanding. These two planes possessed engines with a take-off rating of 1,825 h.p., and the Norm had the unique feature of being able to jettison its floats.

**Avocadoes:** see FRUIT.

**Azores, The:** see PORTUGAL.

**Bacon.** The reduced slaughter of hogs in the United States in 1945 compared with 1944 was reflected in the production of bacon. Total production of bacon was estimated to be about 500,000,000 lb. compared with a total of more than 600,000,000 lb. in 1944. The amount of bacon produced depends upon the trimming practices and type of hog in the market. With the end of World War II the United States demand was for more lean, sliced bacon. In 1944 a total of 549,800,000 lb. of sliced bacon was produced under federal inspection. During 1945 the rate of production was reduced and in the first ten months of 1945 only 310,000,000 lb. was produced compared with 479,000,000 lb. in the same period of 1944. Bacon was scarce in retail markets throughout 1945 though government purchases declined after Aug. 19. (See also Hogs; MEAT.) (J. C. Ms.)

**Bacteriology.** Numerous publications suggested the probable usefulness of streptomycin as a therapeutic agent in tuberculosis, typhoid, tularaemia and other infections, especially by gram-negative bacteria not susceptible to penicillin. The search for new and better antibiotics or those useful where penicillin or streptomycin are not, continued, yielding *Bacitracin* produced by *Bacillus subtilis* and apparently a very useful antibiotic drug; *Lycopericin*, a product of the tomato plant preventing growth of a fungus (*Fusarium oxysporum*) causing a wilt of tomatoes; an unnamed product of *Aspergillus ustus* inhibitory to tubercle bacilli; *violacein*, an antibiotic pigment produced by *Chromobacterium violaceum*; and others. A search for virus-inactivating antibiotics among a wide variety of animal, plant and bacterial materials revealed their rarity. An interesting possibility was revealed by Chinese scientists at Kunming in an antibiotic extracted from water chestnuts and called by them, *puchiin*. An extremely important advance in this field also was a report of the meeting of the permanent commission on biological standardization of the health organization of the League of Nations, at London, resulting in the formulation and adoption of an international standard unit and a working unit of penicillin, and the provision of means of producing, testing and storing standardized material. In 1945, also, the chemical structure of penicillin was published, an advance of outstanding importance to all interested in bacteriology.

In the field of sanitary bacteriology there appeared, among many interesting papers, a new and quicker presumptive test for sewage pollution of water depending on nitrate reduction in a selective medium, and further reports on bacteriological improvements in water supplies due to the use of break-point chlorination.

An extensive series of reports of a group of workers associated with the army epidemiological board, established on a firm foundation the usefulness of a new vaccine in preventing most epidemic influenza. Work was continued on the development of purified, potent, compact and stable antigenic extracts of organisms related to the typhoid bacillus which promise, among other things, to eliminate many sore arms and severe reactions due to antityphoid shots.

The monumental work of the United States of America Typhus commission in demonstrating the aetiology, and animal and insect vectors of an important and dangerous scourge of the military forces in Pacific islands (mite or scrub typhus or tsutsugamushi disease) was also published in 1945.

New and important reports concerning the continued war on air-borne disease also appeared, including work showing the value of oiling of floors and bedding in helping to control the spread of scarlet fever streptococci and similar organisms by diminishing aerial dust, especially when used with disinfectant

vapours. In the fields of industrial and agricultural bacteriology many papers appeared, among them being reports on improvements in the bacteriological method of assaying vitamins, the activity of bacterial and mould amylases as conversion agents in alcoholic fermentation, studies of methods for preparing active enzymes from bacteria, fermentation processes for making itaconic acid and glycerin, and the role of bacteria in petroleum destruction and formation. **Badminton.** Continuation of World War II once again restricted badminton competition to sectional tournaments in 1945, and the national championship was cancelled for the third straight year. On the west coast, strong fields were attracted to northern and southern California and Pacific southwest tournaments. Eastern, midwest and Texas championships drew the strongest players in their sectors, while the first annual Kodak Invitational boasted a top-flight group of Canadians who dominated the field.

Bernard McCay of Pasadena, Calif., dominated men's competition on the Pacific coast, winning the northern California and Pacific southwest singles championships and finishing second in the southern California meet. Janet Wright carried on much the same domination in the women's singles, capturing the northern and southern California titles and bowing only to Helen Noble of Pasadena in the Pacific southwest singles.

Players from St. Louis, Mo., dominated the midwest championships, capturing four of the six major titles. Richard Casey of St. Louis won his third singles championship. Marie Bytnor, also of St. Louis, won the women's crown by defeating the defending champion, Eleanor Coombs of Chicago, Ill., 3-11, 11-6, 11-1, in the final. The Texas tournament was dominated by George Harman of Tulsa, Okla., in the men's division and by Sgt. Bertha Barkhuff, Camp Hood, Tex., with a grand slam in the women's events.

Eastern competition was concentrated on doubles, with the most interest centred in the Kodak tournament. Toronto entries captured both the men's and women's doubles, with Evelyn Effnert and Joan Hennessey winning the women's crown and Jack Muir and Grant Henry taking the men's division. The French national championship was won by Lieut. "Ozzie" H. Hilton of the U.S. navy. (M. P. W.)

**Bahamas.** An archipelago of about 3,000 islands, islets (or cays) and rocks, east of Florida and north of Cuba, extending about 800 mi. in length, and organized politically as a British colony. The capital and only city is Nassau (pop. 19,756). Area: 4,403.5 sq.mi.; pop. (1943 census): 70,619, of whom 57,346 are Negroes. New Providence island had a 1943 population of 33,350 (density, 506.7 per sq.mi.), and the remaining islands (only about 20 of which are inhabited) 37,269 (density, 15.6 per sq.mi.). The constitution of the crown colony

(granted in 1728) provides for a legislative council of nine crown-appointed members, a house of assembly of 29 members elected by 15 districts, and a crown-appointed governor aided by an executive council of not more than nine. H.R.H. the duke of Windsor served as governor in 1945 until his resignation March 15; he was succeeded by William L. Murphy who was inducted July 28.

**History.**—The Petroleum act was the most important legislation adopted in 1945. The duke of Windsor's resignation was followed by his presentation of a development program to the chamber of commerce on March 29 and his farewell address to the assembly on April 4. The assembly on July 3 rejected a proposal for participation in a British Caribbean colonial federation but asked for a greater degree of responsible government. Air Marshal Duncan Colyer announced Aug. 24 that a unit of the R.A.F. would remain in the Bahamas. Various wartime controls were lifted on Sept. 4. Speculation existed in the latter part of 1945 about the possibility of commercial use of wartime aviation installations.

**Education.**—Primary education is compulsory. School enrolment in 1942 in schools of all classes was 25,077.

**Finances.**—The monetary unit is the pound sterling, linked to the pound in London, and pegged in 1945 at \$4.06 for buying and \$4.00 for selling. A continuous inflow of funds existed in 1945 because of the recruitment of about 6,000 labourers for work on United States farms. Inflation continued, however, and hence little improvement in living conditions resulted. Merchants were the chief beneficiaries of the changed economic situation. The cost of living in 1945 was 125% above that for 1939. Life insurance reports in Jan. 1945 indicated some 10,600 policies in force for a total of about \$4,434,420.

**Agriculture and Industry.**—Agriculture, with the exception of tomato and sisal growing, is not important, principally because of inadequate soils, and practically all foodstuffs are imported. A well developed dairy and chicken industry on Eleuthera island provides Nassau with partial supplies of milk, chickens, eggs and butter. Of 120,000 mulberry cuttings imported from Venezuela in 1944, only 40,000 survived; it was hoped that they might provide the basis for silk production. A large tomato crop was expected in 1945, the acreage having been increased from 1,500 to 2,000. Straw and shellwork is the principal industry of the natives. Sponge fisheries, previously closed by government order after a disastrous experience with disease in 1938-39, showed signs of recovering in 1945. Lumbering and fish canning on Grand Bahama and salt evaporation on Inagua island are other forms of production. Various oil companies sent representatives early in 1945 to investigate prospects, but no drilling was undertaken in the first eight months.

**Trade and Communications.**—Total imports in 1944 were valued at £1,735,899 (1943, £1,526,624); exports in 1944 were valued at £337,047 (1943, £372,315). An unfavourable trade balance is customary for the colony. Chief items of imports are foodstuffs and manufactured articles. The principal sources of imports in 1944 were the United States 56% (1943, 61%); Canada 27% (1943, 20%); the United Kingdom 5% (1943, 5%); Jamaica 4%. The leading exports include straw and shellwork, valued in 1944 at £72,615 (1943, £177,161), tomatoes and pineapples and short-fibre sisal. The United States received 71% of total exports in 1944, Canada 22% and the United Kingdom 6%. Export of shells in the first half of 1945 was valued at \$50,051; straw work at \$121,831; agricultural products (principally tomatoes) between Nov. 17, 1944, and March 28, 1945, at \$342,414.

The colony has no railroads and only an inadequate highway system. New Providence island has 18 mi. of unimproved earth, 18 mi. of water-bound macadam, and 100 mi. of surfaced highways. Vehicle registration Jan. 1, 1945, included 930 automo-

biles, 233 trucks and busses, and 40 motorcycles. Pan American Airways operated passenger planes between Miami and Nassau six days a week. New Providence has an automatic telephone system with 1,300 subscribers. (See also WEST INDIES, BRITISH.)

**Baker, Sara Josephine** (1873-1945), U.S. child hygiene expert, was born Nov. 15 in Poughkeepsie, N.Y. She received her M.D. degree from the Women's Medical college, New York infirmary, 1898, and then practised medicine in New York city. She became assistant to the commissioner of health in that city, 1907. Dr. Baker organized the first bureau of child hygiene under government control in New York, becoming director in 1908. She had some difficulties with her staff when she was appointed to this position because several of the male doctors rebelled at working under a woman. Her efficiency and competence, however, were indisputable and she subsequently won full co-operation from her assistants. She persuaded the municipal authorities to establish health stations throughout the city, and at the time of her retirement these stations cared for some 60,000 babies a year—one-half the number born in New York annually. Under her administration child mortality in New York city was the lowest of any large city in the U.S. or Europe. Dr. Baker was president of the American Child Hygiene association, 1918-19, was consultant in child hygiene in the U.S. public health service and held responsible positions in various other important health organizations. She authored *Healthy Mothers, Healthy Babies* and *Healthy Children* (1923), *Child Hygiene* (1925) and *Fighting for Life* (1939). She died in New York city, Feb. 22.

**Baltic States:** see ESTONIA; LATVIA; LITHUANIA.

**Baltimore.** The only large city in Maryland, and seventh largest in the United States. The population according to the federal census of 1940 was 859,100; white, 692,705; non-white, 166,395 (19.4%), mainly Negro. The estimated civilian population as of July 1945 was 930,000. Land area, 78.58 sq.mi.; water area, 13.35 sq.mi. The mayor in 1945, whose four-year term of office began in 1943, was Theodore R. McKeldin, Republican. Budget appropriations for 1945 totalled \$62,647,692. Actual expenditures during 1944 amounted to \$60,479,514. The city tax rate for 1945 was \$2.89 per \$100 of assessed valuation (state rate, additional, \$.12). The gross funded debt as of Nov. 30, 1945, was \$157,663,000; the net debt was \$118,579,929 (not including accrued interest amounting to about \$200,000).

There were 79,552 white students and 34,269 Negro students, ranging from pre-kindergarten through teachers college, enrolled during the school year 1944-45; total, 113,821. The actual enrolment on Sept. 30, 1945, was 72,333 white students and 32,517 Negro students; total, 104,850. Dr. David E. Weglein was superintendent of public instruction in 1945. The department of education is administered as a unit apart from the school system of the rest of the state.

The end of World War II brought a lessening of shipbuilding and ship-repair work. By the end of 1945, reconversion was practically completed in most industries, the largest single reconversion project being that of the Chevrolet-Baltimore division of the General Motors corporation. Production continued vigorously in these lines, among others: metals and metal goods,

distilled liquors, plastics and electrical goods (including radios). Plant investment during 1945 surpassed that for the three preceding years. Building permits for the city were at \$14,800,000, being 138% above 1944. While many workers received unemployment compensation, few who desired available work were unable to obtain it. Total entrances and clearances of foreign trade shipping were 2,931 vessels of 11,000,000 net registered tons, an increase of 40% above 1944. On June 30, 1945, the resources of Baltimore banks aggregated \$1,659,702,000, representing slightly more than 75% of the bank resources of all Maryland.

### Bank for International Settlements.

Under a lessened tension due to the termination of the war in Europe, the 15th annual meeting of the Bank for International Settlements was held on June 11, 1945, at Basle, Switzerland. Following customary procedure of the war years, Dr. Ernst Weber, Swiss chairman of the board of directors, presided over the meeting, with member nations represented by proxy in lieu of personal representation.

The balance sheet and profit and loss account, covering the fiscal year ended March 31, 1945, were approved. With the future status of the bank in doubt and the need for strengthening of the bank's reserves, no action was taken with respect to declaration of a dividend.

The annual report of President Thomas H. McKittrick dealt with economic and social problems confronting the world, particularly the former industrial nations of Europe. Attention was called to the growing tendency toward socialistic measures embraced by governments and the report indulged in mild speculation as to possible connection between these paternalistic developments and the widespread increase in the birth rate between 1938 and 1944, in sharp contrast to the trend in most countries during World War I. The report cautioned that social measures constitute a charge on the production of wealth, that in most countries about three-fourths of all business is in private hands, and that material progress, as well as attainment of maximum employment, depends primarily upon results achieved by private initiative and enterprise. "Without economic expansion," the report emphasized, "there can be no real social security."

An important lesson of the war to which attention was called was that speedy transformation in wartime may be obtained with the aid of government intervention, and that this might be applied also to reconversion of industry during the transition period.

The latest available statement of account of the bank, as of Oct. 31, 1945, showed a balance sheet total of 454,331,117 Swiss gold francs, compared with 466,064,273 in Oct. 1944. Gold in bars and coin and other cash amounted to 161,209,385 Swiss gold francs, constituting 35½% of total assets. Long term deposits were 229,001,250 Swiss gold francs, more than 50% of liabilities. Short term and sight deposits, in gold and various currencies, totalled 23,654,729 Swiss gold francs. The bank was capitalized at 500,000,000 Swiss gold francs, of which 25% was paid up.

(C. A. SR.)

**Banking.** In the United States the total amount of deposits adjusted and currency outside banks, which had been \$78,200,000,000 in Dec. 1941, increased by \$12,800,000,000 during the first ten months of 1945, and stood at \$163,800,000,-

THE BANK OF GUAM, operated by the U.S. navy department in a Quonset hut, was reopened in 1945. Savings and checking accounts were used by military personnel and by civilians

000 on Oct. 31, 1945. On that date demand deposits adjusted amounted to \$78,100,000,000, and U.S. government deposits \$11,700,000,000. Currency outside banks stood at \$26,400,000,000 and time deposits at commercial banks, mutual savings banks and the postal savings system at \$47,600,000,000.

The Federal Reserve survey of demand deposit ownership showed that of the \$32,000,000,000 increase in demand deposits of individuals and businesses between Dec. 1941 and July 1945, one-fourth represented increases in demand deposits of manufacturing and mining businesses, about one-fifth increased holdings of trade concerns and about two-fifths growth in personal deposits. During the period after Dec. 1941 manufacturing and mining businesses increased their holdings by 84% and trade firms by 137%. Personal holdings rose 140%. The substantial wartime increases in currency and in time deposits were largely held by individuals.

Commercial bank holdings of government securities rose to new heights during 1945, although the increase was less than in each of the two preceding years. On June 30, 1945, government securities owned by commercial banks amounted to \$84,000,000,000; these comprised nearly three-fourths of their total loans and investments. Commercial banks held about one-third of the total interest-bearing U.S. government debt.

The growth in bank holdings of government securities took the form chiefly of treasury bonds purchased in the market. Although total holdings of government obligations by weekly-reporting member banks in 101 leading cities rose \$4,700,000,000 during 1945, their holdings of treasury bonds increased by \$5,200,000,000. Certificate holdings rose \$1,100,000,000 while weekly-reporting member banks held \$1,500,000,000 less of treasury bills, treasury notes and guaranteed obligations.

Bidding for treasury bonds in the market by commercial banks resulted in major changes in the pattern of yields on government securities which had been in existence after the formulation of war financing plans in 1942. Heavy bank buying of treasury bonds provided a strong demand for such securities, not only directly, but indirectly through corresponding expansion in the money supply held by the public. Although the treasury bill rate remained at three-eighths of 1%, the established rate at which the federal reserve banks stood ready to buy all bills offered, only one-fourth of the treasury bills outstanding were held outside the federal reserve banks. The yield curve for bank-eligible, fully taxable treasury bonds flattened out during 1945, as the prices of these bonds rose to premiums. The 1½% treasury bonds of Dec. 1930, offered in the Seventh

War Loan drive, yielded 1.17% on Dec. 31, 1945; the 2% treasury bonds of Dec. 1952-54, which sold at a yield to date of first call of 1.96% at the beginning of 1945, yielded 1.33% to call at the end of the year.

The distinction between treasury bonds currently eligible for purchase by commercial banks and those not so eligible (except for limited purchases during war loan drives for the investment of savings deposits) became of increasing significance. The bank-ineligible treasury bonds of Dec. 1967-72 yielded 2.41% to call date on Dec. 31, 1945. In contrast, the bank-eligible treasury bonds of Sept. 1967-72 sold at a yield of 1.99%; these bonds yielded 2.46% at the beginning of the year.

Yields on high-grade municipal bonds declined from 1.87% to 1.64% during 1945; yields on Aaa corporate bonds declined from 2.70% to 2.61%. Not only did long term interest rates decline to lower levels than ever before, but also the spread between yields on investments involving varying degrees of risk narrowed, as a result of the strong pressure in the markets of funds seeking investment.

The movement of commercial and industrial loans during 1945 reflected an increase in loans for nonwar purposes which more than offset a decline in loans outstanding for war purposes. Loans for purchasing and carrying securities, especially government securities, increased during the year, fluctuating with war loan drives. Banks made plans for active lending operations as an aid to the attainment of high levels of production and employment in peacetime. Emphasis in the field of business loans was placed on newer types of loan procedures, such as term loans, loans on accounts receivable and warehouse receipts and bank credit pools. Expansion in consumer credit and home modernization loans was anticipated.

Net profits of commercial banks continued their wartime increase, due primarily to earnings on increased holdings of government securities. About half of the gross earnings of commercial banks in the aggregate were derived from interest received on government securities. For all member banks of the Federal Reserve system, net profits on total capital accounts amounted to 11.0% in the first half of 1945, as compared with 9.7% in 1944 and 6.7% in 1941. The average rate earned on loans by member banks declined to 3.0% in the first half of 1945, continuing a downward movement that had been underway for several years. The average rate earned on securities remained unchanged at 1.5%. Cash dividends increased in 1945, but not substantially. Banks continued to add a large portion of their net profits to capital accounts. Not a single bank was suspended during 1945. (See also BUSINESS REVIEW; CONSUMER CREDIT; LAW; PRICE ADMINISTRATION, OFFICE OF.)

**Investment Banking.**—The year was an active one for corporate financing. New corporate securities issued for new capital and for refunding reached a total of \$5,600,000,000 in the 11 months ending Nov. 30, 1945, an amount greater than in any year after 1929. Corporate issues for new capital amounted to \$1,100,000,000, somewhat under the levels of 1936 and 1937. Corporate issues for refunding totalled \$4,500,000,000, exceeding the total for any previous whole year for which data are available. Refunding operations were stimulated by the low level of interest rates and by the tax saving that corporations in the excess profits tax brackets were able to secure by refunding outstanding bond issues. State and municipal issues were offered in light volume. (See also WAR BONDS.) (J. K. L.)

**Mutual Savings Banks.**—In New York state in 1945, an amendment to the banking laws authorized savings banks to enter the housing field as owners and operators. Savings banks could own the stock and obligations of a corporation organized under the laws of New York state for the purpose of providing housing, subject to such conditions as may be prescribed by the

banking board. Under banking board regulations, rent in the housing projects owned by savings banks was limited to \$25 per room per month and if erected in conformance with Urban Redevelopment laws the projects could enjoy partial exemption from real estate taxes as provided in those laws.

A group of banks already entered into tentative agreements with the city of New York to proceed conditionally with the erection of three projects which, when built, would house between 3,500 and 4,000 families and cost between \$20,000,000 and \$25,000,000. These projects were developed by the banks through the instrumentality of the Savings Banks Trust company, an organization wholly owned by the savings banks of the state, which acts as a co-ordinating agency making all the preliminary studies as to location, size, design and costs.

An important development of interbank co-operation occurred in the forming of the Savings Bank Investment Fund in Massachusetts, a vehicle through which the savings banks would have an opportunity to invest in securities not eligible for purchase by individual banks. Banks could invest up to 10% of their deposits in the proposed fund which was managed by a board of directors elected by the directors of the Mutual Savings Central Fund, Inc. (a central pool for assistance to savings banks if need arises).

Effort was being made in 1945, to replenish mortgage portfolios particularly by financing low cost homes. Savings bank laws in most states limited such loans to amounts not exceeding 70% of the appraised value of the mortgaged property. In 1943 New York state raised its limit to 80% of the appraised value on loans on homes located within 50 mi. of the bank making the loan. In 1945 other states enacted similar laws setting new percentage limitations as follows: Connecticut 80%, Massachusetts 75%, New Jersey 80%, Vermont 80% and Washington 80% of appraised value.

In 1927, Massachusetts authorized savings banks to make personal loans in limited form. In 1945 that state extended the limit to \$1,000 for loans without security other than personal note to mortgagors for the purpose of repairing or remodeling mortgaged property. It also authorized loans on the note of one or more makers with or without security in amounts up to \$1,000.

During 1945 the financial condition of several railroads improved to the extent that their bonds became attractive once more and moderate new investment took place. State banking laws pertaining to rail securities had been greatly detailed in respect of qualifications for savings bank investment. In Connecticut in 1945 a new law was enacted which permitted a savings bank to invest not exceeding 20% of its assets in bonds of Class I railroads, provided such bonds are named in the list of bonds certified to the bank commissioner by a committee known as the "Savings Banks' Railroad Investment committee." This committee consists of six members appointed by the governor, none of whom may be engaged in the business of dealing in securities. Nominations to this committee were submitted to the governor by the bank commissioner and commercial and savings banks associations. In Minnesota the banking law was rewritten in order to qualify a great many high-grade new issues which had previously been nonlegal for savings banks in that state, where the subdivision defining eligibility of railroad mortgage bonds was completely rewritten in order to provide standards for "qualifying railroad corporations" and the "eligible obligations" of such corporations. The railroad companies have to meet certain tests as to size, payment record, debt ratio and net earnings coverage above fixed charges.

In the year ended July 1, 1945, all mutual savings bank deposits increased \$1,950,327,636 or 15.7% to a total of \$14,378,413,200; surplus increased \$2,094,379,836 or 15.1% to a total

of \$15,953,333,612; accounts increased 622,998 or 3.9% to a total of 16,725,733. The ratio of surplus to deposits on July 1, 1945, was 10.7% as compared with 11.1% on July 1, 1944. Dividends paid on deposits averaged 1.70% as compared with 1.78% the previous year. During the year two banks were absorbed by mergers so that the number of banks on July 1, 1945, was 532.

Gains in deposits were completely absorbed by the purchase of U.S. government bonds in the Sixth and Seventh War Loan drives and the Victory Loan campaign in which the banks subscribed to \$2,314,000,000, \$2,241,000,000 and \$1,770,000,000 respectively. (See also WAR BONDS.)

Savings bank life insurance continued to expand in the three states in which it is authorized. In Massachusetts, on Nov. 30, 1945, the last date for which information was available at the close of the year, there were 32 issuing banks and 116 agency banks, with insurance in force of \$266,754,699, representing 294,184 policies. In New York, on Nov. 30, 1945, there were 31 issuing banks and 19 agency banks with insurance in force of \$59,210,131 representing 55,743 policies. In Connecticut, on Nov. 30, 1945, there were eight issuing banks and 15 agency banks with insurance in force of \$5,800,303 representing 6,215 policies. (HE. BR.)

**Canada.**—Total deposits of the ten chartered banks rose \$436,000,000 in the first ten months of 1945, with a steady growth in time deposits accounting for the increase. On Oct. 31, 1945, total deposits of chartered banks stood at \$5,600,000,000. Total securities held amounted to \$4,200,000,000, an increase of more than \$500,000,000 from the beginning of the year. Loans and discounts other than security loans declined slightly.

Security holdings of the Bank of Canada rose \$317,000,000 through Oct. 31, 1945, to a level of \$1,800,000,000. Note circulation increased \$100,000,000, with chartered bank notes showing some decline. (J. K. L.)

**Great Britain.**—Trustee savings banks in the United Kingdom, the counterpart of the mutual savings banks in the U.S., reported another record increase for the year ended Nov. 20, 1944, of £78,624,940 in deposits and £4,676,851 in government stock held for depositors on the savings banks' registers. The cash balance due to depositors in the Ordinary department was £410,984,411, in the Special Investment department £115,818,940 and government stock held for depositors had a nominal value of £64,758,954. The combined surplus fund was £14,595,639. On Nov. 20, 1944, there were 88 trustee savings banks in the United Kingdom with 741 offices. During 1945 there was a net increase in the number of accounts, including holders of investment stocks bought by the banks for account of clients, of more than 268,000 bringing the total accounts to 5,346,661. (See also BANK OF ENGLAND.) (HE. BR.)

**Australia.**—Fundamental legislation was enacted during 1945 in Australia concerning the organization and functions of the Commonwealth Bank (the central bank of Australia), the relationship between the government and the Commonwealth Bank and the control of the operations of the trading banks (commercial banks). The Commonwealth Bank was charged with the duty of acting as a central bank and pursuing a monetary and banking policy which would best contribute to the stability of the currency, the maintenance of full employment and the economic prosperity and welfare of the people of Australia. Management of the Bank was placed in the hands of a governor, appointed by the government.

The treasurer of Australia was to be informed by the bank of its monetary and banking policy. In event differences of opinion arise between the bank and the government as to policy, and if the treasurer and the bank can not reach agreement, the government will accept responsibility for the adoption by the bank of the policy in accordance with the opinion of the government, and the bank will then give effect to that policy. Provision was made in the legislation for abolishment of the reserve

requirements against the note issue. These requirements had been 25% to be kept in the form of gold or English sterling. Authority is granted to the government to mobilize and provide machinery for the control of foreign exchange and gold resources.

The Commonwealth Bank acts not only as the financial agent of the Commonwealth of Australia but also as the banker of the government. Any deficits not met by borrowing from the nonbanking public will be met by borrowing from the central bank. Trading banks may not purchase or subscribe to securities of the Commonwealth, except with the consent of the Commonwealth Bank.

**Europe.**—In December the National Constituent assembly of France passed a bill nationalizing the Bank of France and four large private banks. The prime minister of Belgium advocated nationalization of the Belgian National Bank, and a commission in the Netherlands was considering ways and means of nationalizing the Netherlands Bank.

Action was taken in France, Belgium and the Netherlands to reduce the amount of money in circulation as part of the programs of these countries for economic and financial rehabilitation. Currency conditions in central and southeastern Europe continued to deteriorate, and in some countries the stage of hyperinflation had been reached. (See also BANK FOR INTERNATIONAL SETTLEMENTS.) (J. K. L.)

**Bank of England.** The main event of 1945 was the introduction on Oct. 10 of the bill for the nationalization of the Bank of England. For years the nationalization of the bank had been a cardinal tenet of faith of the British Labour party, and so the general election result made the bill a foregone conclusion. When the Labour government took office, the bill was pushed to the forefront of its nationalization program, partly to satisfy the Labour rank and file, and partly because it was a comparatively simple measure.

The holders of the 14,553,000 capital stock of the bank were to receive in exchange for these holdings 58,212,000 of 3% British government stock, redeemable, at the government's option, at par on or after April 5, 1966. As from 1923, the stockholders had been getting 12% on the bank stock, with no prospect of any change in their dividend, the four-to-one exchange meant that they would receive the same income as before this "previous income" test was deliberately applied by the government in this special case of the bank. It sidetracked such questions as the stockholders' claims to one bank's assets, accumulated reserve, good-will and so on.

The governor, deputy governor and director of the bank would thereafter be appointed by his majesty. The governors would hold office for five years and the director for four years, but all would be eligible for reappointment. The number of directors was to be 16, instead of 24 as previously. This made, with the two governors, a court of 18.

Section 4 of the bill crystallized into legal form the informal but effective relationship which before and during World War II had gradually developed between the government, the Bank of England and British banks. Under this section, the treasury may after consultation with the governor of the bank, issue directions to the bank. The Bank of England in turn may request information from and make recommendations to all bankers, and may, if so authorized by the treasury, issue compulsory directions to any banker to this effect. This section was the most controversial part of the whole bill, for while the existing government's intention, no doubt, was to operate it reasonably, it could be used to give a future government full powers over all banks operating in Great Britain.

During the spring of 1945, the formation of two new financial institutions was announced. The larger of the two obtained its share of capital from the Bank of England, the insurance companies and investment trust companies, and its loan capital from the banks. Its purpose was to finance whole sections of British industry. The smaller institution was financed almost entirely by the joint-stock banks. Its function was to provide British firms with medium-term capital in relatively small amounts. The need for finance of this kind was specified in the Macmillan report in the early 1930s.

The Bank of England played a leading part in the organization of these two new institutions.

The table shows changes in the bank's condition during the first nine months of 1945.

Bank of England					
(£ million)

**Baptist Church.** Two momentous programs were adopted in 1945 by Baptists of the Northern convention in the United States. One, the Christian Life Crusade, had as its purpose the bringing of Northern Baptists face to face with their imperious obligations and privileges in spiritual concerns.

The second, the World Mission Crusade, seeks the means whereby that evangelical service may be implemented. The latter objective is the raising of \$14,000,000 between Oct. 7, 1945, and April 30, 1947. This sum was to be spent for advance in missionary labour at home and abroad; the restoration of church edifices, schools and hospitals; extension work in cities; education; and pension funds for ministers and missionaries.

The Southern Baptists found themselves prohibited by war regulations from celebrating in 1945 the centennial of their convention. A challenging centennial crusade was organized. With the motto, "Crowning a Century for Christ," the convention enthusiastically undertook to contribute \$20,000,000 to missions and benevolences in the centennial year with advance planned in evangelism, enlistment, education, rehabilitation, stewardship and benevolence.

The denomination in the south was encouraged by its marvellous growth during the century. In 1845 the total membership was 352,822. In 1945 it was approximately 5,500,000. A hundred years before, the Baptists in all the United States (811,935) gave \$160,584.82 (20 cents per member) to missions and benevolences. In 1945 the Southern Baptists gave more than \$63,067,083 or about \$11.48 per member.

The National Baptist Convention, Inc., U.S.A. (Negro), adopted a budget of \$200,000 for the year July 1945-June 1946. Rehabilitation and extension, home and foreign, was projected.

Baptists of Canada rejoiced in the consummation of a long-hoped-for organization—The Baptist Federation of Canada, which, formed in Dec. 1944, co-ordinated the three conventions of the dominion—Maritime, Ontario and Quebec and the Union of Western Canada.

They were also uniting in 1945 in an inter-church missionary centenary. The first missionary of any denomination in Canada to go to a foreign field was Richard Burpee, a Baptist, who sailed from Halifax for Burma in 1845. A few months later the Presbyterians sent John Geddie to Aneiteum in the South Seas. In the same year Bishop Mountain of Quebec inaugurated missions of the Church of England in Canada among the Indians of the northwest. Joint observances were to be held by these three communions commemorating this century of missions.

Burdened by the expense of repair of many church edifices British Baptists nevertheless appealed for increased gifts for foreign missions—setting apart as self-denial week, Oct. 28-Nov. 4, 1945. The Scottish Baptists supported more than 50

missionaries with 39 in active service and others awaiting passage.

South African Baptists sought £15,000 (£1=403.5 cents U.S.) for extension work to serve the many English speaking people who are moving into frontier settlements.

The Northern Baptist convention recorded 1,556,112 members; the Southern Baptist convention, 5,500,000; Negro (two conventions) 4,162,332; Canada 139,405; Great Britain 385,933; New Zealand and Australia 40,774; Africa 167,175; world total 13,314,620. (See also CHURCH MEMBERSHIP.)

**Bar Association, American:** see SOCIETIES AND ASSOCIATIONS.

**Barbados:** see WEST INDIES, BRITISH.

**Barbier, George** (1865?-1945), U.S. actor, was born in Philadelphia, Pa. After playing a small role in a school pageant, he decided that he was more inclined toward the theatre than to the ministry and he left the Crozier Theological seminary in Upland, Pa., to start a career as an actor. After the usual arduous apprenticeship in stock companies, he won his first Broadway role in Daniel Frohman's production of *The Hunchback of Notre Dame*. He enjoyed a long and distinguished career on the New York stage before going to Hollywood in 1930. A volatile personality and a skilled character actor, he became an indispensable feature actor for those companies that needed a crusty and querulous businessman with an explosive temper. His portrayals had more than adequate vitality and he became known as a "scene stealer." Mr. Barbier died at his Hollywood home, July 19.

**Barium Minerals.** The production of barite in the United States was as shown in the table.

Production continued to rise in 1945, the total of 521,623 tons in the first three quarters exceeding that for the full year in 1944. Imports kept pace, with 204,981 tons in the same period, although demand was falling, and consumption was 423,328 tons.

U.S. Production of Barite, 1940-44  
(in thousands of short tons)

	1940	1941	1942	1943	1944
Production, crude . . . . .	390.5	483.4	449.9	429.3	515.1
Sales, crude . . . . .	409.4	503.2	429.5	420.3	518.6
Consumption . . . . .	404.3	490.8	449.4	453.7	595.6

Imports . . . . .	7.4	0.5	4.7	—	67.9

Canada increased in barite output from 338 tons in 1940 to 24,474 tons in 1943 and 118,719 tons in 1944, of which 104,000 tons was exported, 66,000 tons crude and 38,000 tons ground.

(G. A. Ro.)

**Barkley, Alben William** (1877- ), U.S. politician and senator, was born Nov. 24 in Graves county, Ky., the son of a tobacco farmer. He received his B.A. degree from Marvin college at Clinton (1897) and studied at Emory college in Oxford, Ga., and the University of Virginia Law school. He was elected to the U.S. house of representatives in 1912 and was re-elected six successive times, serving through 1926. In the latter year, he was elected to the senate and was re-elected in 1932, 1938 and 1944. A staunch administration supporter, Barkley helped push through the Selective Service bill and the Lend-Lease bill, and also sponsored the amendments to the Neutrality act which passed the senate in Nov. 1941. After 11 years of uninterrupted support of the Roosevelt administration, Barkley broke with the presi-

dent over the tax veto bill, assailing (Feb. 23, 1944) the veto message as "a deliberate assault upon the legislative integrity of every member of congress." Thereupon Barkley resigned his leadership of the senate. The president, disavowing any intention of slurring the integrity of congress, urged him to reconsider his resignation. Both houses of congress overrode the president's veto, and on Feb. 24, a Democratic senate caucus unanimously re-elected Barkley to senate leadership. When congress decided to investigate the Pearl Harbor incident, Barkley was named (Sept. 18, 1945) chairman of the committee of inquiry. He subsequently pledged a nonpartisan investigation and said (Nov. 10) that he would "lay all the facts before the public, no matter whom they may hurt in high or low places."

**Barley.** The 1945 barley crop was 277,246,000 bu. as estimated by the United States department of agriculture. This was about 2½% below the 1944 crop of 284,426,000 bu., but 1½% above the average of 1934-43 of 273,481,000 bu. The acreage for harvest was reduced to 10,606,000 ac. in 1945 or 14% below 1944 but the higher yield per acre of 26.1 bu. brought the total up sharply. This acre yield was the highest after 1915, 3 bu. above 1944 and 4 bu. above the ten-year aver-

U.S. Production of Barley by Leading States, 1945 and 1944

age of 22.3 bu. per acre. The season was very favourable, especially in the heavy producing states of the north central area. In North Dakota, the leading barley producing state, the average yield per acre was 24 bu. compared with 22.5 bu. in 1944 and a ten-year average of 18 bu. Wisconsin harvested a yield of 39.5 bu. per acre compared with 26.5 bu. in 1944 and Minnesota 29 bu. per acre in 1945 compared with 19.5 a year earlier.

(J. C. Ms.)

**Barros Camara, João de** (1894- ), cardinal archbishop of São Sebastião do Rio de Janeiro, was born at São José, state of Santa Catarina, Brazil, on Aug. 3. He was educated at Jesuit seminary of São Leopoldo, and was ordained in Jan. 1920. He served as rector of the diocesan seminary, and was consecrated bishop of Mossoro in 1935. He was elevated to the archbishopric of Belem do Pará in 1940, and was transferred to see of São Sebastião do Rio de Janeiro in 1943. Known as an able organizer, orator, historian and administrator, the archbishop established a record in the development of seminaries and charitable works. Aside from his pastoral duties, he found time to carry on research concerning the history of the church in Brazil. On Dec. 23, 1945, it was announced that Archbishop Camara had been appointed to the Sacred College of Cardinals. He was created and proclaimed cardinal at consistory on Feb. 18, 1946.

**Bartók, Béla** (1881-1945), Hungarian composer, was born March 25 in Nagyszentmiklós, formerly in the Hungarian district of Torontal which later became part of Yugoslavia. For his early career, see *Encyclopædia Britannica*. He early came under the influence of the famous French com-

poser, Claude Debussy, and accordingly turned to modern compositions, becoming one of the vanguard of "neo-classicists." At the same time, he began to use the ancient scales he discovered in his research on old Hungarian folk music and adopted a 12-tone scale which afforded many new harmonic combinations. Bartók made his debut in the United States in 1927 as soloist with the Philharmonic orchestra and presented his own *Rhapsodie, Op. 1*. Later, he appeared with Joseph Szigeti in a concert devoted largely to his own compositions. In 1939, Bartók's concerto for violin and clarinet was played by Szigeti and Benny Goodman at Carnegie hall. In 1940, Columbia university awarded him the degree of doctor of music and commissioned him to transcribe the vast Milman Parry collection of Yugoslav folk-music recordings. A prolific composer, his stage works include: *The Wonderful Mandarin*, pantomime, *The Wooden Prince* and *Prince Bluebeard's Castle*. His orchestral works include *Dance Suite*, *Hungarian Folk Songs*, *Two Portraits* and *Two Pictures*. He also wrote a number of piano pieces based on folk melodies, choral works, violin compositions and revised orchestral arrangements for his earlier works. Bartók, who resided in the United States after 1940, was elected a member of the Hungarian parliament in absentia. He died in New York city, Sept. 26.

**Basalt:** see STONE.

**Bascom, Florence** (1862-1945), U.S. geologist and educator, was born July 14, in Williamstown, Mass. She was graduated from the University of Wisconsin in 1882 with an A.B. degree and took her A.M. in 1887. She was the first woman to win a Ph.D. degree from Johns Hopkins university, 1893. In the same year, Dr. Bascom became instructor in geology and petrography at Ohio State university. She joined the Bryn Mawr faculty in 1895 as lecturer and associate professor in geology, later becoming professor and serving in that capacity until her retirement in 1928. She was a member of the U.S. Geological Survey, 1896-1936, an associate editor of the *American Geologist*, 1896-1905, a fellow of the Geological Society of America as well as a member of numerous scientific societies. She died in Williamstown, June 18.

**Baseball.** Baseball in the United States played through its final year of World War II under a new leader. The death of Kenesaw Mountain Landis, who served as commissioner of baseball from Jan. 12, 1921, left a vacancy which was filled on April 24, 1945, with the selection of Albert Benjamin Chandler, Democratic senator from Kentucky and that state's former governor. Before the year was out Commissioner Chandler had rearranged the official family of the game. Walter Mulbry, a political associate, had moved in as secretary-treasurer and Herold (Muddy) Ruel, former catcher and Chicago White Sox coach, had taken over the duties of special assistant to the commissioner.

Leslie M. O'Connor, Chicago attorney associated with the late Judge Landis throughout his career at baseball's helm, served as special assistant to Chandler until a substitute could be named for him. Upon vacating that office, he assumed the role of general manager of the Chicago White Sox in the American league, a post left open by the retirement of Harry Grabiner.

There were important changes in several other major league clubs during 1945. The New York American league club (the Yankees), which had grown to fabulous strength and dominance under the ownership of the late Colonel Jacob Ruppert and the guidance of Edward G. Barrow, was sold (the full Yankee empire of farm clubs in Newark, N.J., Kansas City, Mo., and other cities figured in the deal) to a syndicate headed by Colonel

WITH FINGERS CROSSED and pigtailed flying, Francine Tomlin, 10, of Death Valley A.C. makes a practice catch during the Philadelphia sandlot baseball tournament in 1945

Larry S. MacPhail, former general manager of the Cincinnati Reds and Brooklyn Dodgers; Dan Topping, well-known sportsman, and Del Webb, western business man. The reported price for the Yankees was \$2,800,000.

In St. Louis, Mo., Donald L. Barnes, president of the St. Louis Browns, winners of the American league championship in 1944, sold his stock and turned over his presidency to Richard C. Muckerman. In Boston, Mass., the Braves were put under the orders of John Quinn, son of Robert, whose place he assumed. In Detroit, Mich., Jack Zeller concluded his career in front-office direction in a pennant-winning year for the Detroit Tigers. When he turned in his resignation to W. O. Briggs, Sr. after the Tigers beat the Chicago Cubs in the world series 4 games to 3, Briggs named George Trautman, president of the American association, AA minor league, to the post. Trautman's chair was immediately filled by Roy Hamey, of the Kansas City Blues.

There were changes, too, in the dugouts of major league clubs. Freddie Fitzsimmons started the season as pilot of the Philadelphia Phillies and turned over his job in midseason to Ben Chapman. The latter, a star infielder and outfielder with the New York Yankees, returned to the minor leagues several years before, served as a manager, became a pitcher and came back to the majors in Brooklyn. Traded to Philadelphia, he was named manager when Fitzsimmons resigned.

The Boston Braves had three managers during the year but only two during the playing season. Bob Coleman began the year as the dugout leader of the Boston National league club and, when his team became bogged in the second division, he suggested a new man take his place. Quinn placed Del Bissonette, Coleman's first lieutenant and a former star with the Brooklyn Dodgers, in charge.

At the end of the year, however, it was announced that a new leader would be selected. Numerous candidates were rumored, among them Bill Terry, who had piloted the New York Giants to three championships; Lieutenant Bill Dickey, U.S.N.R., prewar Yankee catcher, and Dick Bartell, former shortstop of the Cubs, Giants and Tigers, who was discharged from service just before the world series.

But when the announcement of the new manager came, it was one of the biggest surprises in the history of baseball. Billy Southworth, who had managed the St. Louis Cardinals from 1940 and had led them to successive pennants in 1942, 1943 and 1944 as well as world crowns in '42 and '44, was picked after the Boston club had received permission from Sam Breadon, Cardinals' president, to offer a contract to him. Eddie Dyer, former Cardinal player and long a vital cog in the Redbirds' vast farm system, was named to succeed Southworth in the Sportsman's park dugout.

For all of this off-the-diamond activity the playing season, itself, could not be thrown into the background as two of the greatest pennant races in history threw the Cubs, of the National league, and the Tigers, of the American league, into a seven-game conflict for the world's championship. Attendance records were set both during the regular season and in the world series.

Four clubs drew more than 1,000,000 fans to their home parks. The American league, paced by Detroit's attendance of 1,280,341, drew a total of 5,580,020, its league record. The National league had three teams over the 1,000,000-fan mark, the first time this had ever been accomplished in either circuit, as the Cubs, Brooklyn Dodgers and New York Giants all topped that figure. The league's combined attendance, according to an Associated Press survey, was 5,372,819, the senior circuit's top figure after 1930 and a gain of almost 1,200,000 over the 1944 turnstile count.

Twelve leagues were active in the minors during 1945, the International league, American association and Pacific Coast league, in AA; the Southern association, in A-1 (raised to AA during the year); the Eastern league, in A; the Inter-State and Piedmont leagues, in B; the Carolina league, in C, and the Appalachian, Pony, North Carolina state and Ohio state, in D. It was estimated by the office of Judge William G. Bramham, president of the National association, that a total of 10,000,000 fans had watched minor league baseball during the year and at the winter meetings in Columbus, O., more than 30 leagues announced they would resume postwar activity in 1946.

A comparison of the major league attendances at each of the major league parks for 1943-45 may be found in Table I.

Table I.—Major League Attendance Figures, 1945, 1944 and 1943

\*Gain of approximately 22% over 1944 attendance total.

The annual major league All-Star game, usually played early in July and from which the proceeds during World War II were turned over to war charities, was not staged in 1945 because of Office of Defense Transportation restrictions on travel. In place of this classic, seven interleague games were played and the receipts were given to the American Red Cross and other charities.

The American league won five of the seven games which netted the war charities more than \$250,000. The New York Yankees defeated the Giants at the Polo grounds, 7 to 1. The Chicago Cubs fell before the White Sox at Comiskey park in ten innings, 5 to 4; the Washington Senators were hosts to the Brooklyn Dodgers and defeated them, 4 to 3, with Lieutenant Bert Sheppard, one-legged war hero, pitching four innings and getting credit for the victory. At Fenway park in Boston, the Red Sox defeated the Braves, 8 to 1. In St. Louis, the Browns used nine pitchers, each working an inning, and the Cardinals were held to two hits and shut out, 3 to 0. The only National league triumphs were scored by the Cincinnati Reds at Cleveland, 6 to 0, and by the Phillies over the Athletics in Philadelphia's Shibe park, 7 to 6. The crowds and net receipts for these games are shown in Table II.

Fittingly enough, the world series of 1945, an exciting con-

flict which presented, among other episodes, a bizarre sixth game in which 19 players participated for each side, and in the third game the greatest pitching performance ever exhibited in world series play, set attendance and gate receipts marks which had never been equalled. Even before the seventh game had been played this was the richest series and the final contest at Wrigley field smashed the old turnstile count. The final figures were 333,457 paying fans, \$1,592,454 (including \$100,000 radio rights). The old standards were 328,051 who watched the Yankees play the Cardinals in 1926 and the \$1,322,328 realized at the 1940 Tigers-Cincinnati Reds series of 1940.

**The Pennant Races.**—The 1945 pennant races were bristling down-to-the-wire battles, the American league championship being awarded on the final day of the campaign and the National league title being clinched by the Cubs just a day earlier. There was a unique situation in the American league race, for the Washington Senators, last-minute challengers of the Tigers were idle throughout the final week of the season. Finishing their schedule one game behind the Bengals with a week to go, the Senators moved to the Bainbridge naval training station to keep in shape for a possible play-off or, perhaps, the elimination of the Tigers. Neither event occurred, however, and the Tigers, holding their slim lead, went on to win the world's championship.

Detroit led in the American league race from June 12 to the clinching. Although Washington moved to within a half-game of the top on several occasions, they never were in first place at any time during the 154-game campaign. (Oddly enough, the defending St. Louis Cardinals, only real threat to the Cubs' triumph, also played throughout the season without acquiring part or sole possession of first place.) Before June 12 several American league clubs held temporary leads—Chicago, Detroit and New York.

The White Sox opened with five straight victories and were a threat at the getaway. By the first week of June, however,

ROY HUGHES, shortstop for the Chicago Cubs, being called out when he attempted to gain an extra base on a two-base hit in the sixth game of the 1945 World Series on Oct. 8, 1945. The Chicago Cubs won the game, but lost the series on Oct. 10, four games to three. Cub manager Charlie Grimm (40) watches play

the Yankees had taken over. On June 8, the Tigers got their first hold on first place but by June 10 the Yankees were back in front. Then on June 12, with Hal Newhouser, the Tigers' spectacular southpaw, winning an 11-inning battle from the St. Louis Browns while New York was losing to Washington, Detroit moved in front, never to be headed.

Early in July Washington began to move up to the challenging position. A last-place team in 1944, the Senators combined good knuckle-ball pitching with speed on the base paths and jumped to within two and one-half games of the top late that month. Detroit had a four-game margin Aug. 1, yet dropped to within a half-game of the Senators by Aug. 5. It was a two-team battle by mid-August when the Senators took three out of four in a series with the Tigers and five out of six from Cleveland.

Returning from service with the navy, Bob Feller tossed his weight into the battle for Cleveland in late August and, although the Indians were out of it, his first victory over Detroit helped lift the Senators to within that stubborn half-game margin once more. By evening of Labor day, Detroit's lead was two games and time was running out for the Nats. When another dischargee, Walt Masterson, pitched a two-hitter and defeated Feller in an early September battle, the Senators had moved once again that scant half-game away. Finally on Sept. 15, the two leaders met in a five-game series with the pennant on the line. Detroit won three of the five games and left Washington leading by a game and a half. Washington was still a game out when it reached the end of its schedule and sat around waiting for disaster to overtake the Tigers.

But the Tigers hung on and finally clinched it the last day of the season—and in dramatic fashion. Hank Greenberg, another dischargee from service who was to play an important role in the world series, smashed the decisive blow. With his team trailing the St. Louis Browns by a run in the last inning of a game in St. Louis, Hank rocketed a grand slam home run into the left field bleachers. And that was the pennant!

The hustling getaway gallop of the White Sox in the American league was a brief spurt compared with the meteoric opening bid of the New York Giants in the National league. Under the spirited leadership of Mel Ott, erstwhile boy wonder, the venerable players from the Polo grounds won 25 of their first 32 games. It was a start which had not been matched in three decades of National league play and placed the Giants in an enviable position, six and one-half games ahead of their nearest rival on May 26. Thereafter the fortunes of the Giants faded and by the end of the season they were a mere four games over the .500 mark, a disappointing fifth in the league standings.

But that surprising Giants' move to the top did much to enliven the race in its early stages. It was not until mid-June that the Giants sank out of the lead. Then the Pittsburgh Pirates took over briefly. The Brooklyn Dodgers displaced them and on July 4, which tradition says is the day when champions are crowned, they were in front. But tradition was kicked around once again, for on July 8 the triumphant Cubs made their bid during a successful eastern trip, grabbed first place and stayed there until the end of the season.

Holding the lead was not as easy as it sounds, however. Time and again the Cardinals challenged and were turned back. The purchase of Hank Borowy, who had won ten games for the Yankees in the American league, was a master stroke—the turning point in the pennant fight. Borowy reported late in July and not only led the National league pitchers in the earned-run-averages lists and the won-and-lost percentage columns, but won three vital games from the Cards. In fact, he was the only Cub pitcher who beat the Redbirds over the last half of the season. St. Louis set an all-time record by winning 16 games

from the pennant-winning club, losing only 6.

At one time the Cubs held a seven and one-half game lead over the Cards. That was their longest margin. That lead dwindled to a mere one and one-half games in the closing weeks of the race. Labor day was a happy one for the Cubs. They beat the Reds twice (Chicago won 21 out of 22 from Cincinnati during the year) and the Pirates turned back the Cards in both ends of a double-header. That gave the Cubs a four-game advantage and probably saved the pennant for them when St. Louis made its traditional late rush in an attempt to acquire its fourth straight flag. The clinching was done on the next-to-last day of the season. Three games up and three to play, the Cubs beat the Pirates in the first half of a double-header. And the starting and winning pitcher in that game? Borowy, of course.

The final standings of the clubs in the two league races follow:

National League												
Club	Chi.	St. L.	Bkn.	Pitts.	N.Y.	Bost.	Cin.	Phila.	Won	Lost	Pct.

The World Series.—The last of the World War II world series may have lacked something in the quality of play but it was packed with thrills from start to finish and the record gathering of fans who watched the first three games in Detroit and the last four in Chicago carried away memories which would remain with them for many years.

The scores of the 1945 games were: First game, Cubs 9; Tigers 0; Second game, Tigers 4; Cubs 1; Third game, Cubs 3; Tigers 0; Fourth game, Tigers 4; Cubs 1; Fifth game, Tigers 8; Cubs 4; Sixth game, Cubs 8; Tigers 7 (12 innings); Seventh game, Tigers 9; Cubs 3.

This was Detroit's seventh appearance in world series competition and its second world crown. By winning in 1945 Steve O'Neill repeated the 1935 victory scored by Mickey Cochrane over another Cubs' team, managed as was the 1945 ensemble by Charlie Grimm. For the Cubs the '45 pennant was the 16th in the history of the club, six titles being won in the pre-world series era. For O'Neill this was his first league championship, for Grimm it was number three.

The Tigers were out of the first ball game soon after it started. The Cubs scored four runs in the first inning. After one away, Don Johnson scratched a single through the box and stole second. After Peanuts Lowrey flied out, Phil Cavarretta beat out a slow roller to Eddie Mayo, the second baseman. Failure to nail Cavarretta on this close play was vital to the ball game. When one of Newhouser's pitches slipped past Paul Richards, Johnson scored from third and Cavarretta moved to second. Andy Pafko was intentionally passed and Bill Nicholson then pounded a two-run triple against the right field screen, a ball which many thought should have been caught by Roy Cullenbine. Nicholson also scored on a single by Mickey Livingston.

Four runs were in, therefore, before the Tigers came to bat and Hank Borowy coasted to victory. Newhouser was tagged for three more runs and removed in the third, Cavarretta added a home run against Jim (Flutter-Ball) Tobin in the seventh when the Cubs scored their last two runs in a 9 to 0 triumph. Borowy, hurling a six-hitter, went all the way and became the first pitcher since Jack Coombs to win world series games for both leagues. He had won for the Yankees in 1943 against the Cardinals. Coombs had scored series triumphs for the Athletics and Dodgers of an earlier era.

Virgil (Fire) Trucks, a fast-balling pitcher just out of the navy, who had returned to the Tigers a few days before the end of the season but was eligible for the series under a special ruling for returning servicemen, was too much for the Cubs to handle in the second game. In fact this contest was a triumph for two men discharged from military duty. While Trucks was throttling the Bruin batters, Hank Greenberg's three-run home run in the fifth won the ball game.

The Cubs went into that inning a run to the good. They had put over their lone tally in the fourth when Cavarretta doubled and Nicholson singled. Hank Wyse, the Cubs' leading winner of the regular season, had held the Tigers to two hits, both singles, over the first four frames and seemed in absolute control of the situation. Then the Tigers exploded. Wyse retired the first two men, Pafko making a great catch of an opening drive by Richards and Trucks popping to Johnson. But before he could get the next out of the inning, Wyse had lost the ball game. Skeeter Webb lined a single to left. Eddie Mayo walked on four pitches. Doc Cramer sliced a single over third, scoring Webb with the tying run. With the count at 1 and 1, Greenberg then won the game when he whaled a homer among the left field patrons.

The third game produced the masterpiece of world series pitching, a one-hit effort by Claude Passeau, of the Cubs, and a 3 to 0 triumph which sent the Bruins back to their home park, Wrigley field, one game ahead. There was nothing questionable about the single which robbed Passeau of his no-hitter. With two away in the second inning, Rudy York smashed a line-drive single to left centre. A speedier base runner might have made second on the blow.

Passeau retired the next batter, however, and not another Tiger reached first base until the sixth when Bob Swift, the catcher, walked. Red Borom, a substitute runner, took Swift's place at first base. With none away, the Tigers visioned a rally. But Hub Walker, batting for Lefty Overmire, Passeau's mound rival, hit into a fast double play and Passeau resumed his complete reign over the Bengals. The next ten men who faced him went down as they came up. Only 11 balls were hit out of the infield against Passeau.

There had been only one other one-hitter hurled in world series history. That, too, was credited to a Chicago Cubs' pitcher, Ed Reulbach, who produced it against the Chicago (Hitless Wonders) White Sox on Oct. 10, 1906. But Reulbach's game did not match Passeau's performance in all-around class for Reulbach walked six, hit one batter and, in fact, did not score a shutout, winning 7 to 1.

Although Overmire pitched a game which might have been good enough to win against less masterful flinging, he was beaten in this one as early as the fourth when he gave up two runs. Lowrey opened that inning with a double against the left field wall. Cavarretta sacrificed and, after Pafko walked, Nicholson's single scored Lowrey. A single by Roy Hughes then scored Pafko. The third Chicago run came over in the seventh on Livingston's double, a sacrifice and Passeau's scoring fly to centre.

As in the second game, the Tigers won the fourth on a four-run burst, doing all their scoring in one rally. This time it occurred in the fourth after Ray Prim, a venerable southpaw, had retired the first ten batters who faced him. With one away in that frame, however, Mayo walked, Cramer singled, Greenberg singled and Cullenbine doubled. Two runs were in and Prim was removed from the game. Paul Derringer replaced him and, after York had been intentionally passed, Jimmy Outlaw's forceout grounder scored Greenberg. A single by Richards then sent Cullenbine over the plate.

Meanwhile Paul (Dizzy) Trout, sturdy right-hander, was fashioning a five-hitter. Livingston singled in the third but the rally died. Johnson and Lowrey hit successive singles before an out in the fourth but Trout fanned two and slipped through, unscathed. In the sixth, by which time he had his four-run margin, he was tagged for a run when Johnson tripled to right centre and came over on an error by York. A pinch single by Paul Gillespie in the seventh was the only other safety off Trout and once again the series was all even.

Newhouser and Borowy, the first-game starters, were mound rivals once again in the fifth contest. Both gave up a run in the third, but the fuse was touched to Detroit dynamite in another four-run inning, the sixth, and Borowy was shelled to the dugout. Cramer singled and took second when the ball got through Pafko for an error. Greenberg blasted a double down the left field line, scoring Cramer. Cullenbine beat out an infield hit to Cavarretta and York's single scored Greenberg from third. Borowy was replaced by Hy Vandenberg, whose control was poor. After a sacrifice and an intentional base on balls filled the bases, Vandenberg walked Newhouser, forcing Cullenbine over the plate. York scored during an infield out for the fourth run of the inning. The Tigers scored one more in the seventh and two in the ninth. Although Newhouser was in trouble in the late innings, his robust batting support saw him through and he finished with a seven hitter.

The sixth game was the nightmare of the world series. Thirty-eight men, 19 for each team, played in this hectic game won in the 12th, 8 to 7, by the Cubs when Billy Schuster, a substitute runner, came all the way from first to home on Stan Hack's "single" to left which blossomed into a game-winning double as it bounced over Greenberg's head. At first this was scored as a single and an error for Greenberg, but late that night Martin J. Haley, of St. Louis, Ed Burns, of Chicago, and H. G. Salsinger, of Detroit, changed the official scoring decision and credited Hack with a two-base blow.

That was only one of the many bizarre episodes which occurred during and after this game. Early in the game it seemed the Cubs might win easily. Passeau, the one-hit hero of the third game, was back on the mound, opposing Trucks. Detroit scored a run in the second but Chicago countered with four in the fifth. Going into the sixth inning with a 4 to 1 lead, Passeau had another one-hitter rolling, York having doubled in the second.

But in the sixth Jimmy Outlaw sent a hot liner right back at the pitcher and, although Passeau knocked down the ball and threw the batter out at first base, a nail was torn loose from one of the fingers of his pitching hand. He got the Tigers out in that inning and tried to continue in the seventh but it was obvious he could put no "stuff" on the ball and after the Tigers had scored a run, he was removed.

The Cubs, as later events proved, got a terrific break in this sad seventh. Chuck Hostetler batted for Webb and was safe on an error. He reached second on an infield out and seemed a certain scorer on Cramer's single to left but as he rounded third and headed for home (through a "stop" sign by Steve O'Neill) he stumbled and fell. Before he could get to his feet again, the Cubs had the ball at the plate and Hostetler was run down for the second out of the inning. But Passeau couldn't hold the Tigers even with that stroke of good fortune. After he walked Greenberg and was touched for a run on Cullenbine's single, Wyse replaced him.

Wyse gave up one more run before the inning was concluded but the Cubs had added one in their half of the sixth and they also matched the two picked up by the Tigers in the seventh. Thus, they ventured into the eighth, leading by a score of 7-3. And then the ever-dangerous Tigers caught fire once again and tied the score. Wyse got off to a bad start in the eighth when he walked Swift. A pinch double by Walker past first base sent Swift to third. Hack fumbled Joe Hoover's grounder as Swift scored and Hoover reached first safely. Mayo's single scored Walker and sent Hoover to third but Mayo was out at second when he tried to stretch his hit. Prim relieved Wyse and on Cramer's fly, Hoover went over the

plate. With the bases empty, the Tigers still a run behind and the count 3 and 2, Greenberg came through with a home run smash to the left field stands which tied the score. The two teams moved through the next three rounds without scoring and then the Cubs got their winning break and the series was in a 3 to 3 deadlock. Borowy was the winning pitcher, having taken over for the Cubs in the ninth.

The four innings Borowy pitched that afternoon, however, proved a decisive disadvantage two days later when the seventh game was played. Grimm once again selected Borowy in this key game and it was his third trip to the mound in four days, in fact his third straight appearance in as many games. Borowy never had pitched as often. The schedule proved too rigorous and he was out of the last game, a beaten pitcher, before he retired a Tiger. Webb opened with a single to right. Mayo found the same hole for another safety. When Cramer scored Webb with a single over short, Grimm went out to the mound and accompanied Borowy to the dugout.

Derringer, usually a control pitcher, took over and was wild. After a sacrifice moved up the two runners, Derringer intentionally filled the bases with a walk for Cullenbine. He worked hard on York and Rudy lifted to Hack. But Outlaw walked, forcing a runner over the plate and a double by Richards cleared the bases. Five runs were in and the series was decided right there. Newhouser was reached for ten hits, as compared to nine picked up by the Tigers, but won easily, 9 to 3.

**Individual Achievements.**—The second Kenesaw Mountain Landis Memorial Trophies were awarded in 1945. They were made to men voted the most valuable players in the two leagues by the Baseball Writers Association of America. The National league award went to Phil Cavarretta, batting champion and captain of the pennant-winning Chicago Cubs. In the American league Hal Newhouser, southpaw pitcher and the circuit's top winner, won for the second successive year.

Both received decisive margins. Cavarretta led Tommy Holmes, the Boston Braves' home run champion, 279 to 175. Cavarretta received 15 first-place votes, seven seconds and one fifth and was unnamed on only one of the 24 ballots cast. Newhouser, also left off one ballot, received 236 votes against 164 for his team mate and second baseman, Eddie Mayo.

The two committees, both presided over by Martin J. Haley, retiring president of the association were as follows:

The chief individual honours in the National league fell to members of the first-place Chicago Cubs. Cavarretta was the batting champion with an average of .355. Borowy was the leading pitcher with 11 won, 2 lost for the top percentage of .846 and also led in earned runs with an average of 2.14. (He won 10, lost 5 in the American league.) Holmes, of the Braves, led in home runs with 28. Walker, of the Dodgers, was the run-batted-in pace-setter with 124.

In the American league the batters did not frolic as of old. It was a pitchers' league. George Stirnweiss, of the New York Yankees, won the batting crown with a mere .309, lowest winning average since Elmer Flick, of Cleveland, won the 1905 title with .306. Vern Stephens, the St. Louis shortstop, won home run honours with 24 circuit smashes. In pitching, Newhouser, with 25 victories and 9 defeats for a .735 percentage and the low earned-run average of 1.81, was outstanding.

There was only one no-hit, no-run game pitched during the 1945 season and it was performed by Dick Fowler, of the Philadelphia Athletics, against the St. Louis Browns. The score was 1 to 0. Fowler, discharged by the Canadian army only three weeks earlier, hurled his masterpiece Sept. 9 at Shibe park in the second half of a double-header.

Ten more names were added to the Hall of Fame by the permanent committee which selected Jimmy Collins, considered by many the flashiest third baseman of all time; Dan Brouthers and Ed Delahanty, two of the game's greatest sluggers; James (Orator) O'Rourke, Roger Bresnahan, Wilbert (Uncle Robbie) Robinson, Fred Clark, Hughie Jennings, Hugh Duffy, whose .438 average had never been topped in any season, and Mike (King) Kelly.

Branch Rickey, president of the Brooklyn Dodgers in the National league and head of that club's growing farm system, threw something of a bombshell into the baseball world during 1945 when he signed a Negro shortstop, Jack Robinson, former University of California (Los Angeles) football star, to a Montreal contract. He was the first Negro signed to a contract for organized baseball in modern times. Robinson had played shortstop for the Kansas City Monarchs in a Negro league and while Rickey was scored for "raiding" that circuit, his move was hailed as one which would open the way for numerous Negro stars to join professional baseball ranks.

**The Minor Leagues.**—In the minors only four of the pennant-winning clubs also won the Shaughnessy play-off series. These were Lancaster of the Inter-State league; Danville, of the Carolina league; Kingsport, of the Appalachian league and Batavia of the Pony league. Louisville of the American association, and Newark of the International league clashed in the little world series and the former was returned the winner, 4 games to 2. Following are the pennant and play-off winners in the 12 minor leagues active during 1945:

CLASS AA			
American association . . . . .	Pennant Winner	Play-off Winner	
International league . . . . .	Milwaukee	Louisville	
Pacific Coast league . . . . .	Montreal	Newark	
	Portland	San Francisco	
CLASS A-1			
Southern association . . . . .	Atlanta	Mobile	
CLASS A			
Eastern league . . . . .	Utica	Albany	
CLASS B

During the annual winter meetings of the major league moguls at Chicago, the Pacific Coast league, through its president, Clarence (Pants) Rowland, sought to be admitted as a third major league. The request was turned down although the majors admitted the P.C.L. was "potential major league territory." A request to raise the P.C.L., International league and American association from AA to AAA, a new baseball classification, was okayed. (A. E. Pn.)

**Basilone, John** (1918?-1945), U.S. marine, served for three years with the peacetime army in the Philippines. In 1943, he was awarded the Congressional Medal of Honor, the first enlisted marine in World War II to be so honoured. He received the decoration for heroism in the defense of Henderson field on Guadalcanal, when, in Oct. 1942, he and two machine-gun sections held off for two days a large force of Japanese attempting to retake the airstrip. Sgt. Basilone himself slew 38 Japanese soldiers that attempted to take his emplacement. The citation read that he "contributed in a large measure to the virtual annihilation of a Japanese regiment." When he was returned to the U.S. in 1943, his home town of Raritan, N.J., gave him a hero's welcome. Sgt. Basilone, at the behest of the treasury department, toured the eastern states during a war bond drive. He then asked for reassignment to combat duty, declaring his ambition was to participate in the recapture of Manila. The marines were assigned instead to seize Iwo Island and Sgt. Basilone was killed by Japanese artillery fire, Feb. 19, 1945, in the first day of fighting for the volcanic isle as he was leading his machine-gun platoon.

**Basketball.** Oklahoma Agricultural and Mechanical college, Stillwater, reached the pinnacle of intercollegiate basketball during 1944-45 with a conquest of DePaul university, Chicago, Ill., in the annual Red Cross play-off game and, in the process, staked first claim to the national championship. Oklahoma A. & M. first took charge of the National Collegiate Athletic association tournament with a 49-45 conquest of New York university, New York city, in the final. DePaul qualified for the Red Cross final with a triumph in the national invitational, defeating Bowling Green, Ohio, in the final, 71-54.

Led by seven-foot Robert Kurkland, Oklahoma A. & M. won the Red Cross classic with a 52-44 victory over DePaul, manned chiefly by six-foot, nine-inch George Mikan.

Army (U.S. Military academy, West Point), St. John's university, Brooklyn, and the University of Pennsylvania, Philadelphia, dominated eastern basketball. Army was judged the leading team on the Atlantic coast, while St. John's won its second straight Metropolitan title. Pennsylvania interrupted a string of seven consecutive championships for Dartmouth college, Hanover, N.H., by winning the Eastern League crown. The University of Iowa, Iowa City, captured its first Big Ten championship, winning 11 conference games and losing 1 to the University of Illinois, Urbana. The University of North Carolina, Chapel Hill, replaced Duke university, Durham, N.C., as basketball ruler of the south, while the University of Kentucky, Lexington, repeated in the southeast and Rice institute, Houston, Texas, dominated the southwest. Iowa State, Ames, captured the Big Six championship; Oklahoma A. & M. won in the Missouri valley; the University of Utah, Salt Lake City, in the Big Seven; the University of Oregon, Eugene, in the Pacific coast northern division; University of Southern California at Los Angeles in the Pacific coast southern division.

The intercollegiate season was marred by a betting scandal which drew nation-wide notoriety. Five members of the Brooklyn college basketball team were expelled from school for accepting a bribe, and two gamblers, Henry Rosen and Harvey Stemmer, were sentenced to one year in jail and fined \$500.

Phillips "66" of Bartlesville, Okla., won its third straight American Athletic union championship with a 47-46 conquest of the Denver Ambrose in the final. Trailing by 14 points with ten minutes to play, Phillips "66" rallied to overtake the Denver team in the closing minute. Gale Bishop of Fort Lewis, Wash., set an A.A.U. tournament scoring record with 62 points against the Hoxie, Kan., chamber of commerce.

The Nashville, Tenn., Vultrees retained their women's A.A.U. championship with a 22-20 victory over Little Rock, Ark., in the final. Once again 22 teams entered the annual women's tournament.

The Fort Wayne, Ind., Zollners again dominated professional basketball by capturing both the World and National League championships. The Philadelphia, Pa., Sphas won the American League title.

\*A number lacking a decimal is an estimate.

After the peak World War II demand for aluminum had passed, production of bauxite was cut back sharply by all United Nations producers. Axis supplies dropped in about the same

PRACTICE SHOOTING at the "Keaney ring," which makes a smaller basket opening, developed the accuracy of St. John's university (Brooklyn, N.Y.) basketball team during 1945

proportion, but for a different reason—lack of ability to keep up the pace. The bulk of the axis supply came from France and Hungary. German controlled expansion of the French output was one of the best records made in any occupied area. During the war Gold Coast developed into an important producer, and Northern Ireland also made a good showing. Active development of prospects were being made in Haiti and Jamaica, and exploration was being done in Nigeria and Venezuela.

**United States.**—The salient features of the bauxite industry in the United States are outlined in Table II.

Table II.—Data of Bauxite Industry in the U.S., 1940-44

		(Thousands of short tons)				
		1940	1941	1942	1943	1944

At the close of World War I it was widely believed that the cream had been so thoroughly skimmed from the bauxite reserves that the United States would never again be able to equal the peak war output of 678,000 tons. How well this was accomplished was demonstrated by the figures above. Not only was the demand for immediate use fully met, but at the end of the war surplus stocks had been accumulated to the extent of 1,364,200 tons at mines, processing plants and consumers' plants, and some 3,000,000 tons in the hands of the Metals Reserve company.

(G. A. Ro.)

**Beans, Dry.** The 1945 crop of dry beans was estimated by the United States department of agriculture to be 14,191,000 bags of 100 lb. which is about 12% less than the 1944 crop of 16,128,000 bags and below the average of 15,942,000 bags in 1934-43. This was the smallest crop after 1936. The season was generally unfavourable and while the acreage was about the average, 1,818,000 ac., the yield dropped to 781 lb. per acre compared with 784 lb. in 1944 and an aver-

U.S. Production of Dry Beans in Leading States, 1945 and 1944

		(in 100-lb. bags)			
State	1945	1944	State	1945	1944
California . . .	3,546,000	3,843,000	Wyoming . . .	1,000,000	1,201,000
Michigan . . .	3,247,000	4,158,000	Nebraska . . .	780,000	588,000
Colorado . . .	1,909,000	2,088,000	New York . . .	679,000	731,000
Idaho . . . .	1,726,000	2,175,000	New Mexico . .	238,000	724,000

age of 872 lb. in 1934-43. Allowing for heavy cleaning losses the net crop of clean beans was only about two-thirds the average of 1941-43. The baby-lima crop of California was a half larger than the ten-year average but standard limas were less than in 1944. Harvest losses were very heavy in the eastern areas running as high as 20% for New York and Michigan.

(J. C. Ms.)

**Bechuanaland Protectorate:** see BRITISH SOUTH AFRICAN PROTECTORATES.

**Beef:** see MEAT.

**Beekeeping.** The crop of honey in 1945 was estimated at 225,779,000 lb. by the U.S. department of agriculture compared with 188,917,000 lb. in 1944, a gain of 20% and 16% above the five-year average. Favourable weather resulted in the largest yield per colony of bees after 1941. The average production was 41.3 lb. per colony compared with 36.3 lb. in 1944. The record was made in 1941 when the yield was 49.6 lb. per colony. The number of colonies of bees was also an important factor in the increased production, being 5,566,000 in 1945 compared with 5,217,000 in 1944 which was 24% above the low year 1939. About half of the 1945 honey crop was produced in the leading beekeeping states of Minnesota, Iowa, Cali-

fornia, Wisconsin, Ohio, New York, Florida, Michigan, Illinois and Texas, ranking in the order named. California had a poor year and for the first time on record failed to lead in honey production. Beekeepers had difficulty in obtaining sugar for winter feeding and retained more honey than usual for wintering. The demand for honey was active and commercial stocks on hand at the end of 1945 were smaller than in 1944. Honey prices were well sustained during 1945 due to the shortage of sugar.

**FILMS.**—*Honey Bee* (Encyclopædia Britannica Films Inc.). (J. C. Ms.)

**Beer:** see BREWING AND BEER.

**Beer-Hofmann, Richard** (1866-1945), Austrian poet and playwright, was born July 11 in Vienna. He was forced into exile by the nazis and went to the United States as a refugee. Beer-Hofmann, rated by Arthur Schnitzler and Hugo von Hofmannsthal as one of the great contemporary poets writing in German, was also one of the slowest workers on record. According to some versions, his average pace was reported at six words a day. His second play, *The Young David* (1934) took him 25 years to write; the one and one-half page preface required seven months to complete. In Vienna, Beer-Hofmann first attracted notice with his *Schlaflied für Mirjam* (Lullaby for Miriam) (1919), a poem in four stanzas. Among his other works are his verse plays *The Count of Charolais* (1904) and *Jacob's Dream* (1918). In 1944, he completed the first volume of his prose memoirs entitled *Herbstmorgen in Oesterreich*. Work on his second volume was interrupted by his death in New York city, Sept. 26.

**Belgian Colonial Empire.** The accompanying table gives material relative to the colonial and mandated territories administered by Belgium (q.v.). Total area 923,000 sq.mi.; total population (est. Dec. 31, 1941) 14,383,000.

**History.**—In April 1945 Pierre Ryckmans, governor-general, visited Brussels for discussions with the colonial minister, Edgar de Bruyn.

In October the general confederation of (white) trade unionists of the Congo met at Leopoldville and called for immediate enactment of the promised pensions law, for which provisional contributions were already being collected.

There was some demand among colonists for a greater say in the administration of the colony.

The cost of living for Europeans in the Congo, which in normal times is about 50% above Belgian levels, was roughly estimated to have doubled from 1935 to 1944, although strict price controls were in force. This increase was attributed approximately in the proportion of 50% to the fall in value of the Belgian franc in relation to the currencies of the Congo's existing chief suppliers (United Kingdom, United States, Argentina), 30% to the rise in export prices in those countries and 20% to the rise in freights.

Compulsory gathering of wild rubber by natives ceased on the day of the Japanese surrender. This uneconomic and unsatisfactory expedient was resorted to only as a desperate measure in 1942 when the Japanese had captured 90% of the world's normal sources of rubber. The results were impressive: the crop of wild rubber was 381 metric tons in 1942 (eight months); jumped to 7,161 in 1943; and further increased to 9,243 in 1944. By slaughter-tapping the output of plantation rubber was also raised from 694 metric tons in the last eight months of 1942 to 1,888 in 1944. New plantations, which were of course not yet in bearing, brought the area of cultivated rubber from 14,900 hectares in 1940 to 73,000 in 1944.

Beer (Elisabethville) . . . . .	9,550 hectolitres	23,685 hectolitres
" (Leopoldville) . . . . .	15,000 " "	118,868 " "
Soap . . . . .	4,989 metric tons	10,103 metric tons

FILMS.—*A People of the Congo*; *A Giant People*; *Pygmies of Africa* (Encyclopædia Britannica Films Inc.). (W. For.)

**Belgian Congo:** see BELGIAN COLONIAL EMPIRE.

**Belgium.** A country of western Europe, occupied by German troops from May 1940 to Sept. 1944; area 11,775 sq. mi.; pop. (est. Dec. 31, 1939), 8,396,276; chief towns (pop. Dec. 31, 1938): Brussels and suburbs (cap. 912,774); Antwerp (273,317); Ghent (162,858); Liège (162,229). Ruler: King Léopold III; regent Prince Charles (q.v.); prime minister: Achille van Acker; languages: French and Flemish; religion: Christian (mainly Roman Catholic).

**History.**—In protest against the disarmament of the resistance forces, their representative in the government, Fernand de Man, and the two Communist ministers had resigned in Nov. 1944. During the month there were demonstrations against the Pierlot government, and the chamber voted powers to ban public meetings. The disarmament proceeded smoothly none the less. In Feb. 1945 the Socialist ministers resigned after criticizing the government for failing to improve coal and food supplies, to suppress the black market and to punish traitors promptly. The outgoing Socialist minister of labour, Achille van Acker, became prime minister with special responsibility for the coal industry. His government still represented all shades of opinion.

On May 8 Allied troops freed King Léopold from internment in a castle near Salzburg. Although the charges of treachery brought against the king in 1940 had been sufficiently rebutted, two questions were again hotly debated when the news of his release arrived. These were whether the king acted most unwisely or even unconstitutionally in refusing to leave Belgium

in 1940 and whether he did all in his power to oppose the enemy during the occupation. Over these questions the Liberal, Socialist and Communist parties called for the king's abdication, but the Catholics were ready to welcome him back. The Catholic ministers resigned from the government for this reason in July and were replaced by Independents of Catholic leanings, Liberals and members of the resistance movements.

A new social security law, largely the work of M. van Acker, came into force on Jan. 1, 1945. From April, government direction of labour was enforced in essential industries and improved conditions were decreed for coal miners. From January to September unemployment was brought down from 309,000 to 112,000. Wages were increased a further 20% with the proviso that they should not be more than double the May 1940 level. In September a household re-equipment fund and other additional social services were inaugurated, the cost to be met by employers' payments at the rate of 1½% of all wages. Previous social services contributions already amounted to 15¼% from employers and 8¼% from employees.

Coal output rose from 1,037,000 tons for Jan. 1945 to 1,262,000 for August, but this was still only about one-half the 1939 rate, and the shortage was holding back many other industries, including steel, textiles and glass.

On Aug. 30, six finance bills were passed, estimated to bring in 50,000,000,000 belgas (\$1,136,000,000 at 44 belgas per U.S. dollar in 1945). Under lend-lease Belgium was the only country in Europe to give far more than it received; \$165,000,000 of goods and services were supplied to the U.S.A. against \$47,500,000 worth received. (W. For.)

**Education 1938.**—Primary schools 8,712; scholars 955,038; higher schools 273; scholars 86,279; universities (1937-38) 4; students 10,776.

**Banking and Finance.**—Revenue, ordinary (est. 1941) \$410,800,000; expenditure, ordinary (est. 1941) \$410,609,400; public debt (Dec. 31, 1939) \$2,003,500,000; notes in circulation (Aug. 1944) \$3,350,880,000; (Oct. 1944) \$472,920,000; gold reserve (July 31, 1944) \$732,350,400; exchange rate (average 1940): belga=16.88 cents U.S. (Conversion rate [Sept. 1945]: belga=2.288 U.S. cents.)

**Trade and Communication.**—External trade (merchandise): imports (1939) \$656,283,800; exports (1939) \$729,054,000.

**Communication and Transport.**—Roads, suitable for motor traffic (1939) 6,571 mi.; railways, open to traffic, main (1939) 3,190 mi.; airways (1938), distance travelled 1,457,050 mi.; passenger mileage 8,255,980 mi.; baggage mileage 172,799 ton mi.; mail mileage 86,434 ton mi.; newspapers 57,875 ton mi.; shipping (July 1, 1939) 450,199 gross tons; tonnage launched (July 1938-June 1939) 30,423 gross tons; vessels en-

GROUP OF BELGIAN CHILDREN sent to Switzerland by the Belgian Red Cross in 1945 for a three-month period. There, it was expected, they would recover somewhat from the effects of bombing and under-nourishment

tered, in net tons (monthly average 1938) 2,752,443; (July 1939) 3,087,542; cleared (monthly average 1938) 2,757,955; (July 1939) 3,089,747; motor vehicles licensed (Dec. 31, 1938): 155,174 cars; 77,600 commercial; 67,016 cycles; wireless receiving set licences (1938) 1,062,200; telephone subscribers, local (1938) 287,323.

**Agriculture, Manufactures, Mineral Production.**—Production 1939 (in short tons): wheat 384,703; oats 798,286; rye 385,144; potatoes 3,663,163; coal (1940) 28,224,392; pig iron and ferroalloys 3,371,936; steel 3,421,539; beet sugar (1940) 254,631; barley 56,217; butter 67,240; margarine 66,910; artificial silk 6,504. Industry and labour: industrial production (1929=100) average (1939) 83.3; (Jan. 1940) 79.1; number wholly unemployed (average 1939) 195,211; (March 1940) 163,598. (See also BELGIAN COLONIAL EMPIRE.)

**Bellamann, Henry** (1882-1945), U.S. author and musician, was born April 28 in Fulton, Mo. After completing his studies at the University of Denver, he went to Paris where he studied piano, organ and composition. After his return to the United States, he was dean of the School of Fine Arts, Chicora College for Women, at Columbia, S.C., 1907-24, and during this period wrote his first book *A Music Teacher's Note Book* (1920). He was chairman of the examining board of the Juilliard Music foundation, 1924-26, and dean of the Curtis Institute of Music, Philadelphia, 1931-32. Bellamann scored a sensational success with his psychological novel *King's Row* (1940), a grim and gloomy study of life in a small midwestern town in the horse-and-buggy era, which subsequently was made into a motion picture. His earlier works include two books of verse, *Cups of Illusion* (1923), *The Upward Pass* (1927), and the following novels: *Petenera's Daughter* (1926), *Crescendo* (1928), *The Richest Woman in Town* (1932) and *The Gray Man Walks* (1936). He later wrote *Floods of Spring* (1942) and *Victoria Grandolet* (1944). He was at work on a new novel at the time of his death in New York city, June 16.

**Benavides, Oscar R.** (1876-1945), Peruvian army officer and politician, was born May 18 in Lima, Peru. A student at the National Military school of Lima, he later went to France where he completed his military

training and spent five years in service with various branches of the French army. In 1913 he was named chief of the general staff of the Peruvian army, but was later dismissed by the Billinghurst government. Thereupon, Benavides became a leader of a revolutionary movement. The Billinghurst government was overthrown and Benavides became president of the military junta, 1914, and provisional president, 1915-16. He was later minister to Italy (1917-20), to Spain (1931) and to Great Britain (1932-33). His diplomatic assignments were said to have been initiated with the purpose of keeping him away from Peruvian internal politics. When the crisis developed over seizure of the Leticia corridor, Colombia's outlet to the Amazon, Benavides was immediately recalled and made commander in chief of national defense. The assassination of President Sánchez Cerro in 1933 and his own assumption of the presidency gave Benavides the means to settle the Colombian dispute peacefully, without resorting to war. His rule was marked by sharp suppression of popular rights and disregard for the 1936 elections, after which he ruled without congress until 1939, when new presidential elections brought Dr. Manuel Prado Ugarteche to the executive office. Benavides was raised to a field marshal in Dec. 1939 and later served as ambassador to Spain, 1940, and to Argentina, 1941. He died July 2, according to a Lima report.

**Benchley, Robert Charles** (1889-1945), U.S. humorist, was born Sept. 15 at Worcester, Mass. While a student at Harvard university, Cambridge, Mass., he was editor of its magazine, *The Lampoon*. After his graduation in 1912, he had a brief try in the advertising department of a publishing house in Philadelphia and later obtained a personnel job in Boston. He went to New York city in 1916 where he became associate editor of the *New York Tribune's* Sunday magazine and editor of the *New York Tribune Graphic* the following year. He was managing editor of *Vanity Fair*, 1919-20, dramatic editor of *Life* until 1929 and held a similar post with the *New Yorker* until 1940. Through many mediums as an author, playwright, actor, columnist, critic and radio star, he proved himself one of the top humorists of the U.S. His success was largely attributed to his sense of the absurd and the ordinary banalities of life as the man on the street lives it. His first professional stage appearance was in the *Music Box Revue*, 1923, and six years later he was introduced to Hollywood. His contract in the film capital called for his services not only as an actor, but as a writer and director as well. His skit, *How to Sleep*, won a Motion Picture Academy award for 1935. Among his best known published works are: *Of All Things* (1921), *Pluck and Luck* (1925), *The Early Worm* (1927), *The Treasurer's Report* (1930), *No Poems* (1932), *From Bed to Worse* (1934), *My Ten Years in a Quandary* (1936), *Inside Benchley* (1942) and *Benchley Beside Himself* (1943). He died in New York city, Nov. 21.

**Bendix, Vincent** (1882-1945), U.S. engineer and inventor, was born in Moline, Ill. He left home at 16 years of age, worked at various odd jobs, studied mechanics, built an automobile and marketed the Bendix self-starter. He applied his inventive ability to improving generators, radio direction apparatus for ocean-going vessels, magnetos, laundry machinery, landing gears, the four-wheel automobile brake and lastly the helicopter. He founded the Bendix corporation in 1929, but resigned in 1942 as chairman of the board to resume a more active part in the development of aviation. In June 1944 he formed Bendix Helicopter, Inc., which produced a four-passenger sedan popular-type helicopter, the manufacture

of which was expected to start after the war. Bendix founded and was sponsor of the Bendix transcontinental air race, was donor of the Bendix trophy and donor of a trophy awarded for soaring competitions held annually at Elmira, N.Y. He died in New York city, March 27.

**Benefactions:** *see* DONATIONS AND BEQUESTS.

**Benton, William** (1900— ), U.S. government official, was born April 1 in Minneapolis, Minn., son of Charles William Benton and Elma (Hixson) B. Both of his parents were educators. He was graduated from Shattuck Military academy, Faribault, Minn., and received the bachelor's degree from Yale university, New Haven, Conn., in 1921. Benton entered the advertising agency business in New York in 1922. In 1929, in partnership with Chester Bowles, he founded the Benton and Bowles agency, which rose rapidly to become one of the most successful in the advertising business. He resigned the active direction of the agency in 1935, and in 1937 became vice-president of the University of Chicago.

At the university Benton devoted himself to the development of radio and classroom motion pictures as instruments of education. In 1943, when the university acquired Encyclopædia Britannica, Inc., he became chairman of the board of directors of Britannica. In collaboration with Paul Hoffman he founded (and served as vice-chairman of the board of trustees) the Committee for Economic Development, which instituted studies and plans for reaching and maintaining high levels of employment and productivity in the postwar period.

Benton was appointed assistant secretary of state, in charge of public affairs, on Sept. 1, 1945, and, after confirmation by the senate, was sworn in on Sept. 14. He was given responsibility for the domestic information work of the department; for the proposed program of international information and cultural relations; and for U.S. participation in the United Nations Educational, Scientific and Cultural organization. By executive order of the president, the state department was given responsibility for the overseas work of the Office of War Information and the Office of Inter-American Affairs, with a mandate to give the peoples of other nations "a full and fair picture of American life and of the aims and policies of the United States government." At the end of the year Benton had a plan for a permanent Office of International Information and Cultural Affairs, for submission to the president and congress, which would employ about 2,000 people, about 450 of them abroad, and would include maintenance of U.S. libraries of information abroad; short-wave broadcasting; use of documentary motion pictures, exhibits and film strips; and stimulation of the exchange of students, scholars, scientists and technicians.

**Bentonite.** Sales of bentonite in the United States made a heavy increase in 1944 to 546,768 short tons, against 480,202 short tons in 1943, an increase of 14% in quantity, while value rose 20%. Most of the increased demand was in drilling mud for oil wells. All of the increase in output came from South Dakota and Wyoming. (*See also* FULLER'S EARTH; MICA.) (G. A. Ro.)

**Bequests, Philanthropic:** *see* DONATIONS AND BEQUESTS.

**Berlin.** The residence of Hohenzollern electors, kings and emperors from 1442 to 1918, and capital of the German reich after 1871, Berlin is the largest and most important city of Germany. Reorganized in 1920 to include several suburbs, greater Berlin in 1939 had an area of 332 sq.mi., and a population of 4,332,000. It was the centre of Germany's rail, highway and air lines, and enjoyed cheap water transportation

through Germany's wide-reaching system of rivers and canals. During World War II, and especially in the early part of 1945, Berlin was subjected to very intensive Allied attacks of explosive and incendiary bombs, which completely destroyed most of the centre of the city containing the official government buildings, main banking institutions and large commercial houses. The suburbs suffered somewhat less, but it was estimated that altogether 80% of the residential buildings were damaged and 20% rendered uninhabitable. In spite of this, Berlin was estimated to have a population of 3,200,000 at the end of 1945. Berlin was divided in June 1945 into four zones, each governed by one of the four principal Allied powers, and was the seat of the Allied control council for the military government of all Germany. (*See also* GERMANY.)

**Berlin Conference.** On July 17, 1945, the heads of government of the United States, the soviet union and Great Britain met in the Potsdam district outside Berlin to determine policy in the light of the unconditional surrender of Germany May 8, 1945. The principals were President Harry S. Truman, Generalissimo Joseph V. Stalin, Prime Minister Winston Churchill and Clement Attlee, who became prime minister after the results of the British general election were announced July 26. They were accompanied by their foreign secretaries, James F. Byrnes, V. M. Molotov and Anthony Eden, the chiefs of staff, and other advisers. Eden was later succeeded by Ernest Bevin.

On Aug. 2 the Tripartite Conference of Berlin ended and released its report signed by the three government heads. Important decisions announced were the establishment of a council of foreign ministers of the three powers, China and France; agreement on the treatment of Germany in the initial control period; and a detailed plan for the settlement of reparations claims.

In effect the establishment of a council of foreign ministers provided for a continuing series of international meetings to resolve international problems. As its first task the council was charged with the drafting of peace treaties with Italy, Rumania, Bulgaria, Hungary and Finland for submission to the United Nations. The council was also directed to propose territorial settlements and prepare for eventual peace with Germany.

The conference report reiterated the Crimea declaration, stating that measures would be taken to assure that Germany never again would threaten its neighbours or the peace of the world, but repeating that it was not the victors' intention to destroy or enslave the German people. The conference set forth the principles by which the Allied control council was to be guided. These were: Germany's complete disarmament and demilitarization; destruction of its war potential; rigid control of permitted industry; decentralization of its political and economic structure. Naziism was to be uprooted and utterly destroyed and the German general staff broken up for all time. Agriculture and peaceful domestic industries were to be encouraged.

Although there was to be no central German government for the present, local self-government and free elections were directed restored, a degree of free speech, press, religion and free trade unions were to be allowed consonant with the Allied intent to reconstruct German life on a democratic basis and prepare Germany for eventual acceptance among the free and peaceful peoples of the world.

The conference agreed in principle on reparations providing that claims would be met by German assets abroad and by removals from Germany. It was specifically stated, however, that removals should leave enough resources to enable the German people to subsist without external assistance.

Transfer of Germans from Poland, Czechoslovakia and Hun-

gary was agreed upon as necessary, but it was directed that this be effected in an orderly and humane manner and with special regard to the equitable distribution of the transferred Germans in the several occupation zones.

Pending final determination of territorial questions at the peace settlement, the conference agreed in principle to the ultimate transfer to the soviet union of the city of Koenigsberg and its adjacent area and to the administration by Poland of certain former German territories.

The Allied press welcomed the assurance that its representatives would be free to report developments in Poland, Rumania, Bulgaria, Hungary and Finland.

Considerable comment was occasioned by the declaration that the three powers would not favour any application for United Nations membership put forward by the existing Spanish government, "which, having been founded with the support of the Axis powers, does not, in view of its origins, its nature, its record and its close association with the aggressor states, possess the qualifications necessary to justify such membership."

Subsequent events disclosed that the conference had had a direct and compelling effect on the war in the Pacific. While the conference report had ended with a cryptic reference to meetings on "military matters of common interest," on Aug. 3 it was announced that during the conference Truman and Attlee had approved "powerful new blows" to speed the defeat of Japan. On Aug. 6, homeward bound on the U.S.S. "Augusta," President Truman announced the most powerful blow of the war, the dropping of an atom bomb on Hiroshima. When the soviet union declared war on Japan on Aug. 8, Molotov revealed that during the conference Japan's mid-July request for soviet mediation for a cessation of hostilities had been discussed. Finally, the Potsdam declaration which had been issued July 26 under the signatures of President Truman and Prime Minister Attlee and concurred in by Generalissimo Chiang Kai-shek became the basis of the Japanese surrender in Tokyo bay on Sept. 2, 1945. (E. W. Sc.)

Following is the report of the conference which was signed by the three government heads.

#### REPORT ON THE TRIPARTITE CONFERENCE OF BERLIN

On July 17, 1945, the President of the United States of America, Harry S. Truman, the Chairman of the Council of People's Commissars of the Union of Soviet Socialist Republics, Generalissimo J. V. Stalin, and the Prime Minister of Great Britain, Winston S. Churchill, together with Mr. Clement R. Attlee, met in the Tripartite Conference of Berlin.

PREMIER STALIN, President Truman and Prime Minister Churchill pose informally before the opening session of the Berlin conference in the suburb of Potsdam, July 17, 1945. Churchill was succeeded at Potsdam by Clement R. Attlee on July 28, following the general election in Great Britain

They were accompanied by the foreign secretaries of the three governments, Mr. James F. Byrnes, Mr. V. M. Molotov, and Mr. Anthony Eden, the Chiefs of Staff, and other advisers.

There were nine meetings between July seventeenth and July twenty-fifth. The conference was then interrupted for two days while the results of the British general election were being declared.

On July twenty-eighth Mr. Attlee returned to the conference as Prime Minister, accompanied by the new Secretary of State for Foreign Affairs, Mr. Ernest Bevin. Four days of further discussion then took place. During the course of the conference there were regular meetings of the heads of the three governments accompanied by the foreign secretaries, and also of the foreign secretaries alone. Committees appointed by the foreign secretaries for preliminary consideration of questions before the conference also met daily.

The meetings of the conference were held at the Cecilienhof near Potsdam. The conference ended on August 2, 1945.

Important decisions and agreements were reached. Views were exchanged on a number of other questions and consideration of these matters will be continued by the Council of Foreign Ministers established by the conference.

President Truman, Generalissimo Stalin and Prime Minister Attlee leave this conference, which has strengthened the ties between the three governments and extended the scope of their collaboration and understanding, with renewed confidence that their governments and peoples, together with the other United Nations, will ensure the creation of a just and enduring peace.

#### II

##### ESTABLISHMENT OF A COUNCIL OF FOREIGN MINISTERS

The conference reached an agreement for the establishment of a Council of Foreign Ministers representing the five principal powers to continue the necessary preparatory work for the peace settlements and to take up other matters which from time to time may be referred to the Council by agreement of the governments participating in the Council.

The text of the agreement for the establishment of the Council of Foreign Ministers is as follows:

1. There shall be established a Council composed of the foreign ministers of the United Kingdom, the Union of Soviet Socialist Republics, China, France and the United States.

2.(i) The Council shall normally meet in London, which shall be the permanent seat of the joint secretariat which the Council will form. Each of the foreign ministers will be accompanied by a high-ranking deputy, duly authorized to carry on the work of the Council in the absence of his foreign minister, and by a small staff of technical advisers.

(ii) The first meeting of the Council shall be held in London not later than September 1, 1945. Meetings may be held by common agreement in other capitals as may be agreed from time to time.

3.(i) As its immediate important task, the Council shall be authorized to draw up, with a view to their submission to the United Nations, treaties of peace with Italy, Rumania, Bulgaria, Hungary and Finland, and to propose settlements of territorial questions outstanding on the termination of the war in Europe. The Council shall be utilized for the preparation of a peace settlement for Germany to be accepted by the government of Germany when a government adequate for the purpose is established.

(ii) For the discharge of each of these tasks the Council will be composed of the members representing those states which were signatory to the terms of surrender imposed upon the enemy state concerned. For the purpose of the peace settlement for Italy, France shall be regarded as a signatory to the terms of surrender for Italy. Other members will be invited to participate when matters directly concerning them are under discussion.

(iii) Other matters may from time to time be referred to the Council by agreement between the member governments.

4.(i) Whenever the Council is considering a question of direct interest to a state not represented thereon, such state should be invited to send representatives to participate in the discussion and study of that question.

(ii) The Council may adapt its procedure to the particular problem under consideration. In some cases it may hold its own preliminary discussions prior to the participation of other interested states. In other cases, the Council may convoke a formal conference of the state chiefly interested in seeking a solution of the particular problem.

In accordance with the decision of the conference the three governments have each addressed an identical invitation to the governments of China and France to adopt this text and to join in establishing the Council.

The establishment of the Council of Foreign Ministers for the specific purposes named in the text will be without prejudice to the agreement of the Crimea Conference that there should be periodic consultation among the foreign secretaries of the United States, the Union of Soviet Socialist Republics and the United Kingdom.

The conference also considered the position of the European Advisory Commission in the light of the agreement to establish the Council of Foreign Ministers. It was noted with satisfaction that the Commission had ably discharged its principal tasks by the recommendations that it had furnished for the terms of Germany's unconditional surrender, for the zones of occupation in Germany and Austria, and for the inter-Allied control machinery in those countries. It was felt that further work of a detailed character for the coordination of allied policy for the control of Germany and Austria would in future fall within the competence of the Allied Control Council at Berlin and the Allied Commission at Vienna. Accordingly, it was agreed to recommend that the European Advisory Commission be dissolved.

#### III

##### GERMANY

The Allied Armies are in occupation of the whole of Germany and the German people have begun to atone for the terrible crimes committed under the leadership of those whom in the hour of their success, they openly approved and blindly obeyed.

Agreement has been reached at this conference on the political and economic principles of a coordinated Allied policy toward defeated Germany during the period of Allied control.

THE BERLIN CONFERENCE was resumed on July 28, 1945, after the British elections were announced. Prime Minister Attlee is at far side of table, centre; Marshal Stalin stands at right; President Truman is seen in profile, left foreground

The purpose of this agreement is to carry out the Crimea Declaration on Germany. German militarism and Nazism will be extirpated and the Allies will take in agreement together, now and in the future, the other measures necessary to assure that Germany never again will threaten her neighbors or the peace of the world.

It is not the intention of the Allies to destroy or enslave the German people. It is the intention of the Allies that the German people be given the opportunity to prepare for the eventual reconstruction of their life on a democratic and peaceful basis. If their own efforts are steadily directed to this end, it will be possible for them in due course to take their place among the free and peaceful peoples of the world.

The text of the agreement is as follows:

#### The Political and Economic Principles to Govern the Treatment of Germany in the Initial Control Period

##### A. Political Principles.

1. In accordance with the agreement on control machinery in Germany, supreme authority in Germany is exercised on instructions from their respective governments, by the Commanders-in-Chief of the armed forces of the United States of America, the United Kingdom, the Union of Soviet Socialist Republics, and the French Republic, each in his own zone of occupation, and also jointly, in matters affecting Germany as a whole, in their capacity as members of the Control Council.

2. So far as is practicable, there shall be uniformity of treatment of the German population throughout Germany.

3. The purposes of the occupation of Germany by which the Control Council shall be guided are:

(i) The complete disarmament and demilitarization of Germany and the elimination or control of all German industry that could be used for military production. To these ends:

(a) All German land, naval and air forces, the S.S., S.A., S.D., and Gestapo, with all their organizations, staffs and institutions, including the General Staff, the Officers' Corps, Reserve Corps, military schools, war veterans' organizations and all other military and quasi-military organizations, together with all clubs and associations which serve to keep alive the military tradition in Germany, shall be completely and finally abolished in such manner as permanently to prevent the revival or reorganization of German militarism and Nazism.

(b) All arms, ammunition and implements of war and all specialized facilities for their production shall be held at the disposal of the Allies or destroyed. The maintenance and production of all aircraft and all arms, ammunition and implements of war shall be prevented.

(ii) To convince the German people that they have suffered a total military defeat and that they cannot escape responsibility for what they have brought upon themselves, since their own ruthless warfare and the fanatical Nazi resistance have destroyed German economy and made chaos and suffering inevitable.

(iii) To destroy the National Socialist Party and its affiliated and supervised organizations, to dissolve all Nazi institutions, to ensure that they are not revived in any form, and to prevent all Nazi and militarist activity or propaganda.

(iv) To prepare for the eventual reconstruction of German political life on a democratic basis and for eventual peaceful cooperation in international life by Germany.

4. All Nazi laws which provided the basis of the Hitler regime or established discrimination on grounds of race, creed, or political opinion shall be abolished. No such discriminations, whether legal, administrative or otherwise, shall be tolerated.

5. War criminals and those who have participated in planning or carrying out Nazi enterprises involving or resulting in atrocities or war crimes shall be arrested and brought to judgment. Nazi leaders, influential Nazi supporters and high officials of Nazi organizations and institutions and any other persons dangerous to the occupation or its objectives shall be arrested and interned.

6. All members of the Nazi party who have been more than nominal participants in its activities and all other persons hostile to allied purposes shall be removed from public and semi-public office, and from positions of responsibility in important private undertakings. Such persons shall be replaced by persons who, by their political and moral qualities, are deemed capable of assisting in developing genuine democratic institutions in Germany.

7. German education shall be so controlled as completely to eliminate Nazi and militarist doctrines and to make possible the successful development of democratic ideas.

8. The judicial system will be reorganized in accordance with the principles of democracy, of justice under law, and of equal rights for all citizens without distinction of race, nationality or religion.

9. The administration of affairs in Germany should be directed towards the decentralization of the political structure and the development of local responsibility. To this end:

(i) Local self-government shall be restored throughout Germany on democratic principles and in particular through elective councils as rapidly as is consistent with military security and the purposes of military occupation;

(ii) All democratic political parties with rights of assembly and of public discussion shall be allowed and encouraged throughout Germany;

(iii) Representative and elective principles shall be introduced into regional, provincial and state (land) administration as rapidly as may be justified by the successful application of these principles in local

"BABY FOOD." Plaschke of the *Chicago Herald-American* was critical of the guarded news releases coming from the Berlin Conference in July 1945

self-government;

(iv) For the time being no central German government shall be established. Notwithstanding this, however, certain essential central German administrative departments, headed by state secretaries, shall be established, particularly in the fields of finance, transport, communications, foreign trade and industry. Such departments will act under the direction of the Control Council.

10. Subject to the necessity for maintaining military security, freedom of speech, press and religion shall be permitted, and religious institutions shall be respected. Subject likewise to the maintenance of military security, the formation of free trade unions shall be permitted.

#### B. Economic Principles.

11. In order to eliminate Germany's war potential, the production of arms, ammunition and implements of war as well as all types of aircraft and sea-going ships shall be prohibited and prevented. Production of metals, chemicals, machinery and other items that are directly necessary to a war economy shall be rigidly controlled and restricted to Germany's approved post-war peacetime needs to meet the objectives stated in paragraph 15. Productive capacity not needed for permitted production shall be removed in accordance with the reparations plan recommended by the Allied Commission on reparations and approved by the governments concerned or if not removed shall be destroyed.

12. At the earliest practicable date, the German economy shall be decentralized for the purpose of eliminating the present excessive concentration of economic power as exemplified in particular by cartels, syndicates, trusts and other monopolistic arrangements.

13. In organizing the German economy, primary emphasis shall be given to the development of agriculture and peaceful domestic industries.

14. During the period of occupation Germany shall be treated as a single economic unit. To this end common policies shall be established in regard to:

- (a) Mining and industrial production and allocations;
- (b) Agriculture, forestry and fishing;
- (c) Wages, prices and rationing;
- (d) Import and export programs for Germany as a whole;
- (e) Currency and banking, central taxation and customs;
- (f) Reparation and removal of industrial war potential;
- (g) Transportation and communications.

In applying these policies account shall be taken, where appropriate, of varying local conditions.

15. Allied controls shall be imposed upon the German economy but only to the extent necessary:

- (a) To carry out programs of industrial disarmament and demilitarization, of reparations, and of approved exports and imports.
- (b) To assure the production and maintenance of goods and services required to meet the needs of the occupying forces and displaced persons in Germany and essential to maintain in Germany average living standards not exceeding the average of the standards of living of European countries. (European countries means all European countries excluding the United Kingdom and the Union of Soviet Socialist Republics.)
- (c) To ensure in the manner determined by the Control Council the equitable distribution of essential commodities between the several zones so as to produce a balanced economy throughout Germany and reduce the need for imports.
- (d) To control German industry and all economic and financial international transactions, including exports and imports, with the aim of preventing Germany from developing a war potential and of achieving the other objectives named herein.
- (e) To control all German public or private scientific bodies, research

and experimental institutions, laboratories, et cetera, connected with economic activities.

16. In the imposition and maintenance of economic controls established by the Control Council, German administrative machinery shall be created and the German authorities shall be required to the fullest extent practicable to proclaim and assume administration of such controls. Thus it should be brought home to the German people that the responsibility for the administration of such controls and any breakdown in these controls will rest with themselves. Any German controls which may run counter to the objectives of occupation will be prohibited.

17. Measures shall be promptly taken:

- (a) To effect essential repair of transport;
- (b) To enlarge coal production;
- (c) To maximize agricultural output; and
- (d) To effect emergency repair of housing and essential utilities.

18. Appropriate steps shall be taken by the Control Council to exercise control and the power of disposition over German-owned external assets not already under the control of United Nations which have taken part in the war against Germany.

19. Payment of reparations should leave enough resources to enable the German people to subsist without external assistance. In working out the economic balance of Germany the necessary means must be provided to pay for imports approved by the Control Council in Germany. The proceeds of exports from current production and stocks shall be available in the first place for payment for such imports.

The above clause will not apply to the equipment and products referred to in paragraphs 4(A) and 4(B) of the Reparations Agreement.

#### IV

##### REPARATIONS FROM GERMANY

In accordance with the Crimea decision that Germany be compelled to compensate to the greatest possible extent for the loss and suffering that she has caused to the United Nations and for which the German people cannot escape responsibility, the following agreement on reparations was reached:

1. Reparation claims of the U.S.S.R. shall be met by removals from the zone of Germany occupied by the U.S.S.R. and from appropriate German external assets.

2. The U.S.S.R. undertakes to settle the reparation claims of Poland from its own share of reparations.

3. The reparation claims of the United States, the United Kingdom and other countries entitled to reparations shall be met from the western zones and from appropriate German external assets.

4. In addition to the reparations to be taken by the U.S.S.R. from its own zone of occupation, the U.S.S.R. shall receive additionally from the western zones:

(A) 15 per cent of such usable and complete industrial capital equipment, in the first place from the metallurgical, chemical and machine manufacturing industries, as is unnecessary for the German peace economy and should be removed from the western zones of Germany, in exchange for an equivalent value of food, coal, potash, zinc, timber, clay products, petroleum products, and such other commodities as may be agreed upon.

(B) 10 per cent of such industrial capital equipment as is unnecessary for the German peace economy and should be removed from the western zones, to be transferred to the Soviet Government on reparations account without payment or exchange of any kind in return.

Removals of equipment as provided in (A) and (B) above shall be made simultaneously.

5. The amount of equipment to be removed from the western zones on account of reparations must be determined within six months from now at the latest.

6. Removals of industrial capital equipment shall begin as soon as possible and shall be completed within two years from the determination specified in paragraph 5. The delivery of products covered by 4(A) above shall begin as soon as possible and shall be made by the U.S.S.R. in agreed installments within five years of the date hereof. The determination of the amount and character of the industrial capital equipment unnecessary for the German peace economy and therefore available for reparations shall be made by the control council under policies fixed by the Allied Commission on Reparations, with the participation of France, subject to the final approval of the zone commander in the zone from which the equipment is to be removed.

7. Prior to the fixing of the total amount of equipment subject to removal, advance deliveries shall be made in respect of such equipment as will be determined to be eligible for delivery in accordance with the procedure set forth in the last sentence of paragraph 6.

8. The Soviet Government renounces all claims in respect of reparations to shares of German enterprises which are located in the western zones of occupation in Germany as well as to German foreign assets in all countries except those specified in paragraph 9 below.

9. The Governments of the United Kingdom and the United States of America renounce their claims in respect of reparations to shares of German enterprises which are located in the eastern zone of occupation in Germany, as well as to German foreign assets in Bulgaria, Finland, Hungary, Rumania and Eastern Austria.

10. The Soviet Government makes no claims to gold captured by the Allied troops in Germany.

#### V

##### DISPOSAL OF THE GERMAN NAVY AND MERCHANT MARINE

The conference agreed in principle upon arrangements for the use and disposal of the surrendered German fleet and merchant ships. It was decided that the three governments would appoint experts to work out together detailed plans to give effect to the agreed principles. A further joint statement will be published simultaneously by the three governments in due course.

#### VI

##### CITY OF KOENIGSBERG AND THE ADJACENT AREA

The conference examined a proposal by the Soviet Government that pending the final determination of territorial questions at the peace settle-

ment the section of the western frontier of the Union of Soviet Socialist Republics which is adjacent to the Baltic Sea should pass from a point on the eastern shore of the Bay of Danzig to the east, north of Braunsberg-Goldap, to the meeting point of the frontiers of Lithuania, the Polish Republic and East Prussia.

The conference has agreed in principle to the proposal of the Soviet Government concerning the ultimate transfer to the Soviet Union of the City of Königsberg and the area adjacent to it as described above subject to expert examination of the actual frontier.

The President of the United States and the British Prime Minister have declared that they will support the proposal of the conference at the forthcoming peace settlement.

## VII

## WAR CRIMINALS

The three governments have taken note of the discussions which have been proceeding in recent weeks in London between British, United States, Soviet and French representatives with a view to reaching agreement on the methods of trial of those major war criminals whose crimes under the Moscow Declaration of October 1943 have no particular geographical localization. The three governments reaffirm their intention to bring those criminals to swift and sure justice. They hope that the negotiations in London will result in speedy agreement being reached for this purpose, and they regard it as a matter of great importance that the trial of those major criminals should begin at the earliest possible date. The first list of defendants will be published before September first.

## VIII

## AUSTRIA

The conference examined a proposal by the Soviet Government on the extension of the authority of the Austrian Provisional Government to all of Austria.

The three governments agreed that they were prepared to examine this question after the entry of the British and American forces into the City of Vienna.

## IX

## POLAND

The conference considered questions relating to the Polish Provisional Government and the western boundary of Poland.

On the Polish Provisional Government of National Unity they defined their attitude in the following statement:

A—We have taken note with pleasure of the agreement reached among representative Poles from Poland and abroad which has made possible the formation, in accordance with the decisions reached at the Crimea Conference, of a Polish Provisional Government of National Unity recognized by the three powers. The establishment by the British and United States Governments of diplomatic relations with the Polish Provisional Government has resulted in the withdrawal of their recognition from the former Polish Government in London, which no longer exists.

The British and United States Governments have taken measures to protect the interest of the Polish Provisional Government as the recognized government of the Polish State in the property belonging to the Polish State located in their territories and under their control, whatever the form of this property may be. They have further taken measures to prevent alienation to third parties of such property. All proper facilities will be given to the Polish Provisional Government for the exercise of the ordinary legal remedies for the recovery of any property belonging to the Polish State which may have been wrongfully alienated.

The three powers are anxious to assist the Polish Provisional Government in facilitating the return to Poland as soon as practicable of all Poles abroad who wish to go, including members of the Polish armed forces and the Merchant Marine. They expect that those Poles who return home shall be accorded personal and property rights on the same basis as all Polish citizens.

The three powers note that the Polish Provisional Government in accordance with the decisions of the Crimea Conference has agreed to the holding of free and unfettered elections as soon as possible on the basis of universal suffrage and secret ballot in which all democratic and anti-Nazi parties shall have the right to take part and to put forward candidates, and that representatives of the Allied press shall enjoy full freedom to report to the world upon developments in Poland before and during the elections.

B—The following agreement was reached on the western frontier of Poland:

In conformity with the agreement on Poland reached at the Crimea Conference the three heads of government have sought the opinion of the Polish Provisional Government of National Unity in regard to the accession of territory in the north and west which Poland should receive. The President of the National Council of Poland and members of the Polish Provisional Government of National Unity have been received at the conference and have fully presented their views. The three heads of government reaffirm their opinion that the final delimitation of the western frontier of Poland should await the peace settlement.

The three heads of government agree that, pending the final determination of Poland's western frontier, the former German territories east of a line running from the Baltic Sea immediately west of Swinemünde, and thence along the Oder River to the confluence of the western Neisse River and along the western Neisse to the Czechoslovak frontier, including that portion of East Prussia not placed under the administration of the Union of Soviet Socialist Republics in accordance with the understanding reached at this conference and including the area of the former free City of Danzig, shall be under the administration of the Polish State and for such purposes should not be considered as part of the Soviet zone of occupation in Germany.

## X

## CONCLUSION OF PEACE TREATIES AND ADMISSION TO THE UNITED NATIONS ORGANIZATION

The conference agreed upon the following statement of common policy for establishing, as soon as possible, the conditions of lasting peace after victory in Europe:

The three governments consider it desirable that the present anomalous position of Italy, Bulgaria, Finland, Hungary and Rumania should be terminated by the conclusion of peace treaties. They trust that the other interested Allied governments will share these views.

For their part the three governments have included the preparation of a peace treaty for Italy as the first among the immediate important tasks to be undertaken by the new Council of Foreign Ministers. Italy was the first of the Axis powers to break with Germany, to whose defeat she has made a material contribution, and has now joined with the Allies in the struggle against Japan. Italy has freed herself from the Fascist regime and is making good progress towards the re-establishment of a democratic government and institutions. The conclusion of such a peace treaty with a recognized and democratic Italian government will make it possible for the three governments to fulfill their desire to support an application from Italy for membership of the United Nations.

The three governments have also charged the Council of Foreign Ministers with the task of preparing peace treaties for Bulgaria, Finland, Hungary and Rumania. The conclusion of peace treaties with recognized democratic governments in these states will also enable the three governments to support applications from them for membership of the United Nations. The three governments agree to examine each separately in the near future, in the light of the conditions then prevailing, the establishment of diplomatic relations with Finland, Rumania, Bulgaria, and Hungary to the extent possible prior to the conclusion of peace treaties with those countries.

The three governments have no doubt that in view of the changed conditions resulting from the termination of the war in Europe, representatives of the Allied press will enjoy full freedom to report to the world upon developments in Rumania, Bulgaria, Hungary and Finland.

As regards the admission of other states into the United Nations Organization, Article 4 of the Charter of the United Nations declares that:

"1. Membership in the United Nations is open to all other peace-loving states who accept the obligations contained in the present Charter and, in the judgment of the Organization, are able and willing to carry out these obligations;

"2. The admission of any such state to membership in the United Nations will be effected by a decision of the General Assembly upon the recommendation of the Security Council."

The three governments, so far as they are concerned, will support applications for membership from those states which have remained neutral during the war and which fulfill the qualifications set out above.

The three governments feel bound however to make it clear that they for their part would not favor any application for membership put forward by the present Spanish Government, which, having been founded with the support of the Axis powers, does not, in view of its origins, its nature, its record and its close association with the aggressor states, possess the qualifications necessary to justify such membership.

## XI

## TERRITORIAL TRUSTEESHIPS

The conference examined a proposal by the Soviet Government concerning trusteeship territories as defined in the decision of the Crimea Conference and in the Charter of the United Nations Organization.

After an exchange of views on this question it was decided that the disposition of any former Italian territories was one to be decided in connection with the preparation of a peace treaty for Italy and that the question of Italian territory would be considered by the September Council of Ministers of Foreign Affairs.

## XII

## REVISED ALLIED CONTROL COMMISSION PROCEDURE IN RUMANIA, BULGARIA, AND HUNGARY

The three governments took note that the Soviet representatives on the Allied Control Commissions in Rumania, Bulgaria and Hungary, have communicated to their United Kingdom and United States colleagues proposals for improving the work of the Control Commission, now that hostilities in Europe have ceased.

The three governments agreed that the revision of the procedures of the Allied Control Commissions in these countries would now be undertaken, taking into account the interests and responsibilities of the three governments which together presented the terms of armistice to the respective countries, and accepting as a basis the agreed proposals.

## XIII

## ORDERLY TRANSFERS OF GERMAN POPULATIONS

The conference reached the following agreement on the removal of Germans from Poland, Czechoslovakia and Hungary:

The three governments having considered the question in all its aspects, recognize that the transfer to Germany of German populations, or elements thereof, remaining in Poland, Czechoslovakia and Hungary, will have to be undertaken. They agree that any transfers that take place should be effected in an orderly and humane manner.

Since the influx of a large number of Germans into Germany would increase the burden already resting on the occupying authorities, they consider that the Allied Control Council in Germany should in the first instance examine the problem with special regard to the question of the equitable distribution of these Germans among the several zones of occupation. They are accordingly instructing their respective representatives on the Control Council to report to their governments as soon as possible the extent to which such persons have already entered Germany from Poland, Czechoslovakia and Hungary, and to submit an estimate

of the time and rate at which further transfers could be carried out, having regard to the present situation in Germany.

The Czechoslovak Government, the Polish Provisional Government and the Control Council in Hungary are at the same time being informed of the above, and are being requested meanwhile to suspend further expulsions pending the examination by the governments concerned of the report from their representatives on the Control Council.

## XIV

## MILITARY TALKS

During the conference there were meetings between the Chiefs of Staff of the three governments on military matters of common interest.

Approved:

J. V. STALIN  
HARRY S. TRUMAN  
C. R. ATTLEE

**Bermuda.** An archipelago of about 360 small islands approximately 580 mi. east of North Carolina. Area: 19.3 sq.mi.; pop. (est., 1944): 33,925. The capital is Hamilton, pop. (1939), 1,863. The only other town of importance is St. George, pop. (1939), 2,665. The islands are organized politically as a British crown colony. The governor in the early part of 1945 was Lt. Col. Lord Burghley (appointed Aug. 24, 1943), but he announced his resignation Aug. 9; no successor was appointed and at the end of the year William Addis was acting governor. Bermuda has a representative government, including an executive council of seven and a legislative council of nine, both appointed by the crown, and an elective assembly.

**History.**—The perennial question of woman suffrage came to a climax in the defeat on Feb. 17, 1945, of a motion offered in the assembly by Dr. A. E. Cann, a Negro, providing for universal suffrage. The woman suffrage society was subsequently dissolved, April 11. British authorities on June 26 appointed William Addis colonial secretary. The United States on Aug. 6 returned the small Ordnance Island to St. George municipal authorities but United States naval officials on Sept. 6 urged retention by the United States of its naval base in the islands, the site for which was obtained from Great Britain in 1940. U.S. Representative Michael Bradley at the same time proposed British cession of the island base to the United States in part cancellation of lend-lease aid. Bermudian officials simultaneously proposed commercial use of Kindley airfield, operated by the U.S. army, but negotiations to that end encountered considerable delays. Canada had virtually closed its naval training base (commissioned Aug. 1, 1944) by Aug. 27 and announced its closing on Sept. 17. The United States and Bermuda mutually removed passport and visa restrictions, imposed during World War II, on Sept. 6. The United States and the British commonwealth opened a telecommunications conference at Hamilton Sept. 22; agreement on maximum rates for telecommunications facilities was announced Nov. 29.

**Finance.**—The monetary unit is the pound sterling, linked to the pound in London and in other British West Indian possessions, and valued in 1945 at \$4.06 for buying and \$4.00 for selling. Inflation continued to be a major economic problem in 1945. The colonial debt in 1943 was £275,000, including a non-interest bearing loan of £200,000 made to the British government for war purposes.

**Production.**—Most Bermudian production is agricultural, manufacturing and mining being practically nonexistent. The chief agricultural items are lily bulbs, green vegetables, potatoes and bananas. Cedar is the only wood available. Farm products were valued in 1943 at £440,000, the highest figure on record. Important amounts of lobsters and fish are normally obtained.

**Trade and Communications.**—Principal items of export are green vegetables, lily bulbs and potatoes. Bulb shipments in 1943 were 700,000 (1942, 755,000). Chief destinations of exports are Canada and the United States. Leading items of import are foodstuffs, clothing and textiles, hardware and furniture; the chief suppliers are the United States, Canada and the

United Kingdom. The first shipment of meat to reach Bermuda through commercial channels after 1942 arrived Sept. 3, 1945. With the end of the war, all shipping controls on cargoes from the United States and Canada were declared lifted on Aug. 30. Imports of fuel in 1944 were valued at £130,152; imports of sawed lumber in the same year amounted to 1,100,130 board feet and were valued at \$100,000 (U.S.).

The colony has only 21.5 mi. of railroad and 120 mi. of highway. Considerable work in construction of utility highways in connection with naval base development was undertaken in 1944-45, however. Railway passengers in 1943 totalled 1,487,477 and ferry passengers in the same year, 772,294. Estimates for expenditures for road repair and maintenance for 1945 were £49,500 as against £31,600 for 1944; an expenditure of £24,772 was authorized for 1945 for road building equipment. With the end of the war, Bermudian officials began making plans for an early and large-scale revival of the tourist trade, virtually suspended earlier by wartime restrictions because of naval base construction.

**BIBLIOGRAPHY.**—David Garth, *Bermuda Calling* (1944). (R. H. FN.)

**Beryllium.** There was a decline in the demand for beryllium in 1944, with consumption dropping by one-quarter. The U.S. output during the war years, released for publication in 1945, was 95 short tons in 1939, 121 tons in 1940, 158 tons in 1941, 269 tons in 1942, 356 tons in 1943 and 388 tons in 1944. Of the six-year total of 1,387 tons, 1,058 tons came from South Dakota. Late in 1944 a single crystal of beryl 28 ft. long and weighing more than 61 tons was found in the Ingersoll mine, near Custer, S.D. The bulk of the supply was from imports, mainly from Brazil, Argentina, India and Australia, totalling 810 tons in 1940, 2,666 tons in 1941, 2,050 tons in 1942, 4,840 tons in 1943 and 3,115 tons in 1944. The U.S. imports absorbed about three-quarters of the world output.

(G. A. Ro.)

**Berzarin, Nikolai Y.** (1904?-1945), Russian army officer, son of a Leningrad worker, joined the Red army at 14 years of age. He participated in the Murmansk fighting, 1918-19, and was sent to an officers' training centre in 1922. The following year, he was transferred to the far east. He remained there long enough to help organize the Pacific coast defenses against the Japanese when World War II threatened. He later returned to the European theatre of war and on June 3, 1945, took over the post of Russian military commander of Berlin. At that time, he declared that he would help to restore the fallen reich capital to normalcy by "helping the Germans to help themselves," and that he would follow a policy of "no pampering but no cruelty." Shortly after he assumed his new post and rumours were still rampant as to Adolf Hitler's whereabouts, he stated that it was his personal conviction that Hitler was hiding somewhere in Europe—probably Spain. Col. Gen. Berzarin's death as a result of a motorcycle accident was reported by the soviet-controlled Berlin radio, June 18.

**Bevin, Ernest** (1881- ), British labour leader and cabinet minister, was born in Winsford, Somerset, England, the son of an agricultural labourer. In his youth he was a truck driver in the vicinity of Bristol; later he was elected general secretary of the Transport and General Workers' union, which became one of the largest trade unions in the world. Bevin played a leading part in the general strike of 1926,

which was broken by Winston Churchill. In 1937 he was appointed chairman of the General Council of Trades Union congress. One of the first to recognize the danger of Hitlerism, Bevin spoke out on May day, 1940, against Neville Chamberlain's appeasement policy. A fortnight later Churchill named him minister of labour and national service, and on Oct. 3, 1940, Bevin was promoted to the war cabinet. He speeded up munitions production, kept strikes, work stoppages and lockouts to a minimum and worked smoothly with Churchill. After the Labourite victory at the polls, July 26, 1945, Bevin was appointed foreign secretary by Prime Minister Attlee (July 27). He then superseded Anthony Eden at the Berlin conference. Bevin was one of the major participants in the London conference of foreign ministers in the fall of 1945 and declared (Oct. 9) that failure of this parley was due to Molotov's insistence that the smaller powers be excluded from the drafting of the peace treaties. In a speech to commons, Nov. 7, he said that the United States and Great Britain should retain the secret of the atomic bomb for the time being. He announced (Nov. 13) the establishment of a joint U.S.-British committee of inquiry to investigate the Palestine situation. In a commons speech, Nov. 23, he defended postponement of the Greek plebiscite and the use of British troops in Java and obliquely criticized the soviet policy in Iran. Bevin attended the conference of foreign ministers in Moscow. Unlike its predecessor, the London conference, this parley was successful and the conferees—Bevin, Byrnes and Molotov—reached agreement, Dec. 27, on many controversial and outstanding issues.

**BEW:** see FOREIGN ECONOMIC ADMINISTRATION.

**Bibesco, Princess Elizabeth** (1897-1945), British author, was the daughter of the 1st earl of Oxford and Asquith, former British prime minister, and his second wife, Margaret Tennant (Margot), the noted wit and author. She was married to Prince Antoine Bibesco in 1919 when he was councillor of the Rumanian legation in London and accompanied her husband to Washington, D.C., where he served as minister, 1920-26. The princess followed in her mother's footsteps, and her first book, a collection of short stories, was well received in the U.S. In Washington the princess caused a minor furore during the presidential election of 1924 by urging the election of John W. Davis, the Democratic nominee, in a letter to a nationally known liberal magazine. This disregard of the rules of diplomatic protocol nearly caused an international incident and jeopardized, momentarily, her husband's position. The princess, considered a skilled author of short stories, wrote the following works: *I Have Only Myself to Blame* (1921); *Balloons* (1923); *The Fir and the Palm* (1924); *The Painted Swan* and *The Whole Story* (1925); *There Is No Return* (1927); *Portrait of Caroline* (1931) and *The Romantic* (1940). Her death on April 7 was reported from Bucharest.

**Biddle, Francis** (1886- ), U.S. attorney and cabinet member, was born May 9 in Paris, France, but was brought to the U.S. in infancy. He was educated at Haverford (Pa.) and Groton (Mass.) schools and Harvard university, Cambridge, Mass., and was admitted to the bar in Pennsylvania in 1912. He was special assistant U.S. attorney for the eastern district of Pennsylvania from 1922 to 1926. Biddle was solicitor general in 1940-41, and later in 1941 was appointed to Pres. Franklin D. Roosevelt's cabinet as attorney general. In June 1944 he defended the seizure of the Mont-

gomery Ward plant in Chicago as a move in the public interest. In his annual report, March 18, 1945, Biddle urged congress to enact new sabotage legislation to include conspiracy and to make aid to escaped prisoners of war a treasonable offense. He also asked for alterations in the naturalization statutes to ease citizenship requirements and new laws to expedite prosecutions of war frauds in manufacturing. He resigned May 23 and was replaced by Thomas C. Clark as attorney general. President Truman appointed Biddle, Sept. 12, as the U.S. judge on the international tribunal that tried the German war criminals at Nuernberg.

**"Big Inch" Line:** see PETROLEUM.

**Billiards.** Welker Cochran, graying San Francisco veteran, successfully defended the three-cushion billiard championship of the world in 1945. To accomplish this, Cochran outlasted Willie Hoppe of New York in a cross-country tour. After 90 games had been contested, Cochran finished with an aggregate of 4,819 points, as compared with the 4,771 tallied by Hoppe, himself a former titleholder.

This represented the only major competition in billiards for the year. However, Cochran, Hoppe and Charles Peterson, the trick-shot artist, kept themselves busy, visiting service camps and entertaining the G.I.'s.

The 29th annual national amateur three-cushion crown was won by Edward Lee of the New York A. C. In a ten-day round-robin, Lee swept through all seven of his matches, taking the measure of C. C. Vandover, the defending champion, 50-38, in the last match.

There was no pocket billiard tournament, so that Willie Mosconi of Toledo, O., continued his reign at the top.

(L. EF.)

**Biochemistry.** **Vitamins, Essential Amino Acids.**—That tryptophane is essential for niacin formation was indicated by the observation that niacin deficiency in rats and chicks can be prevented by feeding tryptophane. This niacin deficiency is brought on by diets of which the proteins are deficient in tryptophane, like corn or gelatin, but not by diets containing an adequate amount of casein.

Methods for the differential determination of pyridoxin, pyridoxamine and pyridoxal were developed in terms of their selective effect on the growth of various microorganisms, and in terms of their selective destruction by chemical reagents. Pyridoxamine and pyridoxal constitute a considerable part (in active tissues like liver and yeast the greater part) of the vitamin B<sub>6</sub> content. Pyridoxal phosphate was shown to be the coenzyme of decarboxylases of arginine and glutamic acid as well as of the previously reported tyrosine and lysine decarboxylases. A new chemical function was found for pyridoxal phosphate, that of a coenzyme for transaminases. This function was suggested by the observation that tissues of B<sub>6</sub>-deficient rats have low transaminase activity, and that pyridoxal and pyridoxamine are interconvertible by heating with amino and keto acids respectively. This function was proved by preparation of the transaminase apoenzyme, and the observation of its activation by synthetic pyridoxal phosphate. This gives the B<sub>6</sub> group of vitamins a fundamental role in protein metabolism.

Many studies were reported on structural analogues of vitamins some of which are vitamers, physiological substitutes for vitamins; others are antivitamins, that is, they cause vitamin deficiencies. New examples in the latter group are the production of niacin deficiency in mice by 3-acetylpyridine; pantothenic acid deficiency in various microorganisms by several new analogues of pantothenic acid; vitamin E deficiency by  $\alpha$ -tocopherol

quinone, riboflavin deficiency by galactoflavin and thiamin deficiency by the 2-*n*-butyl-pyrimidine homologue of thiamin. The inhibition of growth of certain bacteria by certain unnatural *d*-amino acids, and even by certain nonessential *L*-amino acids, has been described and interpreted in terms of competitive inhibition by structural analogues.

**Metabolism.**—The significance of acetate as an intermediary metabolite has been extended by studies with compounds containing isotopes, especially  $C^{13}$ . The conversion of acetate into fatty acids, aspartic, glutamic,  $\alpha$ -ketoglutaric, succinic and fumaric acids, porphyrins, and even into liver glycogen, was demonstrated. The conversion of acetate into glutamic acid by the intact rat, and the conversion of acetoacetate and acetate into  $\alpha$ -ketoglutaric, succinic and fumaric acids by kidney homogenates demonstrate the participation of acetate and acetoacetate in the citric acid cycle, and point to the idea that the final stages of carbohydrate and fat oxidation are identical, and that acetate or some closely related two-carbon metabolite furnishes the intermediate link. The incorporation of acetate carbon into liver glycogen by pathways other than  $CO_2$  fixation has extended this interrelation of carbohydrate and fat metabolism and has provided a convincing mechanism for the conversion of fatty acid into carbohydrate.

That acetate itself is not the reactive two-carbon metabolite was shown by the observation that in homogenized kidney, acetoacetate is readily converted into citrate, but acetate is not. In homogenized liver, octonate in the presence of pyruvate was observed to be readily converted into citrate, but acetoacetate does not form citrate under these conditions. Also in the conversion of octonate into acetoacetate by certain liver homogenates acetate was found *not* to be an intermediate; nor was acetaldehyde, acetyl phosphate nor any one of a large number of two- and four-carbon metabolites which were studied.

It was thought that this reactive two-carbon metabolite may be formed either from fatty acid oxidation or from pyruvate oxidation. In the presence of oxalacetate, the two-carbon metabolite condenses with oxalacetate to form citrate; in the absence of oxalacetate, the two-carbon metabolite condenses with itself to form acetoacetate. Thus the formation of acetoacetic acid from pyruvate and from fatty acid, and the anti-ketogenic action of glucose (which furnishes oxalacetate) have been reconciled.

**Enzymes.**—Continued interest was shown in the nature of the organic groups upon which the activity of certain enzymes depends. A large number of enzymes were classified according to the dependence of their activity upon the presence of an —SH group in the enzyme molecule. The great variety and wide distribution of these —SH enzymes, their activability by glutathione, and the wide distribution of glutathione in tissues has led to the assignment to glutathione of the role of continuous reactivation of the —SH enzymes which would otherwise be oxidatively inactivated. The activity of chymotrypsin was shown to depend upon a tyrosine group, but not upon primary amino, —SH, or —SS— groups. It is inactivated by oxidation reduction potentials more positive than  $E_h + 0.5$  volt.

**Penicillin.**—The chemical nature of penicillin has been described although all details of its structural formula were not defined with certainty by the close of 1945. Among the five known penicillins, all have the same double-ring system,  $C_8H_{11}O_4SN_2$ , attached to a variable R group. In dihydro-F-penicillin, R is *n*-amyl; in F, G, X and K penicillins R is pentenyl, benzyl, *p*-hydroxy-benzyl and heptyl, respectively. The  $C_8H_{11}O_4SN_2$  part contains a thiazolidine ring which shares a C and N atom with a  $\beta$ -alanine internal amide ring, with methyl, carboxyl and amino substituents. (See also PHYSIOLOGY; VITAMINS.)

**Biography:** see AMERICAN LITERATURE; ENGLISH LITERATURE.

**Biology:** see BOTANY; GENETICS; MARINE BIOLOGY; PHYSIOLOGY; ZOOLOGY.

**Birth Control.** The activities of the Planned Parenthood Federation of America, Inc. (formerly the Birth Control Federation of America), through its 347 state leagues and committees and 599 clinics, were given material support and stimulation by events of 1945, which found child spacing services either through clinics or referral systems, available in every state except Connecticut and Massachusetts. These were in 1945 the only states retaining legal barriers which prevented physicians prescribing birth control under any condition.

**Legal Decisions.**—Two pertinent decisions were handed down in 1945 by the district court of appeals in Washington, D.C. The first, a permanent injunction barring the postmaster general from interfering with the mailing of the Consumer's Union "Report on Contraceptive Material"; the second, overruling the postmaster general's mailing ban on Paul Popenoe's pamphlet, "Preparing for Marriage."

In Connecticut a bill to permit physicians to prescribe birth control for patients in poor health was killed in committee, although a Roper survey made just previous to the bill's introduction revealed that 85% of the state's adult voters were in favour of changing existing laws.

**Medical and Public Health.**—Dr. William W. Herrick, president of the New York Academy of Medicine, New York city, headed a committee of 40 of the city's distinguished physicians who presented a program on "Responsibility for the Health of Tomorrow's Family" at the federation's 24th annual dinner. Dinner speakers included Dr. R. C. Williams, assistant U.S. surgeon-general, U.S. public health service; Dr. Edward A. Schumann; and Lt. Col. Roy R. Grinker, medical executive, Army Air Force Convalescent hospital, St. Petersburg, Fla. A luncheon address by Mrs. Franklin D. Roosevelt, before a symposium of social agencies interested in postwar family health, including planned parenthood, was broadcast over a national network.

Temperature charts to assist in determining optimum fertility were made available to physicians by the federation's medical committee, to aid in the treatment of infertility. This phase of the planned parenthood program was increased with establishment of added infertility services or referral systems in various parts of the country.

From a study of 7,000,000 births, Dr. Jacob Yerushalmey, principal statistician of the U.S. public health service, published a report advocating an optimum interval between births to decrease the number of stillbirths.

**Research.**—To stimulate research in the field of human fertility, the Albert and Mary Lasker foundation made the first of its two annual awards of \$500 each to the scientist and public health official making significant contributions during the year. Awards for 1945 went to Dr. John MacLeod, department of anatomy, Cornell University Medical college, Ithaca, N.Y., for research in the motility of human sperm, and to Dr. Felix J. Underwood, director of the Mississippi state board of health for including planned parenthood in his state's public health program to improve infant and maternal health.

**Education.**—The publication of two new patient pamphlets, "Planning To Have a Baby?" and "The Soldier Takes a Wife" contributed materially to the large amount of literature requested during the year. "To Those Denied a Child" and "Population and Peace," a reprint of an address by Dr. Henry Pratt Fairchild at the University of Virginia, were also in great demand. Quantities of technical manuals and other planned parenthood literature were sent on request to physicians, educators, health officers, clergymen and social workers.

**Social Work.**—National Social Work Advisory committee was organized to give professional advice on the social work program. The Y.W.C.A. announced its resolution favouring "the principles of planned parenthood." Planned parenthood literature was included by the National Publicity council in its mailings to social agencies throughout the country, many of which ordered further literature for distribution.

**Work With Negroes.**—A second consultant on work with Negroes was added to the national staff, and several state organizations employed Negro field workers and included Negro members in their executive committees. A model clinic, the Hannah Stone Planned Parenthood centre, was established in Harlem district, New York city, to aid in reducing stillbirth, infant and maternal mortality, which is twice that of other parts of the city. Following an intensive study, the National Congress of Colored Parents and Teachers drew up a discussion outline of planned parenthood to be distributed to Negro community groups.

**Religion.**—A syllabus on marriage and family counselling was published by the federation's National Clergyman's Advisory council and made available for use in seminaries, community training schools and to individual clergymen. Army and navy chaplains made wide use of the G.I. pamphlet, "The Soldier Takes a Wife," and the library of congress translated the pamphlet into braille for blinded veterans. The Illinois league for planned parenthood added 500 ministers and rabbis to its Clergyman's Advisory committee and a number of other state organizations established similar committees.

**Press and Radio.**—Eighty articles reflecting favourable planned parenthood attitudes appeared in national popular and technical magazines during 1945. The announcement of the federation's two new pamphlets (see *Education*, above) attracted considerable newspaper comment, and wire services carried the story throughout the country. Cordial relations with many local radio stations were strengthened and both National Broadcasting company and Columbia Broadcasting system carried important annual meeting speakers. The Mutual Broadcasting system requested a speaker to discuss "The Soldier Takes a Wife" during a national news cast. The Houston (Texas) Maternal Health centre produced a 15 minute transcription which is available to all planned parenthood groups for local broadcast.

**International.**—Interest in planned parenthood showed new gains throughout the world with the ending of World War II. In England, governmental inquiries disclosed that economic and national insecurity, not the knowledge of birth control, was the determining factor in the declining birth rate. China and Japan

took official steps to adopt birth control measures to help solve their problems of overpopulation. Students of demography reported that India must include birth control in its health program if the high infant and maternal mortality was to be reduced. The western world learned of a ruling of the grand mufti of Egypt in 1937 granting legal and religious permission for the practice of birth control.

(See also BIRTH STATISTICS.)

(M. SR.)

**Birth Statistics.** The birth rate in the United States during 1945 was 2% below that for 1944, according to provisional reports covering the first nine months of both years. During 1944, the latest year of complete record, 2,794,800 births were registered, and the birth rate was 20.2 per 1,000 population. (A study based on the 1940 census showed that registration of births in the United States was then 92.5% complete.) The year 1945 is the second in which the birth rate in the U.S. declined from its wartime peak of 21.5 per 1,000 in 1943. Canada experienced a slight rise in its birth rate from 1944 to 1945, judging from reports from cities of 10,000 and over for the first nine months of both years; these show an increase of about 1% in number of births. For the entire year 1944, there were reported 283,555 births in all of Canada, the birth rate being 23.7 per 1,000 population; the rate for the year before was 24.0 per 1,000. England and Wales had a decrease in birth rate in 1945 after three successive years of increase. The indication for 1945 is provided by records for London and the great towns covering the first nine months of 1944 and 1945; these show a decrease of 4.7% in births. Births in England and Wales totalled 744,843 in 1944; the birth rate was 17.5 per 1,000 population.

A statement by the Royal Commission on Population, dated Sept. 1945, drew attention to the need for more facts for the study of population trends in Great Britain. The statement points out that births averaged 1,064,000 annually in the period 1900-09; this fell to an annual average of 701,000 during 1930-39. As a result of this downward trend, the proportion of young persons in the population is decreasing while that of old persons is increasing. It is stated that "if the average size of family were to remain as it was before the war, a time would inevitably come when there would be more deaths than births." During World War II, births in Great Britain fell to a low point in 1941, but then rose rapidly to a peak in 1944; it is suggested that the rise in the later years may be attributed to the postponement of births from the earlier years. The commission had no evidence that the decrease in the average size of family is due to increased physiological sterility. On the other hand, there was evidence that the widespread use of birth control practices was the direct cause of the decline in the birth rate. The statement was made by the commission that a continuance of the trend toward population decline would adversely affect the position of Great Britain in the world. In order to obtain the needed facts regarding family characteristics, the commission proposed that a sample census be taken of married women.

In a Canadian report on "Occupational Differences in Fertility," based upon the 1941 census (*Bulletin No. F-3*, Dominion Bureau of Statistics, 1945), it was found that in occupational groups in which the members were of like educational status, fertility tends to increase with income. As in other studies, it was observed that fertility decreases with advance in socioeconomic status (occupations were grouped into socioeconomic classes on the basis of educational level and average earnings). Except for clergymen, every occupational class had a smaller average size of family in metropolitan areas than in the country outside these areas. An earlier study on "Cultural Differences

in Family Size" (*Bulletin No. F-2*, 1945) pointed to decreases in average size of family with advance in educational status for all religious and mother tongue groups. A report on "Trends in Canadian Family Size" (*Bulletin No. F-1*, 1944) showed that early marriage influences family size by a longer reproductive period, by fewer childless marriages, and by a greater rate of issue within a given length of married life. The data also indicate a trend toward proportions of childless marriages and two-child families.

With the general decrease in the fertility of U.S. women from 1910-40, there was a narrowing in the range of the reproductive rates from one economic class to another (*Statistical Bulletin*, Metropolitan Life Insurance company, June 1945). In 1940, wives of farmers and farm managers reported 629 children under five years of age per 1,000 native white wives of ages 15 to 49; in 1910 the corresponding rate was 836 per 1,000. These figures were larger than for any other occupational group. The lowest rates in 1940 were observed among wives of (a) proprietors, managers, officials, (b) professional or semiprofessional persons and (c) clerks, where the level was about 360 per 1,000; the corresponding rates in 1910 were (a) 525; (b) 468; (c) 459. The greatest decrease from 1910-40, amounting to 30%, was found among wives of proprietors, managers and officials.

Data from the 1940 census indicate that, because of marital separations by widowhood, divorce or absence of the husband for other reasons, the birth rate in the U.S. is reduced by 6% or 7% below that observed in unbroken families (*Statistical Bulletin*, Sept. 1945). This finding is based upon the number of children under five years per 1,000 native white women of ages 15 to 49 classified according to marital status. In urban communities, this rate was 7.6% less for women who had ever married (including the widowed, divorced and separated) than for women still married and living with their first husband. In rural farm areas, this difference was only 3.3%; the smaller figure here is associated with the lesser frequency of marital separations in rural areas than in urban centres. This is a factor which may have some relation to the lower birth rates usual in cities. Considered geographically, the west showed the greatest reduction in the rate for children under five per 1,000 wives because of marital separations, namely, 8.4%; for the south, it was 6.6%, while the north eastern and north central states lost about 6%.

In 1940, the birth rates for the foreign-born and the native white population of the U.S. were practically at the same level (when adjusted for differences in the age composition of the two populations). The rate for the natives was 51 per 1,000 women of ages 10 to 54, while that for the foreign-born was 50 per 1,000 (*Statistical Bulletin*, Nov. 1944). Only two decades earlier, in 1920, the natives had a rate of 65 per 1,000, while that for the foreign-born was appreciably higher at 95 per 1,000. Of the total white births in 1940 in the birth registration states of 1915 (principally in the north east), only 5% had both parents foreign-born, 83% had both parents native born, and 12% had parents of mixed nativity (*Statistical Bulletin*, March 1945). For the same area in 1920, births among the foreign-born were 32% of the total, the natives had 55%, and 13% were to parents in both classes. The changes were attributed to the decrease in the number of foreign-born, to the fact that they are passing out of the reproductive ages, and to the more rapid decline in the birth rates among them.

The largest relative increase in number of births from 1940-43, the wartime peak year, was in families where the father was under 20 years old and the mother was of ages 20 to 24, the rise amounting to 74%. For all fathers under 20, the rise was 66%; for fathers of 20 to 24, it was 27%; at ages 25 to 29 it was 24%; at ages 30 to 39 it was 26% and at 40 to 44 it was 18%.

In 1943, of all births in the U.S., 72% were attended by a physician in a hospital, 21% by a physician elsewhere and 7% by a midwife or otherwise; the corresponding figures for 1942 are 68%, 25% and 7% respectively. (See also CENSUS DATA, 1945.)

K. Whelpton and C. V. Kiser, "Trends, Determinants, and Control in Human Fertility," *Ann. Am. Acad. Polit. and Social Science*, 237:112-122 (Jan. 1945). (A. J. Lo.)

**Bismuth.** Peru, United States, Canada and Mexico are, in order of importance, the chief producers of bismuth, accounting for 90-95% of the total output. U.S. production was not reported, but was estimated to be about 250 short tons annually. For others the 1944 outputs (with 1943 in parentheses) are as follows, in short tons: Canada 62 (204), Mexico 182 (193), Peru 459 (532); world total 1,320 (1,440). (See also METALLURGY.) (G. A. Ro.)

**Black Markets.** Black markets is a term applied generally to all transactions in violation of price and rationing regulations. In this broad sense, it covers all types of profiteering in the sale of commodities under price control and rationing violations during World War II and the postwar period of heavy demand for scarce products. In a more restrictive sense, it refers to dealings in scarce commodities by organized gangs.

The statutory basis for fixing maximum prices in the United States was established by the Emergency Price Control act in Jan. 1942 and control was extended to nearly all commodities by the issuance of the General Maximum Price regulation in March 1942. At the same time through the Second War Powers act, rationing controls were extended to such scarce products as gasoline, fuel oil, tires, new cars, sugar, coffee, processed foods, meats, fats, oils, shoes and stoves.

Black market activities ranged from purchases by housewives at overceiling prices or without ration stamps to the operations of professional criminals who counterfeited or stole gasoline and fuel-oil ration stamps and cached precious stores of tires obtained by outright theft or overceiling payments.

The first black market of any consequence was in gasoline. Organized gangs of racketeers peddled counterfeit currency or valid coupons stolen from the government to a small minority of gasoline dealers, who, in turn, sold the gasoline to consumers at prices far in excess of ceiling levels and without requiring ration stamps.

Establishment of eight OPA verification centres at which ration currency was examined to detect counterfeits and the work of a special agents' branch of investigators, specializing in the detection of persons engaged in producing or distributing counterfeit ration coupons, effectively checked the gasoline black market. Invalid coupons found by screening all gasoline coupons used were charged back against the inventory of the station turning them in, by a debiting procedure operating like a bank debit. Stations turning in large numbers of illegal coupons soon found themselves without inventory with which to continue in business.

Even more complex black market problems followed the institution of comprehensive food controls in Oct. 1942. Increasing demand and reductions of civilian supplies by that time had combined to create serious inflationary pressures and a series of black market crises followed. Particularly serious was the black market in meat, the supplies of which were at a low level. Large quantities of meat were diverted from customary distribution channels and sold in violation of controls at prices

BLACK MARKET VENDOR on the Rue du Radis, a street in Brussels, in 1945. Cigarettes sold at upwards of 90 cents per package. British and U.S. rations, from chewing gum to meat, were either displayed or stored in pockets

in excess of legal ceilings. Intensive enforcement activity resulted in the imposition of more than 1,000 sanctions and broke the black market in meat early in 1943. New outbreaks during periodic shortages in 1944 and again in the spring of 1945 were curbed. The last serious crisis during the spring of 1945 resulted in part from extensive use of counterfeit ration stamps by some dealers who were selling at overceiling prices and violating rationing regulations.

Increased demand for poultry during meat rationing and profiteering in other foods when supplies were short also created black markets in these commodities.

More recently, with the channelling of some supplies to the consumer market, extensive black market activities in textiles, apparel and used cars were uncovered and were being curtailed. There was also a recurrence of periodic black market activities in lumber and waste paper fields.

The government found that particular black markets operated by gangsters could be stamped out when sufficient manpower could be concentrated for the purpose. However, the task of investigating violators and bringing them to justice often demanded skilled effort, particularly in the food and apparel industries where market structures were intricate and diversified.

Enforcement problems were attacked from two salients. The Office of Price Administration's enforcement staff was strengthened and its activities concentrated largely at primary levels of distribution to relieve retailers of pressures that might lead them to sell at above-ceiling prices. Price panels of volunteer workers were organized throughout the country to effect compliance at retail.

During 1944 and 1945, enforcement measures were carried out by this combination of specific investigation and general price-checking. A home-front pledge campaign begun in 1943 enlisted the co-operation of millions of housewives in refusing to pay overceiling prices or accept rationed goods without paying ration stamps. Approximately 5,000 price panels were organized from volunteers who checked prices of cost-of-living commodities in retail stores. Trade associations also co-operated in effecting compliance among their members. An anti-inflation campaign was carried on by grocers in the fall of 1944 and early in 1945.

While the term black market was not generally applied to violations of rent and eviction control regulations, extensive violations were uncovered in this field. In some instances, these violations were systematically organized by a small minority of rental agents and large rental organizations. They may be termed in every sense black markets. Such devices as compelling tenants to pay bonuses or side-payments to get housing accommodations or to buy furniture or extra lots they did not want at exorbitant prices were used in some areas.

Black markets did not end with the war. However, many problems were eliminated with the lifting of rationing controls of all products except sugar by the end of 1945. Enforcement activities were then concentrated to stop violations of price ceilings and maximum rents. Price violations in some commodity fields stemmed from the fact that while supplies were moving in civilian channels, the amount available was far

below the volume needed to satisfy accumulated demands.

During 1945, several other government agencies aided the Office of Price Administration in its enforcement activities. These included the alcohol tax unit and the bureau of internal revenue of the treasury department and the department of justice. These agencies co-ordinated their work most effectively. Joint investigation and prosecution of black market operators uncovered overceiling sales and prevented violators from concealing their illegal gains through filing fraudulent income tax returns. Despite numerous, and sometimes widespread violations, ceiling prices were generally maintained and the bulk of rationed commodities was distributed in compliance with OPA's fair distribution controls.

It was apparent that until supplies of scarce commodities more nearly equalled demand, the black market and danger of inflation would continue. But improved enforcement procedures coupled with concentration of activity against price and rent violations were expected to enable the government to cope with them.

(C. Bs.)

**Blamey, Sir Thomas Albert** (1884- ), Australian army officer, was born Jan. 24 in Wagga Wagga, New South Wales. He joined the commonwealth military forces in 1906 and served as chief of staff of the Australian corps during World War I. After the war, Sir Thomas, who was knighted in 1919, became deputy chief of the Australian general staff, 1920. He later became 2nd chief of the general staff of the commonwealth military forces (1923-25). He assumed command in 1940 of the 1st Australian army corps. Transferred to the Australian forces fighting in the middle east, he was promoted in 1941 to deputy commander in chief of the British middle east armies. In March 1942, Sir Thomas returned to Australia, took command of the Australian armies, and played an important role in the New Guinea operations, 1942-44. With the rank of lieutenant general, Sir Thomas commanded Allied land forces in the Southwest Pacific and was second in command to Gen. Douglas MacArthur. In May 1944, Sir Thomas was involved in a dispute with Lt. Gen. Henry Gordon Bennett, who charged that he was forced out of the Australian army by Blamey because he was associated with the ill-starred Malaya campaign and because his (Bennett's) escape from Singapore was "ill-advised." Sir Thomas answered that Bennett had been placed on the retired list at his own request. Sir Thomas was aboard the U.S.S. "Missouri" during the Japanese surrender ceremony in Tokyo bay, Sept. 2, and signed the document for the Australian government.

**Bolivia.** A land-locked republic in south central South America. Area, 416,040 sq.mi.; pop. (1944 est.), 3,533,900. The legal capital is Sucre (est. pop., 30,000); the real seat of government is La Paz (est. pop., 301,000). Other cities (with est. pop.) include Cochabamba, 60,000; Oruro, 50,000; Potosí, 40,000; Santa Cruz, 32,800 and Tarija, 27,000. Racial distribution is estimated to be 54% Indian, 31% mestizo and 15% white. Bolivia is a unitary republic with a president popularly elected for a four-year term, a bicameral congress composed of a senate of 27 members and a chamber of deputies of 110, and a judiciary headed by a supreme court of justice. Bolivia is predominantly Roman Catholic. President in 1945: Lieut. Col. Gualberto Villarroel.

**History.**—Political conditions continued disturbed, with repeated charges of repression, in 1945. It was charged in January that two opposition senators who were missing had been executed by the government following an abortive rebellion in Nov. 1944; bodies of the two men were found in a mountain gorge near La Paz on Jan. 25, 1945. An unsuccessful attempt

was made March 12 to assassinate President Villarroel. Exiled Bolivians in mid-June organized at Santiago, Chile, a Frente Democrático Boliviano with ex-ambassador to the U.S., Dr. Fernando Guachalla, as head; the chief one of the opposition groups composing it was the long outlawed Partido de Izquierda Revolucionario (P.I.R.), headed by the exiled Senator José Antonio Arze. Foreign Minister Gustavo Chacón announced March 19 that relations with the U.S.S.R. would be established. The government on Sept. 28 ended diplomatic relations with the Franco regime in Spain and announced that its interests would be handled by Peru. A train wreck Aug. 25 killed 35 persons and injured 53.

**Education.**—Enrolment in 1,766 primary schools in 1942 totalled 160,283; in 77 intermediate schools it was 11,255. Literacy was estimated at only 20%.

**Finance.**—The theoretical monetary unit is the gold peso, valued in 1945 at 20.6 cents U.S.; most transactions, however, are carried on in terms of bolivianos, valued in Dec. 1945 at from 1.67 to 2.36 cents U.S. The 1945 budget, approved Feb. 10, totalled approximately \$25,040,000 and included about \$5,300,000 for the armed forces. A budget surplus of 71,526,362 bolivianos was reported for 1944. Governmental indebtedness to the Banco Central increased only slightly in 1944, principally because of the severe restriction of public works and the determination to check inflation. A loan from the Export-Import bank was authorized Jan. 5, 1945. Total Export-Import bank commitments to Bolivia as of June 15 were \$15,500,000, all of it listed as an undisbursed balance. Total lend-lease advances to July 1 were \$4,392,000. A governmental decree April 3 re-adjusted the percentage of exchange that must be sold to the state by exporters of tin; a similar decree Jan. 25 had applied to nonmineral exporters. The result, it was thought, would be to make more foreign exchange available. The government in July announced plans to spend 26,200,000 bolivianos on a hospital for workers at La Paz. Approximately 80,000,000 bolivianos were appropriated in November for public works programs. Need for additional foreign capital led to the passage of a law Oct. 17 extending special protection to new investments in excess of 5,000,000 bolivianos in agriculture, manufacturing, production of electric energy, commerce, housing, mining, and other fields. Economic prospects for 1946 appeared unfavourable late in 1945; inflation continued and taxes apparently would have to be increased. President Villarroel estimated that ten years would be required to restore economic equilibrium.

**Trade and Communication.**—Tapered U.S. mineral purchases and long delay in completing negotiations for a new tin contract unfavourably affected Bolivian foreign trade in 1945. The Patiño and Hochschild mining companies advised the government on March 24 of plans to close three tin mines because of the allegedly unprofitable price offered. With the cessation of the tin procurement contract with the Foreign Economic administration on June 30, tin purchases continued for a time on a day-to-day basis. Rubber exports to the U.S. in the first half of 1945 were 2,170 short tons. Exports of crude petroleum and fuel oil in 1944 were 116,497 bbl. as against 125,680 bbl. in 1943.

Railway mileage totalled 1,407. The principal construction project in 1945 was the Bolivian section of the transcontinental line from Arica, Chile, to Santos, Brazil. The railway, 2,300 mi. in length, was expected to be completed in 1947. Highway mileage was 3,710, much of which was not improved. A contract was signed July 17 with a U.S. firm to construct a 305-mi. highway from Cochabamba to Santa Cruz at a cost of \$11,000,000.

**Production.**—Bolivia is primarily a mineral-producing country; the government took steps in 1945 to make it more nearly

self-sufficient agriculturally and it was announced that extensive agricultural colonization projects in eastern Bolivia would be undertaken in 1946. Tin production in the second quarter of 1945 was 13,363 short tons as against 10,333 short tons in the first quarter of 1945. Tungsten production in the second quarter was 74,097 short tons as against 43,896 in the first quarter. Crude petroleum production in 1944 was 313,947 bbl. (1943, 334,113 bbl.). The government late in 1945 was considering plans for a new lead smelter in southern Bolivia at a cost of \$100,000.

**Bong, Richard Ira** (1920–1945), U.S. air officer, was born Sept. 24, in Superior, Wis. After leaving high school, he attended Wisconsin State Teachers college in Superior, but quit after two and one-half years to take up a training course with the Civil Aeronautics administration. He enlisted in the U.S. army air corps in Sept. 1941 and became a flier in Jan. 1942. In the autumn of that year, he was sent to the Southwest Pacific with the 5th fighter command. He was credited with downing 40 enemy planes, a feat which brought him 26 decorations including the congressional medal of honour. He shot down his 40th plane over Mindoro in the Philippines in Dec. 1944. His knowledge gained in battle experience was considered so important that he was returned to the U.S. and assigned to “nonhazardous” duty. Maj. Bong crashed to his death during a test flight of a jet-propelled plane, one of the army’s newest fighter models, near Burbank, Calif., Aug. 6.

**Book-collecting and Book Prices.** The rare-book trade, alike in England and the United States, had been undergoing a metamorphosis for some years before World War II. The young men were taking over—young men who knew the internals as well as the externals of the books they were handling. The war years took many of these young men into service, but most of them were back in the running by the end of 1945. These restored booksellers would oppose certain practices that obtained in the past. They were alert bibliographically; they did not hold with the “whatever was once thought right will always be right” school which was established and maintained by some of their elders. They had for long been gravely concerned about the inadequacy of auction house cataloguing, and there were indications that the early weeks of 1946 might see sensational developments in this regard.

Considerable bibliographical research was conducted, but with little hope of adequate presentation until a day of fewer critical shortages in the publishing field. The University of Pennsylvania Press issued George Parker Winship’s *The Cambridge Press 1638–1692*, described on the title page as “a re-examination of the evidence concerning the *Bay Psalm Book* and the *Eliot Indian Bible* as well as other contemporary books and people.” This distinguished monograph by a distinguished bookman gave the world for the first time an exhaustive and (unless new data turned up, which seemed not to be likely) a definitive account of the beginnings of printing in British America. Jay Monaghan’s *Lincoln Bibliography*, issued by the Illinois State Historical society, listed nearly 4,000 items in its two volumes.

*American Book-Prices Current* initiated its second half-century with its editor pro tem, Colton Storm of the Clements

Library at the University of Michigan, welcoming Staff Sergeant Edward Lazare back to the permanent editorship.

Prices continued to mount, though in general falling short of the excesses of 1929. That was the year of the fantastic Jerome D. Kern sale. Mr. Kern died late in 1945, and it is mildly ironic that few of the obituary notices made more than passing mention of his reputation as a book collector. It is heartening to note that inflation, so far as the rare book trade is concerned, did not reach the point it attained 17 years earlier, just before the most disastrous deflation in modern history.

The most important sale of 1945 was the dispersal of the first two parts of the Frank J. Hogan library. The American portion, sold in January, and the English (18th-20th centuries), sold in April, brought together \$285,828. The remainder of the Hogan library, English literature before 1700, including a Caxton Chaucer, a first *Pilgrim's Progress*, and a superb first folio Shakespeare, was scheduled for dispersal in the spring of 1946. The third and fourth parts of the John Gribbel collection (the first two parts were sold the previous season) brought, together, \$118,297. Important lots which changed hands during the year included: John Keats's *Poems* (London, 1817), presentation copy from Keats to William Wordsworth, \$9,750; James Fenimore Cooper's *The Spy* (New York, 1821), presentation copy from the author, \$7,600; William Makepeace Thackeray's *Vanity Fair* (London, 1847-48, original parts), \$4,500; Jonathan Swift's *Gulliver's Travels* (London, 1726), \$4,200; Percy Bysshe Shelley's *Adonais* (Pisa, 1821), \$3,250.

In quite another category was a somewhat frayed pamphlet written by one Lansford W. Hastings, the cover title of which is worth giving in full: "The Emigrant's Guide, to Oregon and California, Containing Scenes and Incidents of a Party of Oregon Emigrants; A Description of Oregon; Scenes and Incidents of a Party of California Emigrants; And a Description of California; With a Description of the Different Routes to Those Countries; And All Necessary Information Relative to the Equipment[,] Supplies, and the Method of Traveling." Hastings was identified as "Leader of the Oregon and California Emigrants in 1842." The publisher, George Conclin of Cincinnati, offered this manual in 1845 for "50 cents for single copy, or \$5 per dozen." A dozen would not have been a bad investment, for exactly 100 years later a "single copy" sold at auction in New York for \$1,250. (J. T. W.)

**Book Publishing.** The steady wartime slump in title production by U.S. publishers seemed at an end in 1945, with only 422 fewer titles than in 1944, as against a drop of 1,355 in 1944 from 1943. Peacetime interests were reflected in the expansion of such classifications as law, philosophy, ethics, fine arts and business. Juvenile books showed the greatest single increase for the year. History, which included war correspondents' reports, dropped from 530 to 343, which was to be expected. Technical and military subjects continued to decline and there was a drastic cut in titles for religion and theology. As in previous war years, although the number of titles grew smaller, the total number of books published remained at record high, limited only by a continued paper shortage and, in many cases, a shortage of manpower. Table I, compiled by *Publisher's Weekly*, summarizes U.S. book publication for 1944 and 1945.

**Best Sellers.**—Kathleen Winsor's *Forever Amber* moved up from fourth place in 1944 to head the 1945 list of fiction best sellers, with a sale of 868,630 copies during the year. *The Robe* by Lloyd C. Douglas, first on the list in 1944, moved down to second place with total sales of almost 2,000,000. T. B. Costain's *The Black Rose*, published in 1945, took third place, followed by James Ramsey Ullman's *The White Tower*, Sinclair Lewis' *Cass Timberlane*, Adria Locke Langley's *A Lion Is in the Streets*, James Hilton's *So Well Remembered*, Samuel Shellabarger's *Captain from Castile*, Gwethalyn Graham's *Earth and High Heaven* and Irving Stone's *Immortal Wife*. Leading the nonfiction best sellers in 1945

were three war books, headed by Ernie Pyle's *Brave Men* which rose from second place in 1944. It sold 687,450 (bookstore) copies during the year. In second and third place, respectively, were *Dear Sir*, Juliet Lowell's book of war humour and *Up Front* by Bill Mauldin, both published in 1945. Other nonfiction leaders were *Black Boy*, the autobiography of Richard Wright, *Try and Stop Me*, by Bennett Ceri, *Anything Can Happen*, by George and Helen Papashvily, *General Marshall's Report*, *The Egg and I*, by Betty MacDonald, *The Thurber Carnival*, by James Thurber and *Pleasant Valley*, by Louis Bromfield.

**Great Britain.**—British title production showed a negligible decrease for 1945 below that of 1944, but still represented a higher total than that of 1943, the lowest production point during the war period. Law and parliamentary books registered a gain for the year, as did art, architecture and sociology. Restrictions due to paper shortage continued to limit the total number of books produced. Table II, compiled by *The Book-*

**Borates.** The production of boron minerals in the United States increased from 256,633 short tons in 1943 to 277,586 tons in 1944, but still fell short of the 1941 peak of 301,282 tons. Five producers reported outputs of borax, anhydrous sodium tetraborate, kernite, boric acid and colemanite, all from California. The glass industry is the major consumer, but use in fertilizers was expanding.

Normally the United States supplies a large share of the world demand, and one-third or more of the domestic output

M5

was exported. During World War II exports dropped heavily, but a renewal of export sales after the war was expected to ease the shock of shrinking home consumption in markets no longer stimulated by war demands. (G. A. Ro.)

**Borneo.** A great island of the Malay archipelago, between 7° N. and 4° 20' S., 108° 53' and 119° 22' E.; 830 mi. long N.E. to S.W., 600 mi. maximum breadth; area (calculation of Topographical bureau, Batavia, 1894), 293,496 sq.mi. Pop., about 3,100,000, divided as follows: Dutch Borneo, 2,168,661 (census of 1930); British North Borneo, 270,223 (census of 1931); Sarawak, 600,000 (estimated); Brunei, 30,135 (census of 1931). About 5,000 Europeans and 250,000 Chinese are residents of Borneo. Most of the natives are Malay and Dyak tribesmen, living on a very primitive level of culture and social organization.

**History.**—The coastal towns of Borneo and the rich oil area around Balikpapan were seized by the Japanese during the first weeks of their southward advance after Pearl Harbor. The primitive life of the interior went on much as before. Some of the outlying areas of Borneo were retaken by Australian forces in 1945; and Japanese control came to an end entirely after the surrender in Aug. 1945. There were no reports of an extension to Borneo of the political disturbances which broke out in more thickly populated and socially advanced Java after the end of the war.

**Political Subdivisions.**—There are four administrative areas in Borneo: British North Borneo, the British protected states of Brunei and Sarawak and Dutch Borneo. The latter is much the largest part of the island, British North Borneo, Brunei and Sarawak being located in the northern and northwestern sections.

**British North Borneo.**—Area 29,500 sq.mi. Pop. (1931) 270,223. This included 340 Europeans, 236 Eurasians, 47,799 Chinese, 11,494 Malays. Principal towns: Sandakan (13,826) on the east coast and Jesselton on the west coast. Revenue in 1940, £503,436. Expenditure, £249,138. Imports, £1,164,198; exports, £2,364,891. There are 127 mi. of railways. The chief products are rubber, timber, copra, coconuts, dried and salt fish, tobacco, manila hemp, sago and rice.

**Dutch Borneo.**—Administratively Dutch Borneo is divided into three districts, the western and the south and eastern respectively. Population is sparse, averaging about eight per square mile. Most of the people live near the rivers and the practice of head-hunting, which is linked with the *adat*, or system of primitive superstitions and taboos which governs the lives of the natives, tends to act as a check on the growth of population. There was some migration from Java and Sumatra into the more accessible regions of Borneo.

Heads are believed to possess magic power and are preserved as trophies after being taken in raids on neighbouring tribes. Dutch administration and missionary influence helped to curb this habit; but it is still to be found in the regions of the interior which are far removed from the few towns and centres of administration. A feature of Borneo tribal life is the long house. The average length of these structures is 600 or 700 ft. and the house is divided into two parts, one for communal use, the other separated into quarters for single families.

The tribes fall into two categories, those which remain in their kampongs, or settlements, and those which lead a nomadic life, such as the Punans, Hebans and Bukats. The latter are fiercer and more enterprising and develop remarkable skill in jungle woodcraft and in canoeing through the treacherous rivers of Borneo, with their many rapids. There are great differences of language among the tribes, and there is no written script. Tattooing is widely practised and possesses ceremonial and re-

ligious significance.

**Economics.**—Most of the tribesmen maintain a simple subsistence economy, with rice as the staple food and pork as a luxury. They possess varied degrees of skill in such crafts as boat and house building, basket and mat work, weaving and carving. The oil wells in the neighbourhood of Balikpapan represent the most productive industry of the island. Borneo is known to possess mineral wealth in diamonds, gold, coal, rock salt, copper, iron and marble, but development has been on a very small scale. (See also BRITISH EMPIRE; NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES.) (W. H. CH.)

**Bose, Subhas Chandra** (1897–1945), Indian politician, was born of high-caste Hindu parents in Cuttack, Bengal. He was educated at Presidency college, Calcutta, and later at Cambridge university, England. Returning to India, he joined the Indian civil service and became a judge. He resigned his judgeship, however, and became mayor of Calcutta, 1930, and was named president of the India congress in 1938. In the period between these two posts, he spent a number of years in jail for his revolutionary activities. He was forced out of the presidency of the congress in 1939 when moderate elements objected to his ultimatum calling for independence or civil disobedience. He opposed India's entry into World War II and the "exploitation of India's resources for war purposes." Bose was again arrested in 1940. Following his release in Jan. 1941, he fled to Germany where he worked for the nazi propaganda minister. In June 1943, Tokyo announced that Bose had arrived in Japan. Shortly thereafter reports from Singapore stated that he had been elected to the leadership of the Indian Independence league and that he had set up the provisional government of Free India, under Japanese sponsorship. In Jan. 1944, he transferred his headquarters to Burma, and when the military situation became too tense he moved on to Bangkok. Bose died in an aeroplane crash in Formosa while en route to the Japanese capital, Aug. 19, according to a Tokyo radio announcement.

**Boston.** Ninth largest city of the United States, with a population of 770,816 by the federal census of 1940, Boston is a seaport at the head of Massachusetts bay and is the capital of the state of Massachusetts. Area, 43.9 sq.mi., comprising most of Suffolk county.

In Jan. 1945 the Massachusetts legislature suspended the sections of the city charter which required a special election to replace Mayor Maurice J. Tobin, who resigned on Jan. 4 to take office as governor of Massachusetts. Acting-mayor John E. Kerrigan became mayor for the unexpired term. In the regular nonpartisan election on Nov. 6, 1945, a mayor (4-yr. term), 22 councilmen (2-yr. term) and two school committee members were elected to take office Jan. 7, 1946. U.S. Rep. James M. Curley (Dem.) received 114,930 of the 247,477 votes cast for the six candidates for mayor. Rep. Curley (aged 71) had been three times mayor (first elected in 1914) and once governor of Massachusetts. At election time he was under a federal indictment charging misuse of the mails. A referendum proposal to raise councilmen's salaries from \$2,000 to \$3,500 was overwhelmingly rejected.

Boston celebrated victory in World War II enthusiastically. Great receptions were given Gen. George S. Patton, Gen. George C. Kenney, Adm. William F. Halsey and Gen. Dwight D. Eisenhower. Even more attention was given to planning to meet the problems of reconversion. The Greater Boston Development committee was formed. Little progress was made with the acute problems of traffic congestion and housing shortage but the Boston Port authority was reorganized and rapid

progress was made with the extension of Logan International airport. Regular commercial air service to London was inaugurated. Commonwealth pier was returned to commercial use. Shipping to Pacific ports was resumed.

Gov. Tobin headed a delegation which went by air to London to present the advantages of Boston as the permanent seat for the United Nations organization. The U.N.O. committee arranged to inspect the area in Jan. 1946.

All naval installations were combined into the Boston naval base. The Boston port of embarkation with the great Castle Island army base handled great quantities of troops and cargo. Its use for troops was discontinued Dec. 31, 1945.

The 1945 tax rate was \$42.50 (1944=\$39.90) on an assessed valuation (real and personal) of \$1,479,172,000, an increase of \$37,163,600. Budget: \$80,145,296.47, an increase of \$3,495,576.67 for the same services. Welfare expenditure (old age and dependent children) was \$9,960,000, including federal grants of \$3,430,000. The retirement fund (1944) had 14,131 members and disbursed \$13,603,139 to 2,000 beneficiaries. In the period Jan.-Oct. 1945, bank clearings increased 6.4%; bank debits increased 8.8%; department store sales increased 11%; manufacturing employment increased 10.3%; manufacturers' payrolls decreased 8.4%. (S. J. McK.)

**Botanical Gardens:** see BOTANY.

**Botany.** During 1945, botanical investigations in most countries of the world were profoundly influenced by wartime conditions. While it is true that most of the standard botanical journals continued to publish regularly, the amount of material which they printed was considerably below prewar levels. This reduction was caused not so much by a reduction in total activity but rather by a shift to war work, the results of which were often confidential and not immediately available for publication. The close of the year, however, saw a beginning in the release of material previously held secret, and it was expected that a large accumulation of such material would be published during 1946.

Many botanists found opportunity for war research in the fields of medicine, chemistry and physics. A large number, however, made their contribution in some field of plant science. One of the most active of these fields had to do with the antibiotics, of which penicillin is the best known example. The discovery of this substance, produced by one of the common blue moulds, *Penicillium notatum*, stimulated many botanists and bacteriologists to a search for other organisms containing this or comparable substances. The search covered not only bacteria and fungi, but also green plants including algae and the higher plants. Antibiotics have been found in many different plants, including very diverse strains of soil bacteria, fungi, algae and the flowering plants. A number of these were investigated intensively in 1945. In addition to this work, attempts were made to increase the yields of the best strains of *Penicillium* by the use of various types of radiations, such as X-rays and ultra-violet light. Considerable success attended these efforts.

On the other hand, it was found that strains of bacteria susceptible to the action of specific antibiotics may mutate and thus become immune. The danger was thus recognized that indiscriminate use of antibiotics may serve merely to eliminate nonresistant strains, leaving the field to the resistant ones. An extensive program of research was, therefore, begun in 1945 to study mutation in disease micro-organisms in order to learn how best to cope with this situation.

Plants constituted the chief or only source of many substances other than antibiotics which were important in the war effort, such as certain of the vitamins, and reagents such as

glycerol, butyric acid, acetone and ethyl alcohol. Many botanists were engaged in a search for new and superior natural sources of these and other products and in attempts to increase production of them.

Another important field of botanical research involved work with rubber-producing plants, particularly with the Russian dandelion (*Taraxacum kok-saghyz*), guayule (*Parthenium argentatum*) and *Cryptostegia*. The United States department of agriculture carried on an extensive program involving a search for new and better sources of natural rubber, as well as investigations designed to increase yield and improve quality.

The search for new sources of quinine also continued actively during 1945. A number of expeditions were in the field in various parts of the Andean region. As a result, new species containing quinine were discovered and the cinchona plant was found in large areas not hitherto known to contain it. Investigation of a variety of seaweeds as potential sources of agar and of other important colloids continued, an excellent summary of this situation appearing in *Science* for June 15, 1945. A comprehensive study of the deterioration of fabrics and many other products, including optical glass, through the action of fungi, occupied the attention of many botanists. Many others were engaged in the development of new insecticides, including DDT.

During 1945 extensive search was made in many parts of the world for plants which would provide new sources of medicinals, insecticides, foods and drugs, oils and many other products. Thus, in the U.S.S.R., an extensive search was made for new vitamin-bearing plants, especially for better sources of vitamin C, as well as for new medicinal plants, tea and coffee substitutes, etc. Many new products were developed, some of which would no doubt have a permanent value.

An important botanical activity during World War II was the publication of handbooks, for the use of the armed forces, dealing with food and medicinal plants and other plant resources in the several war theatres. Several of these appeared during 1945. For the most part they were not made available to civilians. A few became available, however, and these are listed at the end of the article. These handbooks were of great help, especially in the western Pacific areas.

Fewer botanical events of importance occurred during 1945 than in most years, as a result of the war. Mention may be made, however, of the 50th anniversary of the New York Botanical garden celebrated during May 1945; announcement that the John Innes Horticultural institution had procured a large tract of land at Bayfordbury, Hertfordshire, England, to which it would move; and the establishment by the Academia Sinica of a new research institute of botany at Pehpei, near Chungking. On account of travel restrictions, most botanical societies in the U.S. cancelled their annual meetings in 1945, and official activities were largely in abeyance. In a few parts of the world, however, such as Sweden, botanical activities were little affected by the war, and large quantities of research were published.

Graduate students in botany were few in number in the U.S. in 1945 owing to the fact that they were not given occupational deferment from military service. As a result, a serious shortage of well-trained young botanists was expected to handicap the profession for years to come.

Books published during the year include: *Structure and Reproduction of the Algae*, vol. 2, by F. E. Fritsch; *Industrial Mycology*, by George Smith; *Manual of the Aspergilli*, by Charles Thom and Kenneth P. Raper; *Plants and Plant Science in Latin America*, by Franz Verdoorn; *A Manual of Soil Fungi*, by Joseph C. Gilman; *Native Woods for Construction Purposes in the Western Pacific Region*, and *Native Woods for Construction Purposes in the South China Sea Region*, by J. H. Kramer (booklets for the armed forces). (See also BIOCHEMISTRY; GENETICS.)

BIBLIOGRAPHY.—U.S. Dept. of Agri., *Bibliography of Agriculture; Annals of Botany; American Journal of Botany; Botanical Gazette; Science; Nature; Biological Abstracts; Botanical Reviews*. (R. E. Cd.)

**Botanical Gardens.**—It was possible by the end of 1945 to get a comprehensive picture of the damage done to botanical gardens by World War II. The herbarium and library of Komarov Institute of Botany at Leningrad, U.S.S.R., suffered no loss, but living plants in the greenhouses were destroyed because of glass breakage. The Siberian part of the herbarium at Kharkov was moved to Leningrad and saved. The Germans confiscated the herbarium at Kharkov, the herbarium of Ukrainian Academy of Science at Kiev and the Nikita Botanical garden herbarium near Yalta. The botanical library and herbarium of Caen, France, were completely destroyed, also the library, greenhouses and herbarium of the Berlin Botanical garden. No loss was suffered by great historical botanical collections at Muséum d'Histoire Naturelle, Paris. The botanical department of the British museum lost many monocotyls but saved all type specimens. Oxford had its important ancient herbarium below ground. While Kew had greenhouses damaged, the staff and materials were moved to Oxford, suffering slight loss. The British Museum of Natural History had a near miss but the Arctic botanical collection was saved.

Soviet Academy of Sciences was planning a new botanical garden of 650 ac. at Moscow with Nikolai Tsitsin, the originator of perennial wheat, as director. It was to consist of large conservatories, laboratories, halls and ornamental plantings. Cornell plantations, Ithaca, N.Y., a domain of more than 3,000 ac. including lands of the university and state agricultural colleges, were to be developed as an integral unit under the direction of Dr. L. H. Bailey. A study would be made of the effect of climate, sites, soils, etc. on plant societies. There were to be permanent wildlife areas, areas planted as beauty spots, and recreational and agricultural areas. New York Botanical garden had botanical expeditions in Mexico, Ecuador and in the intermountain region of the central U.S. The botanical institutions of Harvard university were winding up several government and military projects. Brooklyn Botanic garden discontinued the garden *Record* and publishes instead a quarterly, *Plants & Gardens*, a semipopular gardening and horticultural journal; instituted a pension and annuity plan; and elected Dr. Conrad B. Link to fill the position of horticulturalist left open by the resignation of Mr. Montague Free. The University of Wisconsin arboretum, Madison, Wis., added 15,000 trees to its Tamarack association and 1,500 *Thuja occidentalis* trees to the White Cedar association. The University of Washington arboretum, Seattle, Wash., held its first display of flowers of hybrids of azaleas and rhododendrons from crosses made in 1940. A number of colour forms superior to types on the market appeared. Missouri Botanical garden, St. Louis, Mo., continued its extensive studies on light relations of plants, on growth of orchids in culture solutions and published results in the garden *Bulletin*. They studied the relation of cattle to the establishing of bluegrass meadows. The *Annals* published material on corn studies in Central America, a continuation of the *Flora of Panama*. Morton arboretum, near Lisle, Ill., issued a graphic illustrated bulletin and work sheets for plant study classes which were being used in nature schools throughout the U.S. Montreal Botanical garden started a new department of plant breeding and applied plant physiology. At the request of their own gardeners they started a course in basic botanical training for practical gardeners.

**BIBLIOGRAPHY.**—E. D. Merrill, "Notes on Russian and other European herbaria," *Science*, vol. 101, no. 2623, p. 355 (April 6, 1945) and "News from abroad," *ibid.*, vol. 102, no. 2650, p. 372 (Oct. 12, 1945); "Report on bomb damage to botanical material in England," *Torrey*, vol. 45, no. 3, p. 96 (Sept. 1945). (W. C.)

**Bougainville:** see SOLOMON ISLANDS.

**Bovard, Oliver Kirby** (1872?–1945), U.S. newspaper editor, was born in Jacksonville, Ill. From grammar school he went on to clerical jobs and started his newspaper career with the *St. Louis Star* in 1896. Two years later, when that paper refused to run an exposé he had written, he went to the *St. Louis Post-Dispatch* where his article was accepted and he was given a job. In 1900, he was made city editor and in 1908, managing editor. Shortly afterward, Joseph Pulitzer, founder of the *Post-Dispatch*, invited him to work on the *New York World* of which Pulitzer was director. After ten months, Bovard was offered the choice of becoming assistant managing editor of the *World* or returning to St. Louis as managing editor of the *Post-Dispatch*. He chose the latter. Among newspaper men, he enjoyed the reputation of being one of the greatest editors in the United States; commensurately, he was one of the highest paid. He would ruthlessly eliminate extraneous material from stories, and his ability to detect inaccurate and incomplete facts was uncanny. His watchword to his staff, cubs and veterans alike, was: "If through his reliance on you the reader is misinformed or inadequately informed, you have failed in your professional duty." Such men as Frederick Hazlitt Brennan, author, Paul Y. Anderson, who exposed the Tea Pot Dome scandal, Joseph Driscoll, Jack Alexander and a host of other prominent figures in U.S. journalism were products of the rigorous Bovard training. In 1938, Bovard turned in his resignation to the younger Pulitzer, son of the founder, "because of irreconcilable differences of opinion as to the general conduct of the paper." Bovard died in St. Louis, Mo., on Nov. 3.

**Bowles, Chester** (1901– ), U.S. advertising executive and government official, was born in Springfield, Mass., Aug. 5. A graduate of Yale, 1924, he became an advertising copywriter and together with William Benton formed the advertising firm of Benton and Bowles, July 1929. Bowles was made chairman of the board of that company in 1936. In Jan. 1942, he took a leave of absence to work on a dollar-a-year job in Connecticut, later becoming OPA administrator for the state. On July 15, Prentiss M. Brown, then OPA national director, named Bowles as general manager of his agency. On Oct. 25, 1943, Bowles succeeded Brown who had resigned four days earlier as OPA administrator. Throughout 1944 and 1945, Bowles battled continually and vigorously to maintain price controls. His stand was unpopular with many businessmen, and he was subjected to a sustained barrage of intensive criticism. He denounced, Dec. 5, "the small minority of business pressure groups" in which he included the National Association of Manufacturers, who he said were trying to abolish price controls, and predicted inflation "followed by a shattering smashup" if controls were not maintained and extended to 1947.

**Bowling.** Bowling closed its restricted wartime program with new champions in singles, doubles and team, all contested in match rather than tournament competition. The sport turned to a prewar basis in 1946, scheduling the American Bowling congress for Buffalo, N.Y., and the women's international for Kansas City, Mo.

Joe Wilman, late of U.S. army, won the individual championship with a 210-pin average in the 16-man final, toppling 13,437 pins in 64 games. The firing of the 40-year-old Berwyn, Ill., bowler dethroned Herbert "Buddy" Bomar of Chicago, who finished 12th in his attempted title defense. Wilman, who as an army private finished second in 1944, accounted for 310.12 in the points scoring to 305.37 for Pvt. Thurman Gibson of Detroit. Andy Varipapa of Hempstead, L.I., was third, 303, fol-

BOTH CONTESTANTS topple through the ropes in their light-heavyweight bout during the semifinals of the 1945 Golden Gloves boxing tournament in Chicago. Robert Wilson, on the bottom, won the decision from Sgt. Truman Swingle

lowed by Walter Ward, Cleveland, 296.26, and Ned Day, West Allis, Wis., 296.13.

William Kenet and Walter Reppenhagen of Detroit wrested the doubles title from Bomar and William Flesch, Chicago, by a score of 27½ to 20½. Reppenhagen and Kenet were runners-up in the 1944 doubles competition. The E. and B. team of Detroit ended a four-year reign of the Stroh Bohemians, also of Detroit, as match game champions, winning the title test by 254 pins. (M. P. W.)

**Boxing.** Boxing was a sport of contradictions in the U.S. during 1945. Champions were conspicuous by their absence on the competitive horizon, yet the sport boomed. Inferior boxers were paired for spectacular bouts. Mediocre boxers commanded unbelievable purses. A bout with a normal box-office value of \$3.30, including tax, assayed at a box-office maximum of \$16, including tax, and people, figuratively, trampled each other in the rush to buy tickets.

Joe Louis, world heavyweight champion, was inactive; so was his most dangerous challenger, Billy Conn, Pittsburgh, Pa. They did no fighting because they were serving their country. Gus Lesnevich, world light-heavyweight champion; Tony Zale, world middleweight champion; Freddie (Red) Cochrane, world welterweight champion; Bob Montgomery, one of the recognized lightweight champions; Manuel Ortiz, world bantamweight champion—all were idle so far as defense of their titles was concerned. Like the foremost challengers in the different ring divisions, all champions received discharges from the army, the navy, the coast guard soon after the war's actual fighting ceased. But the amazing fact remained that, even with the lack of championship appeal, boxing enjoyed a remarkable year.

Two championship bouts were held. Only one of them was an undisputed championship. In this event Willie Pep, Hartford, Conn., world featherweight titleholder, held his honours

against Phil Terranova, the Bronx, New York city. They fought in Madison Square Garden on Feb. 19 and Pep won a 15-round decision. A crowd of 10,427 persons saw the battle, paying receipts of \$48,701. The other championship was in the light-weight class. Ike Williams, Camden, N.J., knocked out Juan Zurita, Mexican, who was recognized as champion by the National Boxing association, in two rounds of a bout held in Mexico City in April, to gain N.B.A. recognition. In New York state, and in those states which co-operate with New York in the administration of boxing, Bob Montgomery, Philadelphia, Pa., was recognized as champion. He was in service until early December.

As a barometer of the remarkable year, Madison Square Garden in New York offered the greatest illustration. In 43 boxing carnivals under the direction of Mike Jacobs, president of the Twentieth-Century Sporting club, more than \$2,250,000 was attracted to the box office, a figure paid by more than 500,000 sport followers. The only championship event on the Garden's calendar was the February battle between Pep and Terranova. For the rest, the competition was supplied by run-of-the-mine boxers, many of them of moderate national reputation. Tommy (Rocky) Graziano, of New York's east side, who was little more than a preliminary boy when the year started, was the most conspicuous performer on the basis of results and receipts. He boxed five times in the Garden, scored five knockouts, included two ten-round knockouts over welterweight champion Cochrane among his exploits, and was a participant in two of the three matches which grossed in excess of \$100,000, including the year's largest gate.

Graziano knocked out Harold Green of Brooklyn in three rounds in September, before 18,592 persons who paid \$103,970, the year's largest crowd as well as the year's greatest gate receipts. Graziano knocked out Cochrane for the second time in ten rounds in August, before 18,071 persons who paid receipts of \$100,469. Graziano had knocked out Cochrane in ten rounds in June before 14,972 persons who paid \$72,861. The other

match to exceed \$100,000 in receipts was a heavyweight bout in which Tami Mauriello, Bronx, New York city, defeated Lee Oma, Detroit, Mich., in March. A crowd of 18,291 saw this bout, and the receipts amounted to \$101,918. Several matches exceeded \$90,000 in receipts.

An unusual feature of the Garden's year was the arena's use as a boxing centre between April and September for the first time in history. Promoter Jacobs conducted 15 carnivals there between the departure of the circus, normally the summer's closing time, and Labor day.

Boxing was relatively popular, too, in such centres as Chicago, Ill., Philadelphia, Pa., Boston, Mass., Washington, D.C., Cleveland, O., Detroit, Mich., Baltimore, Md. and in California cities.

Amateur and collegiate boxing proceeded on a restricted scale. Finals in the Amateur Athletic union's national championships, held in Boston in April, attracted 8,613 persons and saw a wide distribution of titles. Boxers from New Orleans, La., Oklahoma City, Okla., Philadelphia, Chicago, Buffalo, Alexandria, Va., and Cleveland were returned champions. A feature of the tournament was the success of two Indian participants, Amos Aitson and Virgil Franklin, members of the Oklahoma City team, who won the bantamweight and featherweight championships, respectively.

The United States Coast Guard academy at New London, Conn., won the Eastern Intercollegiate Athletic association boxing championship team title, in the annual title tournament held in March in New London. The coast guard amassed 31 points, dislodging West Point as champions. (J. P. D.)

**Boyington, Gregory** (1913?— ), U.S. air officer, was born in Coeur d'Alene, Ida. He was graduated as an aeronautical engineer from the University of Washington (Seattle), and worked as a draftsman before he joined the marines as a cadet in 1935. During the Sino-Japanese war, Boyington joined Gen. Claire Chennault's "Flying Tigers." After the United States entered World War II, he rejoined the marines, soon won a commission as a major and commanded a fighter squadron in the Southwest Pacific. A remarkably steady and cool-nerved pilot, he shot down 20 Japanese planes in that area, which, added to the six he had destroyed while a Flying Tiger, brought his total to 26, equalling the record Capt. Edward Rickenbacker established during World War I. Some sources credit Boyington with having shot down 28 planes in all. On Jan. 3, 1944, he was shot down while on a mission over Rabaul, New Britain. It was later learned that he was picked up by a Japanese submarine and was imprisoned in Japan where he was brutally mistreated by prison guards. On Aug. 30, 1945, it was disclosed that Boyington was rescued from the Omori prison camp. He was subsequently returned to the United States.

**Boy Scouts.** Emphasis by the Boy Scouts of America in 1945 was on world scouting. The theme of the year was "Scouts of the World—Brothers Together." This was developed in several ways.

The World Friendship fund to help rebuild scouting abroad was developed. The first allocation was made to the Philippines. The World Friendship edition of *Scoutmastership* by the founder of scouting, Lord Baden-Powell (1857-1941), was published for the benefit of scouts in foreign countries. The International Scout committee met in London in Nov. 1945. World scouting matters were discussed, including plans for the next World Jamboree or gathering of representatives of all the scout nations, which was scheduled for 1947.

Scouts carried on important war service in 1945 at the request of the government. Some spectacular activities included: two war loan campaigns, in recognition of which minute man

CHINESE BOY SCOUTS convert old gasoline barrels into a pontoon bridge. The scouts rendered valuable service to their country during World War II, as air-raid signallers, medical attendants and aids at the front

flags and banners were awarded; the General Eisenhower Waste Paper campaign in March and April and months following in which more than 500,000 tons of paper were collected; the United Nations' clothing collection, in which one-tenth of all the clothing collected was the result of scout efforts; the Green Thumb campaign in which thousands of scouts helped grow food for freedom.

Senior scouting, which includes air scouting, explorer scouting and sea scouting, attracted thousands of boys. A new unit of scouting, the senior scout outfit, was authorized.

The 35th meeting of the National council, streamlined to meet wartime conditions, was held in New York city in May 1945.

There was a large increase in membership over the previous years. As of Dec. 31, 1945, the membership was as follows:

Total boys.....	1,533,718
Total leaders.....	443,745
Total membership.....	1,977,463
Scout units.....	61,026

**Great Britain.**—Lord Rowallen was elected chief scout of the British Boy Scout association. John Skinner Wilson was appointed director of the International Scout bureau located in London. The International Scout bureau, which had been maintained in spite of overwhelming handicaps during World War II, resumed full-time operation. Plans were developed to bring up to full prewar status *Jamboree*, the international scout magazine, and the *Scouter*, the British headquarters publication. These were issued regularly during the war in reduced format. St. Georges day, April 23, which is International Scout day, was observed by special exercises. Many scout organizations from invaded countries, which had developed temporary headquarters in England, reopened their headquarters in their home lands. (L. W. BA.)

**Bracken, John** (1883— ), Canadian political leader, was born at Ellisville, Ont., on June 22, and graduated from the Ontario Agricultural college, and the University of Illinois. After graduation Bracken went into the prairie provinces as a seed inspector for the Canadian government. He became professor of field husbandry at the University of Saskatchewan, and later president of the Agricultural college

of Manitoba. In 1922 he was offered, and accepted, the leadership of the newly formed Agrarian or Progressive party in the province of Manitoba. He was returned to the legislature in a by-election held in Le Pas. In 1932 he headed a coalition government of Progressives and Liberals, and later the coalition principle was extended to include Conservatives, Co-operative Commonwealth Federationists and Social Credit members. In Dec. 1942, he emerged as a national figure, when he was chosen national leader of the Conservative party by a nominating convention meeting at Winnipeg. In deference to his views, the name of the party was altered to Progressive Conservative.

Bracken did not seek election to the house of commons, but on Oct. 20, 1944, he accepted nomination for Neepawa, Manitoba, in the general elections. In Jan. 1945, Bracken returned from a visit to western Europe, in the course of which he interviewed Canadian troops. With the opening of the general elections campaign, he made an extensive political tour which covered the entire country. In this way he was able to meet the electors and place the program of the Progressive Conservative party before them. In the polling on June 11, Bracken was returned for the riding of Neepawa. With the beginning of the session, he became the official leader of the opposition in the house of commons.

(J. I. C.)

**Bradley, Omar Nelson** (1893— ), U.S. army officer, was born in Clark, Mo., on Feb. 12. He was graduated from the U.S. Military academy in 1915 and later from the Infantry school, the Command and General Staff school and the Army War college. Early in 1941 he was commandant of the Infantry school, and in Feb. 1943 he was sent to North Africa where he assumed command of the 2nd corps, which he led to victory at Tunis and Bizerte. In Jan. 1944 Gen. Dwight D. Eisenhower disclosed that Bradley had been made commanding general of the U.S. ground forces for the invasion of Europe. When the invasion started, June 6, Bradley headed the U.S. 12th army group. On Aug. 30 it was disclosed that Gen. Bradley had been given equal status with Gen. Bernard L. Montgomery. The U.S. armies under Bradley's command hammered their way into the Siegfried line by the winter of 1944. During the German counterattack in the Ardennes forest, Dec. 1944, the 1st and 9th U.S. armies were shifted from Bradley's command to Montgomery's until the nazi drive was contained. Both armies were subsequently returned to the 12th army group. Explaining the German breakthrough, Bradley declared that the thinness of the U.S. line at the Ardennes bulge was the result of a "calculated risk" in which surplus divisions were used to attack in other sectors. He was nominated, March 13, 1945, to the temporary rank of a full general and on June 7, he was named by Pres. Truman as administrator of veterans' affairs.

**Brandeis, Alice Goldmark** (1866?–1945), U.S. suffragist, was born in Brooklyn. In 1891 she married Louis Dembitz Brandeis (later an associate justice of the U.S. supreme court) and they settled in Boston where her husband was on the faculty of Harvard law school. Mrs. Brandeis took an active interest in social reform, women's suffrage and juvenile delinquency. In 1928 she became vice-chairman of the Progressive League for Alfred E. Smith, the Democratic nominee for president. She campaigned among those elements who had cast their ballots for Sen. Robert M. La Follette in 1924, urging them to swing their votes to Smith. After her husband's death in 1941, she maintained an active role in the World Zionist organization and the Jewish Agency for Palestine. Following the race riots in Detroit in 1943, Mrs. Brandeis was among the many prominent and influential people

who signed an appeal calling for racial amity, which was submitted to the president. She translated *Recollections* (1929), the work of her uncle, Karl Goldmark, the noted Hungarian composer. Mrs. Brandeis died in Washington, D.C., Oct. 11.

**Brazil.** A republic in eastern and central South America and the most populous Latin country in the world; language: Portuguese; religion: predominantly Roman Catholic; capital: Rio de Janeiro (1945 pop.: 1,941,700); president: until Oct. 29, 1945, Dr. Getulio Vargas (from 1930), and for the remainder of the year (until inauguration in February 1946, of president-elect General Eurico Gaspar Dutra), Dr. José Linhares, former chief-justice.

Brazil has an area of 3,291,416 sq.mi., second only to Canada in size in the western hemisphere. The country is divided into 20 states, a federal district and 7 territories, including the island of Fernando de Noronha, 225 mi. off the coast. (For individual areas and population see table.)

The population (1940 census: 41,570,341) was officially estimated at 45,300,000 as of Jan. 1, 1945. Twenty-two per cent of the population of Brazil is classified as urban, 9% as sub-urban and 69% as rural. The capital, Rio de Janeiro (coterminous with the federal district) is the largest city of Brazil.

**History.**—To Brazil's previous contributions to the United Nations Relief and Rehabilitation administration were added the promise to increase in 1945 by about 300,000,000 yards its exports of cotton fabrics to alleviate the acute United Nations textile situation. Although the Conference of Foreign Ministers of the American Nations (scheduled to be held in Rio de Janeiro in Oct. 1945) was postponed at the suggestion of the United States government, this action in no way was considered as derogatory to Brazil. During World War II the Brazilian navy acquired (mostly from the United States) about 30 warships, including sub-chasers, destroyers and corvettes.

Economically, the country continued prosperous although the cost of living continued to rise in an alarming way. At the end of 1944 the average percentage of increase in the cost of living was estimated officially at 250.78%. This led some to declare that no increase in the real national income had taken place. In fact, foodstuff production had declined on the per capita basis, since output had remained about 18,500,000 metric tons during a ten-year period, despite the increase in population.

Industrialization was declared to be the key to national prosperity. An Economic Planning commission was organized and at its first meeting (Jan. 10, 1945) it established three committees to consider plans for the improvement of transportation, development of electric power and fostering of immigration. Several important economic congresses were held during 1945; among them, the First Economic Congress of the West (including representatives of the states of Goiaz and Mato Grosso), and the National Economic Congress of Teresopolis (under the auspices of the federal departments of agriculture and commerce) were the most important.

The most dramatic event in the political history of Brazil in 1945 was the bloodless revolution of October which resulted in the overthrow of President Getulio Vargas. For some time there had been unrest throughout the country and dissatisfaction with the strict dictatorship of Vargas. The president had promised several times that elections would take place after World War II and that he would not seek re-election. On March 28 he issued a call for national elections to be held on Dec. 2. State executives and legislatures were to be elected on May 6, 1946. Most of the press, at last free from the restraints of censorship (abolished Feb. 22, 1945), poured criticism on the Vargas regime. Fearing that Vargas might break his promise and present himself as a candidate for re-election, the democratic ele-

ments rallied behind Air Brigadier Eduardo Gomes, a hero of the 1930 revolution, well-known throughout the country. Vargas countered with two important measures: the announcement of the candidacy of General Eurico Gaspar Dutra, his minister of war; and his reconciliation with communist leader Luis Carlos Prestes (in jail from 1936). This action was followed by the recognition of the U.S.S.R. on April 2. His opponents feared that Vargas intended, first, to divide the army between the two announced candidates, and then to win the backing of the labour party. He thus could, at any time, if he so wished, step in and present his own candidacy as the only way to preserve the peace of the country.

On Oct. 2, 1945, the Supreme Electoral Tribunal ruled that the congress to be elected Dec. 2 would have legislative, as well as constituent powers. This frustrated the efforts of the democratic elements who urged the postponement of the congressional elections until after the convening of the constituent assembly.

A few days later (Oct. 10) Vargas issued a decree advancing the date of the elections for state governors and legislatures from May 6, 1946, to Dec. 2, 1945. Suspicion that Vargas wanted to postpone all elections led General Pedro Aurelio de Goes Monteiro, minister of war, to declare publicly that the army was ready to see to it that the elections were held in freedom for all on the announced date. On Oct. 29, President Vargas appointed his brother, Benjamin Vargas, to be chief of police in the capital. Fearing that this was part of Vargas' plan to continue in power, General Goes Monteiro submitted his resignation which he withdrew only at the instances of the army and after Benjamin Vargas had been removed from his new position. During the night army troops occupied all strategic points in the capital and a guard was thrown around the presidential palace. A group of officers then visited Vargas and demanded his resignation, transferring his powers to Chief Justice Jose Linhares, in accordance with the constitution.

On Oct. 31 Getulio Vargas left Rio de Janeiro for his ranch in southern Brazil.

The new president pledged himself to hold elections on the announced date and to help to build up a democratic structure with the help of the armed forces. He revoked decrees providing for simultaneous elections of members of the constituent assembly and president of the republic, as well as state governors and legislatures. On Nov. 26 a decree was issued empowering the new congress to act as a constituent assembly.

Meanwhile, former president Vargas issued a declaration urging all Brazilian workers to join the Labour party as the heir and continuator of the 1930 revolution.

On Nov. 18, 1945, the Communist party announced that Yeddo Fiuza (former mayor of Petrópolis) would be its candidate to the presidency. The other candidates were: General Dutra, for the Social Democratic party; Brigadier Gomes, for the National Democratic union; and Mario Rolim Teles, for the National Agrarian party. The old (and abolished) Integralist party (fascist) supported General Dutra's candidacy. The workers were divided in their sympathy toward Dutra and Gomes.

The people responded enthusiastically to the invitation to participate in the first free election after 1930. A total of more than 7,600,000 people registered. Despite the high hopes of the National Democrats, General Dutra, the candidate of the Social Democrats was elected by a large majority.

Former president Getulio Vargas was elected to the senate for his native state of Rio Grande do Sul and seemed to have remained the power behind the throne.

At the end of 1945 it was reported that President Linhares had written a new provisional constitution based on the con-

CONFETTI showered from the buildings of Rio de Janeiro as the city welcomed the Brazilian expeditionary forces returning from Italy on July 18, 1945

stitution of 1891, which would be presented to the people and later possibly taken up as a basis for discussion by the constituent assembly scheduled to meet in Feb. 1946.

**Education.**—At the end of 1944 it was estimated that there were some 40,000 schools, with about 3,710,000 students. Of these schools, 39,000 were elementary and the remainder secondary, vocational and universities. There were seven universities, all of them state institutions except the University of Brazil (Rio de Janeiro), which is maintained by the federal government. There were also in many states schools of law, medicine and engineering maintained by the state governments but not organized as universities.

**Finance.**—The cruzeiro is the monetary unit, divided into 100 centavos. One cruzeiro is worth approximately 5 cents U.S. (free market rate, spring of 1945, U.S. \$0.0513).

In 1945 the estimated expenditures of the federal government totalled 8,205,300,000 cruzeiros, and receipts 8,232,400,000 cruzeiros, which left a nominal balance of 27,100,000 cruzeiros, as compared with a balance of 26,700,000 cruzeiros in 1944, and a deficit of 501,400,000 cruzeiros in 1943.

On June 9, 1944, when Brazil signed a new agreement with the representatives of the foreign bondholders, the Brazilian debt stood at 1,990,968,797 cruzeiros (including £17,500,656 and \$42,684,615). As of Dec. 31, 1944, the total paper money in circulation was 14,457,000,000 cruzeiros, which contrasted with 10,974,000,000 cruzeiros on Dec. 31, 1943. The value of money fell 60% between 1939 and 1943.

On Feb. 2, 1945, a controller of currency and credit was appointed with the main purpose of directing to government bonds available funds. It was reported that the government had sold about \$20,000,000 worth of gold in the open market to defend its currency from further depreciation.

**Trade and Communications.**—During the first seven months of 1945 the Brazilian exports totalled 6,089,602,000 cruzeiros (\$304,480,100) as against 5,789,411,000 cruzeiros (\$289,470,550) during the same period in 1944. The imports, during the first six months of 1945, totalled 2,099,952 metric tons, valued at \$213,172,450, as compared with 1,828,975 metric tons, valued at \$178,051,150 during the same period in 1944. During the first six months of 1945, the following export items were the most important: coffee \$81,436,250; cotton textiles \$28,663,750; raw cotton \$14,991,200; rubber \$9,532,700; pine \$8,895,200; carnauba wax \$8,698,200; hides and skins \$6,438,600; castor beans \$5,254,950; cocoa beans \$5,050,200; preserved meat \$3,882,600.

The United States continued to be the largest purchaser of Brazilian goods (54.15% of total in the first six months of 1945) and the largest exporter of goods to Brazil (61.5% of total during 1944). The total of Brazilian exports to the United States in the first six months of 1945 amounted to \$133,781,250.

Coffee continued the leading export item of Brazil, although its proportional importance had decreased to about 30% of total in the last few years. Brazil exported 13,558,122 bags of coffee of 132 lbs. each in 1944, valued at 3,900,000,000 cruzeiros, as compared with 10,100,000 bags, valued at 2,800,000,000 cruzeiros in 1943. There was considerable dissatisfaction over the ceiling prices for coffee established in the United States. It was alleged that those prices in terms of pre-1934 dollars, were roughly 8 cents a pound, compared with averages of 23 cents and 22 cents in 1928 and 1929 respectively. In Washington, D.C., the authorities at first refused to revise the prices, but later authorized an increase of 3 cents per pound, which permitted resumption of private exports of Rio coffees with reasonable margin of profit. The finer brands of Santos coffee remained, however, unprofitable. The Brazilian exporter claimed that the new prices remained lower than the prices paid by European countries.

The Inter-American Coffee board, which supervises the quota agreement with Latin American countries, also took action to encourage the increase of exports of coffee to the United States, ordering a substantial increase in marketing quotas for the year ending Sept. 30, 1945. This increase was considered of slight importance to Brazil. The Brazilian government authorized (June 11, 1945) a subsidy to the coffee growers involving a payment of about \$60,000,000 a year. The National Coffee department was extended to June 30, 1947, and the creation of a coffee credit bank was being considered.

The rubber purchasing agreement with the United States was extended until June 30, 1947, with the same prices retained. Other important export products were: Paraguayan tea (mate), oranges, babassu nuts, vegetable oils, mica, diamonds, quartz crystal, manganese, tungsten, tantalite, beryl, lumber, raw silk and silk textiles, bananas and other fruits. Before World War II Brazil exported about 5,000,000 boxes of oranges every year; during 1944 and 1945 the total was not more than 1,300,000 boxes.

Leading import commodities included machinery and miscellaneous manufactures, foodstuffs (largely Argentine wheat) and petroleum products. On Aug. 11, 1945, the import duty on wheat was abolished to ease the bread shortage.

External communications by air and sea improved in 1945 particularly after the surrender of Germany. Pan American World airways continued to provide daily air transportation north and south, with a connection through Corumbá to Bolivia

and the west coast of South America and a transatlantic link from Natal to Africa and thence to Europe.

The only external land connection consisted of a railway to Uruguay and highways to that country and Argentina, but a railway connecting with Bolivia and Chile was being constructed, Brazil having agreed to build a branch line from Corumbá to Santa Cruz, Bolivia; and Bolivia agreeing to build a highway connecting Santa Cruz to Cochabamba. Brazil was also building a branch line from Campo Grande, 894 km. west of Baurú, to connect with the Paraguayan port of Concepción on the Paraguay river. There was regular international communication by river boats plying the Upper Amazon and from Corumbá down the Paraguay and the Paraná rivers.

Seven aviation companies operated in Brazil during 1944. Brazilian military planes also flew regular mail schedules over numerous economically unprofitable domestic routes and to Asunción, Paraguay. In 1944 the air lines of Brazil totalled 116,165 km., and transported 244,516 passengers, 4,031,981 kg. of baggage, 774,091 kg. of mail and 3,469,207 kg. of freight.

Under normal conditions, coastwise and river steamer services are the main links between north and south Brazil and within the Amazon basin. In 1945 there were in operation about 21,750 mi. of railways, of which 90% were of one metre gauge and most of them south of Bahia. An extensive building program was being carried out by both private-owned and government-owned railways. This program also included improvements such as electrification, gauge-widening, double-tracking and general improvement.

Surface roads totalled about 37,280 mi. and common roads about 124,000 mi. Work continued on highway connection as planned on March 20, 1944, including 6 major north-south, 15 west-east, and 7 connecting roads, of some 24,000 mi. in total length. Imports of gasoline increased after June 1944, alleviating somewhat the transportation problem.

The U.S. Export-Import bank granted Brazil a \$38,000,000 credit for the purchase of 14 merchant ships to be built in the United States.

**Agriculture.**—Agriculture continued to be the basis of Brazil's economy, accounting, with livestock and forest products, for 80% of total value of the country's exports. Beef production declined because of killings for the supply of meat to the Allied nations. In 1944 beef exported totalled 33,600 metric tons, as against 57,500 in 1943. In 1945 killings were probably less than in 1944.

In 1944 the total cotton production in Brazil was more than 2,675,000 bales, or 23% of total United States production. The state of São Paulo alone produced about three times the total of the other Brazilian states.

The production of corn in 1943-44 was estimated at 200,000,000 bu. Sugar cane production in 1944 was 1,300,000 metric tons, and in 1945 it was expected to be even larger. Most of the sugar produced is sold in the domestic market and surplus is converted to alcohol. A private corporation, the Fundação Brasil Central, established to promote the economic development of central Brazil, planned to establish in 1945-46, 22 sugar centrals and 2 distilleries in Mato Grosso and Goiás. Pine exports in 1944 totalled 298,000 metric tons, as compared with 287,000 in 1943.

The coffee production in 1944 was estimated for the whole country at 9,400,000 bags of 132 lb., as against 11,800,000 in 1943, and 13,600,000 in 1942. The coffee crop for 1945 was estimated at about 14,000,000 bags.

The rice crop of 1944 was estimated at about 1,800,000 metric tons, mostly sold in the domestic market. Cacao, produced mainly in Bahia, is an important export item. The 1944-45 crop was estimated at 1,850,000 bags. In 1944 the tobacco crop was

VETERANS returning to Rio de Janeiro, Brazil, in 1945 display the swastika flag captured from a German division in Italy

estimated at 100,000 metric tons. Other important agricultural products are beans, mandioca, citric fruits, bananas, pineapples, coco-nuts, Brazil nuts, carnaúba, castor beans, babassú nuts and wheat.

The rubber production in 1945 was estimated at about 50,000 metric tons. On Dec. 26, 1945, the government issued a decree authorizing the transference to Brazil of the Ford Motor company's plantations on the Amazon river. The Brazilian government agreed to pay \$250,000 for the property in which the company invested about \$9,000,000. Brazil planned to spend some \$1,215,000 for the development of the property.

**Manufacturing.**—Although manufacturing continued to be primarily for domestic consumption, the rapid industrialization of Brazil continued in 1945. There were more than 100,000 factories of all types, employing about 1,500,000 workers who turned out more than \$1,600,000,000 worth of manufactured goods in 1943. The leading industrial products were: foodstuffs, textiles, chemicals and pharmaceutical products, metallurgical products, clothing, leather, glass and porcelain, paper and rubber articles. In the first six months of 1945, more than 253,000 tires and more than 169,000 tubes were manufactured. Plans for increased industrialization over a ten-year period (1945-55) re-

quired at least \$2,500,000,000 and possibly \$4,000,000,000, to be spent mostly in machinery and capital goods.

The government had adopted vast plans for the development of hydroelectric power in ten different areas, including the São Francisco valley, where a series of dams were to be constructed along the 1,800 mi. course of the river.

A motor plant, owned and operated by the government, initiated the manufacture of aeroplane engines in 1944, with materials received under lend-lease from the United States. A private concern announced plans to build automobiles, tractors, trucks and agricultural machinery. A large rayon factory, costing some \$18,000,000, to produce about 20,000,000 lb., was to be constructed in São Paulo state backed by Brazilian capital and operated by the Brazilian Nitro Chemical company. This factory was to begin production in 1947.

Cement production in 1944 totalled 809,900 metric tons, against a total consumption of 902,400 metric tons.

**Mineral Resources.**—There exists throughout Brazil a great variety of minerals, including manganese, iron, mica, tantalite, diamonds, quartz, rock crystal, tungsten ores, semiprecious stones, wolfram, bauxite and coal. The production of coal in 1944 was estimated at 1,860,000 metric tons, as against 2,000,000 in 1943. Petroleum was being extracted in small quantities mainly in Baía. Uranium, important in the development of atomic energy, was produced and exported to the United States in 1945. In 1943, 784,000 metric tons of iron ore, valued at 770,950,000 cruzeiros, were extracted.

The Volta Redonda steel plant, established with the aid of a loan from the U.S. Export-Import bank, is owned and operated by Companhia Siderúrgica Nacional, financed by Brazilian and U.S. capital. Actual production of steel in Volta Redonda was scheduled to begin in 1946. The capacity of this plant was expected to be 350,000 metric tons of steel ingots per year. (See also ARGENTINA.)

**Bread and Bakery Products.** During 1945 the baking industry in the United States continued its effective efforts to co-operate with governmental agencies and, despite shortages of adequate manpower, ingredients and transportation facilities, continued its high rate of production. Although accurate statistics were not available at the close of 1945, leaders in the industry computed that more than 1,000,000,000 loaves of bread were baked commercially each month. Ingredients such as sugar and shortening, which were in relatively scarce supply and of which at the end of 1945 sugar still remained on the ration list, were reduced in formulas of all bakery products in order to permit greater utilization of flour, an unrationed ingredient in relative abundance. Estimates of the retail value of all bakery products indicated that it was slightly in excess of \$2,000,000,000 for the year, more than half of which is accounted for by bread. The price of bread and other bakery products was controlled by the Office of Price Administration (OPA). Statistics of the U.S. department of labour showed that the average retail selling price of a pound of white bread during 1945 was 8.8 cents as compared with 8.7 cents in 1942. The industry employed approximately 300,000 workers.

A report on the composition of United States army bread by R. E. Meckel and G. Anderson (*Cereal Chemistry*, 22:429, 1945) showed that it more than met the minimum standards for B vitamins and iron of enriched bread. Army bread was made according to ordinary baking formulas by the army's own bakers, many of whose key men were trained in the advanced school conducted by the American Institute of Baking in Chicago, Ill.

With the termination of World War II, demand for a whiter

loaf in England brought about a revision of government requirements to permit the use of a somewhat more refined flour in baking. Considerable discussion of nutritive properties of bread took place in both England and Canada but these countries did not adopt up to the close of 1945 the vitamin and mineral enrichment program which proved successful in the United States and elsewhere. During 1945 12 additional states adopted a uniform bill for the enrichment of family flour and bakers' bread and rolls, this bill being approved by the organized milling and baking industries and sponsored by persons concerned with nutrition and public health. Thus, at the end of the year 18 states and 2 territories, having a total population of about 50,000,000 people, had compulsory enrichment legislation on their statutes. In other states, bread enrichment would be on a voluntary basis following the termination of the order of the department of agriculture's War Food administration, which went into effect in Jan. 1943, and remained in effect throughout 1945.

Much interest was developed in the commercial production of frozen bakery products which were introduced in several localities in the United States. The products are prepared by the baker who, instead of baking them in his oven, freezes them quickly and packages them. The consumer does the baking. Some products are baked first, then frozen. This method of merchandising was in its infancy in 1945 and, as William H. Cathcart pointed out (*The American Baker*, 13:68, Dec. 1945), many of the technologic phases of production remained to be ascertained. The same investigator reported some interesting observations on the application of high frequency heat in the thawing of frozen fruit and other bakery ingredients, and in the prevention of mould in bread (*The Northwestern Miller*, 223:26, July 11, 1945; *The American Baker*, 13:94, Dec. 1945). The thawing of packages of frozen peaches, used in the production of pies, can be reduced from 20 hours to about 15 minutes by electronic heating. The passing of wrapped and sliced bread through an electronic oven in five seconds destroys mould spores. The annual loss of bread owing to mould development was estimated to be more than 150,000,000 lb. (See also FLOUR AND FLOUR MILLING.)

FILMS.—*Bread; Principles of Baking* (Encyclopædia Britannica Films Inc.). (F. C. Bg.)

**Breadner, Lloyd Samuel** (1894— ), Canadian airman, was born July 14, at Carleton Place, Ont. He was educated at Ottawa. He had a distinguished record in World War I, becoming a flight sublieutenant in the royal naval air service in 1915. He later transferred to the royal air force, and by Nov. 1918 had attained the rank of major (equivalent to the present rank of squadron leader). From Oct. 1920, Air Marshal Breadner was associated with the royal Canadian air force, becoming certificate examiner to the air board. In 1922, he became director of civil aviation and had much to do with shaping civilian and commercial flying in Canada between the two world wars. From 1928 onward, however, he was drawn into military aviation, serving as acting director of the R.C.A.F. till 1932. In 1936, he became air staff officer at National Defense headquarters. In 1940, he was made air vice-marshal, and chief of air staff. He became air marshal in 1941 and on Nov. 11, 1943, was named air officer commanding the R.C.A.F. overseas. In the King's Honour List of 1943, Air Marshal Breadner was created a companion of the Order of the Bath. On March 17, 1945, he retired as air officer commander in chief of the royal Canadian air force overseas. A few days later, he was raised to the rank of air chief marshal. Before returning to Canada, the air chief marshal was received by his majesty, the king, at Buckingham palace

(April 7). In company with the other leaders of the Canadian armed forces, and of President Conant of Harvard university, Air Chief Marshal Breadner received an honorary doctorate of laws from McGill university in October. (J. I. C.)

**Brereton, Lewis Hyde** (1890— ), U.S. army officer, was born June 21 in Pittsburgh, Pa., and graduated from the naval academy at Annapolis, 1911. Two days after he was commissioned as an ensign he resigned to become a lieutenant in the army's coast artillery corps. He took flight training in 1912, served as a pilot in the Philippines and commanded one of the first U.S. flying units on the western front during World War I. In July 1941 he was made head of the army air force in the Philippines. After the loss of the Philippines, he became chief of U.S. air forces in India. Transferred to the middle east, July 1942, as U.S. air commander, in Feb. 1943 he became U.S. commander in chief of the middle east. In Aug. 1944 the Allies revealed that Brereton was given command of a new air-borne army. Brereton's force launched an air-borne invasion of the Netherlands, Sept. 17, in a daring attempt to cross the Rhine river at Arnhem. The Germans, however, prevented Allied ground forces from establishing contact with the air-borne troops, and the operation ended in failure. On March 24, 1945, about three divisions of Brereton's 1st Allied air-borne army landed behind German lines on the east bank of the Rhine. This operation, smoothly coordinated with other Allied crossings, was successful. After the end of the war in Europe, Gen. Brereton was a member of Gen. Courtney Hodges' U.S. 1st army staff.

**Bretton Woods:** see BANKING; EXCHANGE STABILIZATION FUNDS; INTERNATIONAL LAW; UNITED NATIONS MONETARY AND FINANCIAL PROGRAM.

**Brewing and Beer.** The word beer covers the entire malt beverage group—beer, ale, porter, stout, etc. Malt beverages are sold, under regulation and licence, in all 48 states of the U.S.A., which generally treat beer apart from distilled liquors because of its low alcoholic content. They are taxed by the federal and state governments.

The industry's production and sales statistics are based on U.S. internal revenue reports of tax-paid withdrawals (sales) for the fiscal years ending June 30. As cited here, the reports cover the period after beer's relegalization by the act of congress effective April 7, 1933 (which preceded the effective date of repeal of the prohibition amendment by eight months).

**Sales Records.**—Following are the sales records in U.S. barrels (31 gal.) by fiscal years ending June 30: 1933 (85 days), 6,277,728; 1934, 32,266,039; 1935, 42,228,831; 1936, 48,759,840; 1937, 55,391,960; 1938, 53,926,018; 1939, 51,816,874; 1940, 53,014,230; 1941, 52,799,181; 1942, 60,856,219; 1943, 68,636,434; 1944, 76,969,764; 1945 (official but not audited), 79,256,000.

Package sales, considered significant of the extent of home use, maintained their progressive gains in 1945 when 64.3% of all beer—a new record—was sold in bottles. There was also considerable canned beer sold for overseas shipment, but this is not included in the sales record figures, since this beer was withdrawn for consumption outside the continental limits of the U.S. In 1934, 75% of all beer was sold in barrels.

**Taxes.**—Federal excise and special taxes on beer for the fiscal year 1945 totalled \$641,811,737, bringing the cumulative total after relegalization in 1933, to \$4,114,028,796. State and local taxes and licence fees in 1945 were estimated at \$170,000,000, raising the cumulative figure after relegalization to about \$1,520,000,000. From 1933, the combined public revenues from

beer approximated \$5,635,000,000. In 1945 beer carried the heaviest tax burden in the industry's history. Its federal tax rate was \$8 a barrel, as compared with \$1 a barrel 30 years before. To this was added state taxes, nonexistent before World War I, making the combined tax rate in some instances 15 times as high as 30 years previously.

**U.S. Beer Abroad.**—The overseas army demand for beer as a moderate refreshment and an aid to morale could not be entirely fulfilled because of transportation difficulties. This made it desirable to obtain as much of the beverage as possible from nearby breweries in Europe. For this purpose, a number of Italian and North African breweries were taken over by U.S. army authorities in 1944, and placed under the supervision of expert brewers from the armed services. This was extended in 1945 to include breweries in areas liberated in France and those in the American zone of occupation in Germany. The result was the production of American type of beer in European breweries, supplemented by beer imported from the U.S. as shipping facilities permitted.

**By-Products.**—Nearly one-third, dry weight, of grains used by brewers is returned to the farm in the form of spent grains which form a concentrated protein-rich feed for livestock, particularly dairy cattle. Recovery of spent grains is estimated at nearly 60 lb. (wet weight) per barrel. On this basis, American brewers produced an estimated equivalent of 2,371,000 tons of spent wet grains during 1945. About one-third of this amount was dried for long-distance shipment.

Another valuable by-product of the brewing process is brewers' yeast, one of the richest natural sources of vitamins of the B-complex group. Under a program set up in 1942 in co-operation with the U.S. War Food administration and National Research council, the brewing industry during 1945 continued its nationwide project of processing and drying of brewers' yeast for use as a concentrated food, not only for American armed forces and war workers, and the peoples of allied and liberated nations, but also as an extremely important adjunct in the feeding of animals and poultry.

**Moderation and Law Enforcement.**—In 1938 the brewing industry launched a self-regulation program, sponsored by the United States Brewers' foundation in 16 states. Designed to promote moderation and sobriety and to maintain wholesome, orderly conditions wherever malt beverages are sold, the program utilizes trained investigators to observe the conduct of retail beer outlets and to report to law-enforcement authorities those licensees who refuse to correct law violations. An outgrowth of this activity was the brewing industry's army and navy co-operation program, initiated with the enactment of selective service in 1940 and which was continued despite the end of the war and consequent reduction of personnel and activities at most army centres. This program, endorsed by the war and navy departments, enlisted the aid of brewers, wholesalers, retailers and their associations for co-operation with military and civil authorities in the vicinity of military posts. (See also LIQUORS, ALCOHOLIC.) (C. D. Ws.)

**Bridge, Contract:** see CONTRACT BRIDGE.

**Bridges.** Plans have been made (1945) for rebuilding, on a new design, the Tacoma Narrows bridge, Tacoma, Wash., that was dramatically destroyed by aerodynamic action in 1940.

A contract was let in 1945 for \$1,300,000 for strengthening the Bronx-Whitestone bridge, New York city, N.Y. (2,300-ft. span), by adding deep trusses to the shallow stiffening girders in order to increase the resistance of the span to aerodynamic oscillations.

TROOPS of the U.S. 1st army crossing the Rhine into Germany over the Ludendorff bridge at Remagen, Germany, after its capture on March 7, 1945. Failure of the Germans to destroy the bridge gave U.S. forces a foothold on German soil, the first invasion of Germany from the west in more than a century.

A number of vertical vibration recorders were installed on the Golden Gate bridge, San Francisco, Calif. (1944), to measure and record the amplitudes and modes of the aerodynamic oscillations of the 4,200-ft. span.

The postwar plans (1945) of British engineers include two new long-span bridges, one over the Severn and one over the Firth of Forth. The proposed suspension bridge over the Severn is to have a main span of 3,200 ft., with towers 500 ft. high, representing an entry into a new order of span magnitude for British bridge building.

The Justo-Vargas International bridge connecting Brazil and Argentina over the Uruguay river, commenced in 1938, was completed and officially dedicated in Oct. 1945.

The famous Plougastel bridge across the Elorn river near Brest, France, was destroyed by the Germans in 1944. Built by E. Freyssinet in 1929 as a combination railway and highway bridge, its three 612-ft. spans jumped existing span lengths for concrete arches to a sensational extent and held the record for 11 years as the world's longest concrete arch spans, since exceeded by only two other concrete arches (Esla in Spain, and Sando in Sweden). An innovation in its construction was the installation of 28 horizontal jacks in the crown of the arch to prestress the rib and at the same time to lift it free of the centring. The bold design used an unusually high stress of 1,000 lb. per square inch in the arches, for which concrete having the unprecedented ultimate strength of 8,500 lb. per square inch was specified.

All of the bridges over the Danube at Budapest, Hungary, including the two famous chain suspension bridges (Lancz bridge, 663-ft. span, 1845, and Elizabeth bridge, 951-ft. span, 1903) were destroyed during World War II.

Bold span lengths of continuous plate-girder bridges were attained in Germany before World War II. A bridge at Mangfall (1935) had a plate-girder span of 354 ft.; a bridge crossing the Elbe (1938) on the Berlin-Halle express highway had a plate-girder span of 411 ft.; and a bridge over the Rhine at Frankenthal (1939) had a plate-girder span of 591 ft. Another bridge (unidentified) was reported to have a span of 623 ft., which would make it the longest plate-girder span in the world. And the ambitious bridge project at Hamburg, commenced in 1938 and interrupted by the war in 1939, included a proposed continuous plate-girder span of 854 ft.

Over the Albert canal in Belgium, more Vierendeel rigid-joint

truss bridges, both riveted and welded, were built between 1930 and 1940 than existed in all the rest of the world combined. All were destroyed, mostly by the Belgians themselves, in 1940. At Liège a Vierendeel bridge not yet erected was found and utilized by U.S. army engineers to build a temporary crossing and was subsequently completed (1945), becoming the only surviving example of this interesting bridge type over the Albert canal.

A bridge at Hasselt, Belgium, which collapsed due to weld failure in 1938, was rebuilt 14 times in the changing fortunes of war.

A unique aerial transporter bridge was constructed 1944-45 over the Espiritu Santo river (one of the tributaries of the upper Amazon) in Bolivia. The need for natural rubber made this crossing vital. The transporter car, suspended from the cable tramway, carries a six-ton loaded truck across the 885-ft. span in 1½ minutes, yet requires only a 20-hp. motor. The track cables are kept horizontal by being supported at intermediate points from the overhead supporting cables; in addition, self-balancing counterweight anchorages and spring-loaded compensating ropes help still more to prevent sag at the load concentrations. The complete transporter bridge was fabricated in the United States and carried by mule and canoe far into the Bolivian jungles where it was erected in eight weeks by unskilled local workers.

A concrete pontoon bridge completed in 1944 across the Derwent river at Hobart, Tasmania, is novel in design, forming a three-hinged horizontal arch, with the crown of the arch upstream. The arching in plan dispenses with cable anchorages. The entire 3,165-ft. length of the floating arch moves freely up and down with the 8-ft. tides. Each of the two arch segments consists of 12 cellular pontoons, 132 ft. long, rigidly united by welding the projecting reinforcement and then concreting. The 40-ft. width includes a 30-ft. roadway, a sidewalk and space for a water main. A vertical lift span in the approach provides a clear channel 180 ft. wide and 150 ft. high for navigation. In 1943, before final completion, a severe storm built up heavy seas which battered and damaged the structure. The period of the waves matched the natural period of vibration of the bridge in a horizontal plane; this resonance caused excessive amplitudes and resultant stresses. The structure was repaired and strengthened, and timber breakwaters were built for protection from wave action. Built as a toll bridge at a cost of \$1,100,000, the structure was acquired from the private owners by the government of Tasmania in 1944.

A novel and ingenious bridge type, developed to meet a wartime need, is a four-lane retracting pontoon bridge built in 1944-45 to carry a four-lane highway across Cerritos channel in Long Beach harbour, Calif. With structural steel at that time a highly critical material, a solution of the problem was found in a design using two retractable, concrete pontoons arranged to slide back under the approach ramp on either shore. This arrangement required very little steel, eliminated heavy foundation work, and left the channel entirely unobstructed when the pontoons were retracted. The clear span between fenders is 170 ft. With a 40-hp. motor for each pontoon the bridge can be opened or closed in 1½ minutes. The two concrete pontoons, 50 ft. by 132 ft. in plan and weighing 1,200 tons each, were cast in dry excavations on shore, which were then flooded and the pontoons floated out. The pontoons were designed as cellular structures for strength, also to provide a central section that can be used as a ballast tank for decreasing freeboard to reduce wave exposure and to adjust clearance in the retracted position.

European engineers recorded outstanding pioneer work in the development of prestressed concrete. To replace bridges destroyed in France during World War II, Freyssinet built a number of prestressed concrete beam spans of 164 ft. with girders 6½ ft. deep. In 1942 Freyssinet built a prestressed-concrete girder bridge over the Seine with a record-breaking span exceeding 100 metres (328 ft.) and a girder depth of only 8 ft.

Fortunately no war damage occurred to any of the two dozen beautiful and famous bridges crossing the Seine within the city of Paris, but bombs and demolition took their tolls of nearly all of the bridges outside of Paris. About 5,000 bridges in France were wrecked, many of them a second time after reconstruction in 1943.

The new bridge (built 1945) over the Seine at Neuilly has an arch span of 269 ft., the longest welded arch span in the world. Each arch contains 12 two-hinged, welded box-section ribs built up of high-strength chrome-copper steel plates. The bridge replaces Perronet's famous stone arch built 1768-1780.

Forming part of a projected superhighway, the new bridge over the Seine at St. Cloud, built early in the war, consists of five 100-ft. continuous girder spans, also of welded construction and also using chrome-copper steel. It replaces a 16th century bridge of ten arch spans that had been destroyed by floods and wars and rebuilt countless times. In the new bridge a distinctive appearance was secured by the use of copper sheets enclosing the exterior girders and the use of exposed varicoloured aggregates in all concrete surfaces of piers, abutments and retaining walls.

The Suresnes bridge over the Seine, commenced in 1937 but interrupted in 1942, was to be a concrete cantilever of 259-ft. span with 130-ft. anchor spans. The welded structural steel reinforcement (2,200 tons) was erected first so as to provide a support for the concrete forms.

Replacing a bridge of seven cast-iron arches, wrecked by the French army engineers in 1940, the new bridge over the Seine at Bezons was to be a concrete arch of 310-ft. main span with 180-ft. cantilever side spans, requiring special erection procedures.

The Seine crossing at Bry-sur-Marne, of unusual type and span, a concrete cantilever of 186-ft. span, completed in 1938 and wrecked by the French army engineers in 1940, was replaced by a temporary suspension bridge in 1941. Rebuilding of the original bridge was commenced in 1945, involving the raising of the suspended section of the main span from the bottom of the river.

In the 120-mi. stretch of the lower Seine below Paris, where few bridges remained standing, France would be able to carry out its long-planned program of bridge replacement with longer spans where the piers of the old short-span bridges cramped the channel, aggravating floods and blocking navigation.

The prestressing principle was used in a highway bridge built in Aue, Ger., in 1936, using a reinforced concrete cantilever girder 392 ft. long, with a centre span of 226 ft. A novel feature in this structure was that the adjustable steel tension chord, used to prestress the girders, was not embedded in the concrete.

A bold extension of the same principle was applied in the design for a self-anchored suspension bridge, 3,100 ft. long with 2,000-ft. main span, proposed in 1940 for a crossing over the harbour of Rouen at Tancarville, France. In this design the suspended structure is of reinforced concrete, precast in 100-ft. sections, each section being connected to the towers by adjustable steel diagonals which provide the prestressing as well as the suspension. This system facilitates cantilever erection, and the usual parabolic cables may be either omitted or added later.

The pioneer application of structural aluminum as a bridge material was for the replacement (1933) of the suspended floor (including floor-beams, stringers, roadway and sidewalks) of the two 360-ft. lenticular truss spans of the 50-year-old Smithfield Street bridge over the Monongahela river at Pittsburgh. This reconstruction reduced the dead weight of the structure by 800 tons, thereby increasing the live-load capacity by that amount and prolonging the usefulness of the old bridge to carry modern loading. After 12 years of service the experiment was pronounced fully successful in a report (1945) by the U.S. Public Roads administration.

A bridge constructed entirely of structural aluminum (a plate-girder span) was to be built in 1946 at Massena, N.Y.

The \$2,250,000 President Harry S. Truman bridge, carrying a single track railroad across the Missouri river on the outskirts of Kansas City, Mo., was officially opened to trains in May 1945. The bridge, designed for E-72 loading, includes a 420-ft. vertical lift span weighing 1,600 tons.

The new Pecos River viaduct, carrying the Southern Pacific railroad across the deep gorge of the Pecos river in Texas, just north of the Mexican border, was commenced in 1943 under an emergency wartime priority and was completed in Dec. 1944. It parallels and replaces the original Pecos River viaduct, built in 1891, long famous as the world's highest railway viaduct (320 ft. high). The new structure, carried on two hollow concrete piers, one 275 ft. high, is a continuous cantilever deck truss with a main span of 374½ ft. The trusses were erected as cantilevers, but the joints were then riveted to make the spans continuous under live load. The location is a centre of earthquake shocks, so that earthquake forces had to be considered in the design.

A new bridge (built 1944) for the Southern Pacific railroad over the Pajaro river in California crosses the San Andreas fault and was designed with novel earthquake-resistant features. The main structure is a three-span continuous deck girder 364 ft. long. Projections built on the pier tops are to prevent the spans from falling off the piers in case severe temblors occur, and automatic block signals to stop trains are set by any serious track disalignment.

A new double-track bridge spanning the Colorado river near Topock, Ariz., built by the Atchison, Topeka and Santa Fe railway (1942-45), is designed for E-72 loading and is 1,507 ft. long, including three 350-ft. deck truss spans. The new bridge parallels and replaces the Santa Fe's old Red Rock cantilever bridge of 660-ft. span, which made bridge history as the largest cantilever span at the time it was built (1890). In 1901 the old bridge required strengthening, and in 1910 a concrete pier was built under the middle of the span to reduce the stresses. After 1931 more frequent repairs and strengthening were necessary; engine weights had to be limited and train speeds restricted to 10 mi. per hour.

In building the 1,265 mile pipeline, 24-in. diameter, to carry Texas gas to Pittsburgh furnaces (1943-44), suspension type aerial crossings were used to carry the line across the Colorado, Brazos, Sabine, Red, Buffalo and Dix rivers, with spans varying from 560 to 1,280 ft. The pipe is suspended from two overhead cables over high towers and is held in line by two side or sway cables in the same horizontal plane. The Red river crossing has a main span of 1,280 ft. with one loaded side span 640 ft. long.

After four years of interruption by World War II, construction was resumed early in 1946 on the North State Street bridge over the Chicago river in Chicago. The design is a double-leaf trunnion bascule bridge of 210-ft. clear span, with over-all width of 108 ft. The new span would be the fifth bridge in this location in 80 years.

The Darien River bridge on the Coastal highway in Georgia, completed early in 1945, is a three-span plate-girder cantilever, with a central span of 150 ft.

The longest continuous girder bridge of reinforced concrete in Georgia was built over the Chattahoochee river near Atlanta in 1944. The critical shortage of steel at the time caused the bridge to be designed in concrete, using a continuous girder structure of 65-90-65-ft. span.

To carry a four-lane divided highway over the Big Piney river in southern Missouri, a pair of identical twin bridges of reinforced concrete was completed early in 1945. Each bridge includes three open-spandrel arches of 100-160-100-ft. span.

To meet wartime needs, construction of the \$14,000,000 Terminal Island bridge and access highways to U.S. navy installations in Long Beach harbour, Calif., was commenced in 1945. The first unit includes a lift span and a mile of approaches.

In 1945 three 306-ft. spans of a bridge over the Tennessee river were moved upstream 78 mi. to a new location near Camden, Tenn. Abandoned by the Illinois Central railroad when its line was changed by the construction of the Kentucky dam, the bridge was moved to serve another railroad across the same river. The spans were raised by hydraulic jacks, lowered to barges, and then taken endwise through the lock at Kentucky dam to the new location, where piers were built before the reservoir filled.

The continuing demand for steel for war purposes caused a sharp progressive drop in the number of bridges built in the United States during the war. Expenditures for bridge construction showed a 50% drop each year, from a high of \$112,000,000 in 1941 to a low of \$16,000,000 in 1944. Many bridge shops concentrated on the fabrication of military invasion bridges including Bailey bridges and other, more secret, types of military bridges. Nation-wide surveys in 1944 indicated the immediate need for more than \$1,000,000,000 of new bridge construction in the United States.

During World War II the U.S. army developed the portable scissors

bridge as a mobile self-launching bridge, providing a rapid means of spanning small streams with an 80-ft. span for vehicles and tanks weighing up to 35 tons. The bridge is a 13-ton aluminum girder assembly hinged at the centre to fold in half. It is carried in folded horizontal position on a trailer, from which it is mechanically launched by first raising the assembly to a vertical position and then spreading the scissors until the far end rests on the opposite shore. The 80-ft. span can be installed in 15 to 30 minutes by six men.

Under security blackout during the war, U.S. bridge designers developed the demountable V-type bridge for the speedy replacement of demolished railroad bridges at the battlefield. It can be quickly erected either as a deck or a through structure, either square-ended or skewed, of 40-ft. to 90-ft. span for railroad equipment (single track, E-40 loading) and of 240-ft. span for highway use (two lanes, H-20 loading). When erected as a deck truss it has two top chords but only one bottom chord. The entire bridge contains only one type of joint, one type of angle, and one type of plate. It is designed for mass production, needs a minimum of shipping space, and can be easily assembled by combat troops without bridge experience. A standard 10-ft. panel length is used, and all the joints can be bolted simultaneously for speedy erection.

The latest development in floating bridges by U.S. army engineers during the war was the M4 or Division Army bridge, made of structural aluminum and designed for vehicle loads up to 50 tons, a greater load capacity than any previous floating bridge. It is extremely simple in that the balk, or longitudinal supporting members, also form the roadway. The balk sections, 15 ft. long, are aluminum alloy box sections, and are normally carried by two-section aluminum pontoons. For light traffic crossings, the balk sections are used as both pontoons and treadways.

For pneumatic pontoons, the M2 treadway bridge is the heaviest yet designed, good for vehicle loads up to 45 tons. The light open-grid treadways, 45½ in. wide, are supported on steel saddles on pneumatic pontoons spaced 12 ft. on centres and consisting of rubberized canvas tubes made up into a unit 8 ft. wide by 33 ft. long.

To carry the Ledo road across the Irrawaddy, during the Allied push into Burma in 1944, U.S. army engineers built a pontoon bridge of record length, 1,200 ft. within the short time of 14 hours and 45 minutes. The bridge was anchored against the current by a horizontal parabolic cable strung upstream.

The longest single-span military bridge in existence was built in 1945 by U.S. army engineers across the Shweli river on the Stilwell (Ledo) highway near the China-Burma border. It is a suspension bridge of 420-ft. main span, without side spans, and of 40-ton capacity. The towers and suspended span were assembled entirely of standard 5-ft. by 10-ft. Bailey bridge panels. The cables and suspenders are of 0.83-in. prestressed wire rope; each cable consists of six of these ropes side by side. The towers, 55 ft. high, are of rocker type. The anchorages are buried Bailey panels to which the wire ropes are connected by special quick-acting clamps, permitting easy adjustment of cable length without cutting. This type of military suspension bridge has been standardized. From the standard equipment, an engineer company can quickly build bridges of any span from 220 ft. to 420 ft. in 20-ft. increments. Half of the span is assembled complete on each bank and manually rolled through the towers, the ends being supported by tackle from carriages on the cables.

Up to the end of Jan. 1945, U.S. army engineers had rehabilitated 7,000 mi. of vital European railroads to provide the Allied armies with supply routes to the western front. This included the reconstruction of 172 major railroad bridges destroyed by bombing or enemy demolition. Unit construction railroad trusses were used, designed for rapid assembly and erection. Although built for temporary military needs, the reconstructed lines and bridges could be used for years until permanent post-war reconstruction would be undertaken.

The unit construction railway truss, developed by the British early in the war, is a precision-built Pratt-type truss that can be quickly erected as a through or deck bridge in span lengths up to 85 ft.

A spectacular Bailey bridge was built by a combat battalion of the U.S. 9th army, in Dec. 1944, to span the Albert canal in Belgium at a point where it runs through a deep wide cut. The unusual feature of the bridge was the use of 5-ft. x 10-ft. Bailey truss panels to form the 52-ft. high piers as well as the superstructure, but the bridge was also notable for its span lengths, 151-152-121 ft. The builders, without previous experience, completed the bridge in 24 hours. A bulldozer was used in pushing the assembled span out over the edge of the bank until the assembly "nose" was over the successive piers.

Preceding the Rhine offensive early in 1945, the most dangerous bridging operations were the first crossings of the Roer and other rivers with light pontoons and heavy treadway pontoons, placed by combat battalions under enemy fire. They were the kind of bridge that could be statistically catalogued as requiring so many engineers' lives per foot of crossing.

A bridge that made military history, speeding the end of World War II, was the Ludendorff bridge over the Rhine at Remagen. Built in 1916-18 during World War I, it was a railroad bridge of 512-ft. main span in the form of a tied arch continuous with 277-ft. side spans. On March 8, 1945, advance patrols of the U.S. army found it still standing, although damaged, when all other bridges over the Rhine had already been demolished; and its quick capture, only ten minutes before the time set for its planned demolition by the Germans, enabled armoured troops and supplies to be poured across the Rhine in a steady stream for ten days without the delay of building a military crossing under enemy fire. U.S. army engineers worked feverishly to save the bridge by repairing its shattered steelwork, and would have succeeded if it had been able to hold itself up another ten hours. But weakened by continued artillery blasts and by German shells, the bridge collapsed on March 17, hurling 200 engineers into the river. It had functioned long enough, however, to enable the Allied forces to get the floating bridges across and to secure the bridgehead. This unexpected crossing of the Rhine shattered the morale of the Germans and accelerated their early surrender.

For the invasion of Germany in 1945, U.S. army engineers built 14 fixed bridges across the Rhine. Characterized as semipermanent, they are of deck-girder or military-truss type supported on framed pile bents. Five of them are railroad bridges—at Wesel, Duisburg, Mainz, Ludwigs-

haven and Karlsruhe. The other nine provide highway crossings of the Rhine—at Wesel, Cologne, Neuwied, Mainz, Oppenheim, Gernsheim, Frankenthal and Ludwigshafen. In addition there were at one time more than three dozen floating bridges—treadways, heavy pontoon, Bailey pontoon, and Bailey trusses on Rhine river barges—spanning the river along the then-occupied U.S. sector, and some of these floating bridges have remained in service (1946). All of the German bridges over the Rhine had been demolished.

The railroad bridge over the Rhine at Mainz, dedicated (1945) as the Franklin D. Roosevelt Memorial bridge, 2,200 ft. long, was built in 9 days and 22 hours, breaking the record for Rhine river crossings, including that of Julius Caesar who recorded that he had done it in ten days 2,000 years ago.

The record was again broken when another regiment of U.S. engineers built the 2,800-ft. railroad crossing over the Rhine at Duisburg in 6 days and 15 hours (April 1945). Prefabricated metre-beam spans (28 spans of 75 ft. and one 90-ft. span) were set on the 30 piers by a floating derrick. Eighteen of the piers were built of hollow steel piles captured from the Germans.

When the U.S. army engineers were bridging the Rhine in the spring of 1945 for the invasion of Germany, the river was clogged with the wreckage of many world-famous bridges. These included the Hohenzollern bridge at Cologne (actually three parallel bridges, two railway and one highway) with arch spans of 390-544-422 ft., built 1911; the South bridge at Cologne, a railroad bridge of three tied arches, 333-540-333 ft., built 1911; the handsome Cologne-Deutz self-anchored suspension bridge, 605-ft. main span and 302-ft. side spans, with nickel-steel stiffening girders and plate link chains, built 1913-15; the Dusseldorf-Neuss highway bridge, a 676-ft. span cantilever completed 1929; the Dusseldorf-Hamm railroad crossing, consisting of two parallel bridges each of four 352-ft. tied arches, built 1912; the Duisburg-Homberg highway crossing, which was the largest cantilever bridge in Germany, with span lengths of 296-405-678-427-279 ft. and 54 ft. wide, completed in 1907; the Duisburg-Hochfeld highway bridge, a cantilever bridge of unusual design, built 1926, with two main spans 620 and 413 ft. long and 65 ft. deep that cantilevered one panel beyond their end supports to be continuous with 341-ft. end spans, which were only 32 ft. deep; and the Adolf Hitler bridge at Krefeld-Uerdingen, which combined cantilever and suspension action, with a main span of 820 ft., built 1935.

The Carquinez Strait bridge in California (the longest cantilever bridge in the United States), also the nearby Antioch bridge, both built in 1923, became toll free in 1945. The two bridges were purchased by the state toll bridge authority in 1940 for \$5,500,000; their gross toll revenue amounted to \$1,500,000 annually.

In 1944 the Gandy bridge, between Tampa and St. Petersburg, Fla., was taken from its private owners by order of the secretary of the navy as an aid to the war effort, and was made toll free. By subsequent court decision, the federal government paid the owners \$2,382,000 for the bridge.

Nine out of a total of 12 state-owned toll bridges in Kentucky, including some over the Ohio river, became toll free in 1945.

South Carolina's last toll bridge, the 2,650-ft. John P. Grace Memorial bridge over the Cooper river at Charleston, completed 1929, was to become free of tolls in July, 1946.

In 1945 there were more than 400 old covered bridges still surviving in the United States, and many of these were in service.

The historic covered bridge at Bowling Green, Ind., built in 1854 and once saved from demolition by an eloquent appeal of the Indiana Historical society, finally succumbed to the elements and collapsed in 1945. Some years earlier the span was officially closed as unsafe, but the local farmers promptly ripped the barricades down.

The 104-year-old covered bridge at Newfane, Vt., was dismantled in 1945 to make way for the construction of a new state highway span. Local citizens formed the 1841 Covered Bridge association to re-erect the historic timber bridge at a new site.

The 55-year-old timber bridge at Franklin Junction, N.H., one of the few remaining covered railroad bridges in the United States, collapsed because of the undermining of an abutment by a 1945 flood. The hand-hewn oak structure of 200-ft. span carried a single-track railroad until 1936, when weakened footings caused the bridge to be abandoned. (See also ROADS AND HIGHWAYS.) (D. B. S.)

**Briquettes, Fuel:** see FUEL BRIQUETTES.

**British Borneo:** see BORNEO.

**British Columbia.** The crown colonies of Vancouver Island (1849) and of British Columbia (1858), after uniting in 1866, joined the Canadian confederation on July 20, 1871, to form the most westerly province of the Dominion of Canada. Bordering on the Pacific ocean, the province occupies an area of 366,255 sq.mi., of which 6,976 sq.mi. are water. The total population, as of June 1, 1945, was estimated to be 949,000. The principal ports of Vancouver (275,353 in 1941), New Westminster (21,967) and Victoria (44,068) lie in the southwestern corner—not far from the United States border. At the 1941 census, urban dwellers numbered 443,394, and rural dwellers 374,467; the bulk of the population (558,085) was reported to be of English, Irish or Scottish descent; native Indians numbered 24,875, and persons of Asiatic descent, 42,472. Wartime immigration from neighbouring provinces increased the population of the coastal cities; based on the

distribution of ration books in 1943, the population was: Greater Victoria, the capital, 82,390 (including Oak Bay, Saanich and Esquimalt municipalities); Greater New Westminster, 36,778; Vancouver, 306,167; Prince Rupert, 11,926.

**History.**—In the fourth session of the 20th parliament, which occurred during February and March, 1945, John Hart, premier and minister of finance, reported to the legislative assembly that the revenue of \$38,760,635, collected during the fiscal year ended March 31, 1944, was \$1,196,717 less than the total revenue collected in the preceding year (\$1 Canadian=90.9 cents U.S.); that the net public debt on Dec. 1, 1944, amounted to \$132,418,832, which represented a decrease of \$1,262,030 from 1943; that the anticipated revenues were \$37,267,713 and expenditures \$37,198,960 in the fiscal year 1945-46. Measures passed by the assembly included provision for a \$5,000,000 building program at the University of British Columbia; an arrangement for the purchase of land-clearing machinery and its rental to farmers; financial assistance to accredited districts for the irrigation of land; provincial guarantees to assist village municipalities to finance self-liquidating water and sewage works; the Electric Power act, which created the British Columbia Power commission and authorized the government to lend the commission up to \$10,000,000 for the acquisition and operation of power plants, and provided for the wholesale distribution of power.

In August the development of northern areas and future of the provincially owned Pacific Great Eastern Railway was referred for study, by Premier Hart, to a joint committee comprised of Dominion, British Columbia, Alberta, Canadian Pacific and Canadian National Railways representatives.

In the October provincial election, the Coalition government, headed by Premier John Hart (Liberal) and Attorney-General R. L. Maitland (Conservative), was returned to office. The Co-operative Commonwealth federation, headed by Harold E. Winch, again became the official opposition. Standing of the various parties in the new legislative assembly was: Coalition members, 37; C.C.F., 10; and Labour, 1. Other members of the provincial executive council and their portfolios, at the close of the year were: G. S. Pearson, provincial secretary and labour; H. Anscomb, public works, railways and municipal affairs; E. C. Carson, mines and trade and industry; E. T. Kenney, lands and forests; Dr. G. M. Weir, education; F. Putnam—who succeeded Dr. K. C. MacDonald, deceased—agriculture.

In November, at the meeting of the co-ordinating committee, comprised of federal ministers and provincial premiers, Premier Hart indicated that the provincial government endorsed the full employment objectives advanced by the Dominion at the Dominion-Provincial conference in August; that the province would consent to Dominion administration of the income and inheritance tax fields, if satisfactory financial arrangements could be devised, but that the Dominion's financial proposals, as presented in August, were not adequate. In the same month the report of Dr. M. A. Cameron, sole commissioner inquiring into the cost of education, was made public. In recommending that the system of local school boards be retained, the commissioner advocated reformed school districts, equalized assessments and a basic provincial program—to be financed in part by increased provincial grants-in-aid and a uniform tax of 5 mills upon property. In December, H. Carl Goldenberg was appointed sole member of a royal commission to study provincial-municipal financial relations; the hearings were to begin in Feb. 1946.

**Education.**—During the school year ending June 30, 1944, 119,043 students were enrolled: in the elementary (80,034), junior high (15,998), superior (3,688) and high (19,323) schools of the province. Teaching staffs comprised 2,621 teachers in

elementary, 509 in the junior high and 1,032 teachers in superior and high schools.

**Communications.**—Provincial highways were maintained approximately at their 1942 level; the total mileage in 1942—excluding the Alaska highway—amounted to 21,726 mi., of which 9,131 mi. were surfaced; 10,069 mi. were improved earth; 2,526 mi. were unimproved earth roads. Contracts calling for the completion by 1947 of a 251-mi. road between Dawson creek on the Alaska highway and Prince George were awarded in July. Little change occurred in the railway mileage, which amounted to 3,849 mi. of single track in 1942. In the same year, the total number of telephones, 162,518, included 56,795 on automatic switchboards.

**Manufacturing, Agriculture, Mineral Production.**—Preliminary provincial estimates indicated that the net value of production in the primary industries, during 1945, slightly exceeded that of the previous year; the details were: \$100,000,000 in agriculture (1944, \$97,738,000); \$39,500,000 in fisheries

(1944, \$34,900,990); \$150,000,000 in forestry (1944, \$146,611,000); and \$54,500,000 in mining (1944, \$54,923,803). Building activity was reported to have reached its highest point in 15 years. But, reflecting the influence of slackened war activity in the manufacturing industries, and heightened by an influx of demobilized personnel, during the last quarter of the year applications for unemployment insurance benefits reached new high levels in the coast cities.

**British East Africa.** Under this heading are grouped British colonial territories on the east coast of Africa, of which certain essential statistics are given in the table. See BRITISH EMPIRE for population, capital towns, status and governors. (See also RHODESIA.)

Common plans for demobilization were discussed throughout 1945, notably by a conference of East African governors in May, whose findings were published for the first time. The plans included an ordered demobilization by groups through district commissioners, considerable new training facilities, mainly located in Kenya, and some measure of after-care, through a new African branch of the British legion. General postwar development schemes had received, to March 31, £3,500,000 from the colonial development and welfare fund. To June 30, 1944, there were £24,827,962 circulating compared with £6,499,776 in 1939. New regional organizations included

an interterritorial civil directorate of demobilization, and an interterritorial transport conference. Powers were sought for an electric power line from Tanganyika to Kenka. On Dec. 12 an economic high commission was announced for the four territories.

**Kenya.**—On July 25, 1945, the legislative council passed a scheme for a functional redevelopment of the central government, under which five posts were created on the executive council: native affairs; finance; law and order; development and reconstruction; and agriculture, animal husbandry and natural resources. The chief secretary's office was abolished, and he became development member and also chairman of a new development authority. The reform was opposed by Indian members, but supported by the African, who required safeguards about African representation and security of tenure. In July, at one of the *barazas* he was holding throughout the native areas, the governor promised greater representation, a closer organization of African local government, and a new cadre of African administrative assistants. These administrative reforms were to be read in conjunction with new development plans, involving £18,000,000, proposed by a development committee, and providing for accurate statistics, control of water supplies and soil erosion, African resettlement, bulk selling of produce, and a new doctrine for African land tenure as tenants of the tribe.

**Mauritius.**—A disastrous year included two destructive cyclones, and the world's greatest outbreak of infantile paralysis in which more than 1,000 people died—both during the spring of 1945. On the other hand, plans were on foot for a new and more democratic constitution, with a wider franchise, and a British trade union expert visited the island to advise on labour reforms. A modern hospital and rehabilitation centre was inaugurated with space for 300 patients at Floreal in the centre of the island.

**Tanganyika.**—The new governor in his first speech in May 1945 looked forward to intensive development. Published plans included: a scheme to build 3,000 mi. of road; an agricultural development fund to be set up from the £300,000 profits from cotton and coffee control; a pioneer cottonseed oil mill at

Dar-es-Salaam, and experiments in spraying the new insecticide DDT from low-flying aircraft. A mining consultant was also being sought. There were considerable diamond finds reported from Shinyanga. On welfare, £50,000 came from London for a system of community centres. A scheme for graduated income tax in the Pare district failed after a two-year trial. In November the legislative council was modified to include more unofficials, including two Africans.

**Uganda.**—Widespread riots broke out in Jan. 1945 in Buganda, during which eight Africans were killed. Although the trouble was ostensibly caused by the high cost of living, an official inquiry revealed in June that the main reason was an attempt by younger Nationalist elements to gain control of affairs, against the young Kabaka and an efficient but unpopular finance minister. On Sept. 5 a new prime minister was assassinated. His successor was a son of Sir Apolo Kagwa. Meanwhile the Kabaka decided to go to England for two years' study at Cambridge university. Reforms included the appointment of three Africans as members of the legislative council, held at Kampala rather than Entebbe; an appeal for greater democratic representation in the native government of Buganda; and greater concentration on development work for which £1,300,000 had come from London, half for a new hospital at Mulago. Other development plans included a drive against the tsetse fly, and £300,000 to be spent on technical training centres for 4,000 returned soldiers, who brought back £1,000,000 in pay.

**Zanzibar.**—Development plans included two new hospitals, a town centre, drainage schemes, a stock farm, and better educational facilities, particularly for girls. A social and economic survey was also provided for. £100,000 had come from London toward this program.

(H. V. L. S.)

**British Empire.** The governments of the British empire and the governors and premiers were as follows as of Dec. 31, 1945 (for British empire territories under military occupation during 1945 other than those indicated in the table, *see* WORLD WAR II and articles under individual territorial headings):

## British Empire

	Country	Area sq. miles (approx.)	Popu- lation (000's omitted) (est. Dec. 1939)	Capital	Status	Governors and Premiers
Europe						
Great Britain and Northern Ireland . . . . .		93,991	48,182*	London	Kingdom	George VI, King-Emperor. Prime Minister of Great Britain: C. R. Attlee. Governor of Northern Ireland. Vice-Adm. Lord Granville. Prime Minister of Northern Ire- land: Capt. Sir Basil Brooke.
Channel Islands . . . . .		75	96	{ St. Helier St. Peter Port	Part of kingdom of Great Britain and N. Ireland	Jersey: Maj. Gen. F. G. Hyland. Guernsey: Maj. Gen. Philip Neame.
Eire . . . . .		26,601	2,951§	Dublin	Dominion	President: S. T. O'Kelly. Prime Minister: Eamon de Valera.

§Pop. est. 1943.

**British Guiana.** A British crown colony in northeastern South America. Area, 89,480 sq.mi.; pop. (1931 census), 310,933; pop. est. (1943), 364,694. Racial groups in the population include 159,249 East Indians, 135,364 Negroes, 9,419 aborigines, 8,361 Portuguese and 3,557 Chinese (1943 est.). The latest birth and death rates available in 1945 were 35.3 and 20.4, respectively, per thousand. Agriculture claims 28% of the population. The capital and principal city is Georgetown (1943 pop. est., 73,171, of whom only about 1,400 were white). The only other important town is New Amsterdam (pop. 10,525). Governor and commander-in-chief in 1945: Sir Gordon James Lethem.

**History.**—The colony was chiefly concerned in 1945 with economic reconversion. The government inaugurated elaborate plans to promote the rice industry and also to encourage fishing. Interest continued in a plan to irrigate the whole coastal belt of 270 mi. at a cost of \$12,000,000<sup>1</sup> over a 20-year period.

**Education and Religion.**—The government in 1943 operated 189 schools (plus 59 in remote areas) with 60,021 pupils; 1,620 teachers, and an average daily attendance of 44,552; the government grant for education was £140,584. Of children of school age, 97% were on the registers. Illiteracy was estimated at 30%. The principal churches are the Anglican and Roman Catholic.

**Finance.**—The British Guiana dollar is tied to the pound sterling at 4s.2d. (1945 value: \$0.83404 U.S.). Quotations of government finances are variously quoted in B.G. dollars and sterling. Estimated revenues in 1944 were £1,968,347 (1943: £2,600,717); estimated expenditures were £2,144,293 (1943: £2,288,802). On Jan. 1, 1944, the public debt was £4,038,603 and the treasury surplus was £1,242,780. Customary chief items of revenues are tariffs, excises and licences, internal revenues and income taxes; principal expenditures are usually for debt servicing, public works, medical services, education and police. Total proposed government subsidies for 1945 were \$1,931,925 (1944: \$1,642,668); the program was adopted as a wartime measure to control living costs.

**Trade.**—Exports in the first quarter of 1945 were valued at \$5,468,100 (last quarter of 1944: \$6,257,724) and imports at \$4,920,879. Customary chief export items are sugar, rice, bauxite, gold, rum and balata; principal import items are usually machinery, flour and wheat, textiles, manufactured fertilizers and wearing apparel. Shipments of rum, shingles and timber fell in the first quarter of 1945 as against the last quarter of 1944 but rice exports rose slightly. Molasses exports in the first quarter of 1945 were 44,750 imperial gal. (1944: 1,664,421 gal.). Exports of round and hewn timber in the third quarter of 1945 were 40,882 cu.ft. valued at \$44,066 (second quarter of 1945: 80,984 cu.ft. valued at \$90,539); exports of sawed lumber in the third quarter of 1945 were 24,375 cu.ft. valued at \$39,042 (second quarter of 1945: 22,545 cu.ft. valued at \$36,296). Gold exports in the third quarter of 1945 were 2,348.7 oz. valued at \$77,679, all of which went to the U.S. Bauxite exports in the same period were 236,350 long tons val-

ued at \$1,138,583; 227,910 tons of the bauxite went to Canada, the rest to the United Kingdom. Diamond exports in the same period were 3,899.5 carats (of which 2,896.6 carats went to the U.K.) valued at \$119,586. Butter imports in the first half of 1945 were 133,449 lb. valued at \$64,590 (1944: 494,439 lb.) and cheese imports in the same period were 98,270 lb. valued at \$38,216 (1944: 200,768 lb.). Machinery imports dropped greatly in the first quarter of 1945 as against 1944 but in the second quarter of 1945 they increased more than 100% over the first quarter. Imports of boots and shoes in the first seven months of 1945 totalled 7,754 doz. pairs valued at \$246,865 as against 25,522 doz. pairs valued at \$812,755 in the same period in 1944.

**Communication.**—Steamship connections operate to Great Britain, the U.S., the Canal Zone and Venezuela. Pan American Airways operates a weekly service between Miami and Georgetown. Railway mileage is 110 and highway mileage 500 in automobile roads and 177 in forest roads. The government was planning an extensive road-building program in the interior. Post offices Jan. 1, 1945, numbered 107, of which 54 were telegraph and radio stations; telegraph lines totalled 415 mi. Telephones on Jan. 1, 1945, numbered 2,800.

**Production.**—Sugar is the main crop; more than half the population is estimated to depend on it. Production in 1943 was 131,186 long tons valued at \$7,519,067. British Guiana is the chief rice producing region of South America; 72,000 acres (of a total of only 155,000 acres of cultivated land in the colony) are devoted to it. With government encouragement, farmers in 1945 began paying more attention to seed selection, planting, irrigation and drainage, with the result of a gradually increasing yield per acre. The legislative council in 1945 appropriated \$996,240 for improvement of the rice industry. Coconut production is estimated at 40,000,000 nuts annually. Coffee production fluctuates widely. Other agricultural and forest products include fruits, maize, rubber and woods (chiefly greenheart, mora and crabwood). Mineral production consists entirely of bauxite, gold and diamonds, though others, including platinum, silver, copper, manganese, mica and lignite were thought to exist. Copra production in 1944 was 2,586 long tons; the output dropped early in 1945. Cigarette production in 1944 was estimated at 210,000,000. A livestock census in 1942 showed 157,712 cattle, 3,726 horses, 13,190 goats, 47,550 sheep and 25,180 hogs. (See also WEST INDIES, BRITISH.)

**BIBLIOGRAPHY.**—*West Indies Year Book* (1944); *South American Handbook* (1945); E. Fitz-Moore, *A Modern Geography of British Guiana* (1944); *Canada-West Indies Magazine* (Montreal, monthly); *Crown Colonist* (London, monthly).

**FILMS.**—*Colombia and Venezuela* (Encyclopædia Britannica Films Inc.). (R. H. FN.)

**British Honduras.** A British crown colony on the Caribbean side of Central America, bounded on the north by the Yucatan peninsula, on the east and south by the Caribbean sea, on the west by Guatemala. Area: 8,867 sq.mi.; the southern part of the colony was technically in dispute with Guatemala, however, because of alleged British non-fulfilment of provisions in a boundary treaty in 1859. Pop.

<sup>1</sup>All dollar quotations used herein are in British Guiana currency.

(1944 est.), 63,390. The population is approximately 50% Negro and mestizo and 25% Indian; white population is estimated at less than 2,500. The chief towns are Belize, the capital and principal port (pop., 1931, 16,687); Stann Creek (2,844); Corozal (2,197); El Cayo (1,260); Benque Viejo (1,500). Governor in 1945: Sir John Adams Hunter.

**History.**—Principal developments in 1945 were concerned with economic rehabilitation following World War II. The shipping shortage eased and hope was expressed in government circles that such facilities would be restored to near normal by 1946. Minor excitement was caused by a warning given July 19 by Ramón Blanco that German residents in the colony would join with Germans in the department of Alta Verapaz in Guatemala to create a dangerous situation. The Guatemalan government continued to assert a technical claim to the southern part of British Honduras but no specific developments took place in 1945 in the controversy.

**Finance.**—The monetary unit is the British Honduras dollar, theoretically equal to the U.S. dollar, but restricted in circulation to British Honduras and pegged in practice to the pound sterling. Estimated revenues and expenditures in 1944 were approximately \$2,250,000. Colonial debt at the beginning of 1943 was £551,996.46 and \$178,300.

**Production.**—The principal items of production are woods (cedar, mahogany and pine), bananas and coconuts. Virgin stands of mahogany, long one of the chief economic resources of the colony, were rapidly being cut. Merchantable pine was estimated in 1945 at 100,000,000 bd.ft., though many difficulties existed in marketing it. About 50% of the annual consumption of pine lumber, estimated at 2,000,000 bd.ft., was in 1945 produced locally. No important mineral production exists. Industrial production is limited; some 15,000 pairs of leather-soled shoes (of an annual consumption estimated at 70,000 pairs) were produced in British Honduras in 1945, according to estimates late in the year.

**Trade and Communication.**—Chief items of export, most of which goes to the United States, are cedar, mahogany, coconuts and bananas. Banana exports, it was hoped, would increase in 1946 because of relaxation of shipping restrictions. The principal imports, most of which come from the United States and Mexico, are lumber, flour and other foodstuffs, cotton cloth, clothing, gasoline and oils.

Most external communication is normally by steamer service although the colony is linked to Mexico and Honduras by air lines. Less than 200 mi. of highway, not all of it improved, exist. Belize opened a new airport in January; possession of a 6,000-ft. runway would, it was hoped, lead to more frequent and varied aeroplane service. Vehicle registration, Jan. 1, 1945, included 145 automobiles, 228 trucks, 2 busses and 69 motorcycles. (See also WEST INDIES, BRITISH.)

FILMS.—*Central America* (Encyclopædia Britannica Films Inc.). (R. H. FN.)

**British Isles:** see GREAT BRITAIN & NORTHERN IRELAND, UNITED KINGDOM OF.

**British Legion.** Affiliation fees in 1944-45 showed a record membership of the British legion, and the Earl Haig poppy fund, which supports benevolent work, reached its highest total at £973,562 (\$3,928,322.67). In the field of pensions the legion was proposing that a

man's lost earning capacity be taken into account, up to £600 (\$2,421) in the case of a pensioner and £400 (\$1,614) of a widow. This was a revolutionary change. In matters of employment the legion was working closely with the ministry of labour, and had representatives on all board of trade committees to license the opening of shops.

British Legion Village, Kent, for tuberculosis victims and their families, was to be further developed. New machinery was being installed at the poppy factory, Richmond, which employs nearly 400 disabled men. Cambrian weaving factory in mid-Wales was extended to employ 30 additional disabled men. A furniture-making factory was acquired at Warminster, Wilts. In different parts of the country the legion was opening homes for elderly and infirm ex-service men and women. In the autumn the women's section, which also has rest and convalescent homes, was about to open a children's home.

## British South African Protectorates.

Under this heading are grouped the British protectorates in the south of Africa, of which certain essential statistics are given in the table. See BRITISH EMPIRE for population, capital towns and status. High commissioner: Hon. Sir Evelyn Baring. For other territories of the British empire in the south of Africa, see SOUTH AFRICA, THE UNION OF.

**History.**—By the end of March 1945 advances from the colonial development and welfare fund totalled £973,356 (£1 = 403.5 cents U.S.), in roughly equal proportions. From this fund grants over the succeeding ten years were, it was announced on Dec. 12, to be £2,500,000. In Basutoland the first Roman Catholic university on African soil was founded at Roma. In Swaziland a free grant of £100,000, announced in May, provided for teacher training, better salaries for teachers and six new schools with better classrooms and equipment.

In May, the resident commissioner sent a letter to members of the Basuto council, informing them that the government intended to consult them and the paramount before passing laws affecting administration or life and welfare; at the same time he suggested that the council should become more representative of the bulk of the nation, proposing a system of district councils to make recommendations and to elect one representative for nomination as a member on the central council. Furthermore he suggested that paramount and resident might nominate other members from among agricultural associations, progressive associations, school teachers, businessmen and ex-soldiers. The letter also suggested a standing committee of five of the council to advise the paramount and resident when the council was not in session.

Basutoland and Swaziland both suffered from the prolonged

		In customs union with South Africa			

drought in South Africa, the worst for many years, which broke only in mid-October after great damage had been done to cattle and crops. In Bechuanaland, the South African minister of mines and irrigation led an expedition in August to explore the possibilities of restoring the water system round the dried up Lake Ngami. He and his experts reported the distinct possibility, by canalizing the Okovango and Chobe rivers, of irrigating 4,000,000 ac. of "possibly the finest ranching land in South Africa." Later in the year, the young chief of the Bamwangwato, Seretse Khama, paid a visit to England. (H. V. L. S.)

**British-U.S. War Boards.** Combined Food Board (United States, United Kingdom and Canada).—Acting jointly, the president of the United States and the prime minister of Great Britain on June 9, 1942, authorized the creation of the Combined Food board to obtain a planned and expeditious utilization of the food resources of the United Nations. In Oct. 1943, Canadian Prime Minister Mackenzie King accepted membership on behalf of the government of Canada.

The board was established to investigate and formulate plans with regard to any question relating to supply, production, transportation, disposal, allocation or distribution, in or to any part of the world, of foods, agricultural materials from which foods are derived and equipment and nonfood materials ancillary to the production of such foods and agricultural materials.

Although the board was originally created for the purpose of assisting the United Nations in the conduct of World War II, it was decided after the end of hostilities that in view of the scarcity of many types of food, the board should continue to exercise its functions.

During 1945 the U.S. member was Marvin Jones, war food administrator, later succeeded by U.S. Secretary of Agriculture, Clinton P. Anderson; the United Kingdom member was M. I. Hutton, head of the British food mission; the Canadian member was J. G. Gardiner, Canadian minister of agriculture.

**Combined Production and Resources Board** (United States, Great Britain and Canada).—The Combined Production and Resources board was created by President Roosevelt and Prime Minister Churchill on June 9, 1942, in order to complete the organization needed for the most effective use of the combined resources of the United States and the United Kingdom for the prosecution of World War II. On Nov. 10, 1942, the board was expanded to include a Canadian member.

It was the function of the board to co-ordinate the war effort of the member countries and, as appropriate, of other United Nations, in the production, allocation and supply of those products (other than raw materials and foodstuffs) which required combined planning in order to meet military and essential civilian requirements. It was also charged with responsibility for determining availability and sources of supply for finished products (other than raw materials and food) required to meet the needs of liberated areas.

The three member governments officially terminated the board on Dec. 31, 1945, but the plans for its dissolution contemplated that the coal and textiles committees which it had sponsored would continue to function as long as needed, but on an autonomous basis.

Throughout the greater part of 1945, J. A. Krug, chairman of the War Production board, was the U.S. member of C.P.R.B. W. L. Batt was U.S. deputy member and he continued to represent the U.S. after the War Production board was abolished on Nov. 3. The Rt. Hon. Oliver Lyttelton was the U.K. member during the first half of 1945. Changes due to the British elections and to the absorption of the ministry of production by the board of trade were so soon followed by the end of the war that no formal substitution was made in the U.K. membership, the necessary continuity being provided by Sir Henry Self, who continued in Washington, D.C. as the U.K. representative on the board. Throughout the whole of 1945, C. D. Howe was the Canadian member and G. C. Bateman, Canadian deputy member. Executive officers were: for the U.S., Ogden White (succeeded by Robert C. Turner in November); for the U.K., Viscount Strathallan; for Canada, G. C. Monture (succeeded by G. Powell Hamilton in November). Secretaries were Stanley L. Phraner for the U.S., and P. Hayward for the U.K.

**Combined Raw Materials Board** (United States and Great Britain).—The Combined Raw Materials board was established on Jan. 26, 1942, to plan and co-ordinate the raw materials programs of the two countries and to collaborate with the other United Nations to secure the most effective utilization of all raw material resources at their disposal.

The activities of the board included analysis of the supply and requirements position of the United Nations for the major critical and essential raw materials; allocation of supplies of scarce raw materials among the United Nations when necessary; and working out agreements

to expand supplies, to conserve the use of raw materials in short supply, and to co-ordinate the purchasing activities of the United States and Great Britain in foreign raw material markets.

Members of this board at the end of 1945 were William L. Batt, U.S. member; Robert C. Turner, U.S. deputy member; R. B. Whiting, U.S. executive secretary; Sir Henry Self, U.K. member; R. D. Fennelly, U.K. acting deputy member; and Howard O. Hooper, U.K. executive secretary.

The two governments terminated the board on Dec. 31, 1945, and in co-operation with other United Nations established international commodity committees to take over the functions of the board in allocating tin, metal, rubber and hides and leather which were the major raw materials under board allocation that continued to be in short supply at that time.

**Combined Shipping Adjustment Board** (United States and Great Britain).—Creation of the Combined Shipping Adjustment board was announced Jan. 26, 1942. The function of the board was to co-ordinate the work of the British ministry of war transport and the War Shipping administration.

Member for the United States in 1945 was Rear Admiral Emory S. Land, chairman of the U.S. maritime commission and administrator of the War Shipping administration. R. M. Bissell, Jr., assistant to the administrator of the War Shipping administration was executive officer. Member for Great Britain was W. O. Hart. Executive officer for Great Britain was F. V. Cross.

**Munitions Assignment Board** (Washington) (United States and Great Britain).—This board's establishment was also announced Jan. 26, 1942. Working in close collaboration with the corresponding London organization, the board maintained full information of the entire munitions resources of Great Britain and the United States and translated such resources into terms of combat forces and their material reserves. The board was responsible for making assignments of stocks and production of finished war material to the United States and Great Britain and to others of the United Nations.

Members for the United States in 1945 were Harry L. Hopkins, chairman; Adm. J. M. Reeves; Rear Adm. W. R. Purnell; Rear Adm. L. D. McCormick (succeeded by Rear Adm. V. R. Murphy and Rear Adm. E. W. Burroughs); Gen. Brehon B. Somervell; Lt. Gen. B. M. Giles (succeeded by Lt. Gen. I. C. Eaker); Maj. Gen. R. L. Maxwell; Maj. Gen. John Y. York, Jr., executive; and Col. E. C. Kielkopf, secretary. Members for Great Britain: Adm. Sir James Somerville; Lt. Gen. G. N. Macready; Air Marshal Douglas Colyer; Capt. E. M. C. Abel-Smith and Group Capt. T. E. H. Birley, secretary. The Munitions Assignments board (Washington, D.C.) was abolished after the cessation of hostilities in 1945. (See also CANADIAN-U.S. WAR COMMITTEES.)

(S. L. PR.)

**British West Africa.** Under this heading are grouped the British colonial territories on the west coast of Africa, for which certain essential statistics are given in the table. See BRITISH EMPIRE for population, capital towns, status and governors.

In Oct. 1945 it was announced that the new British Labour government, which had abolished the resident ministry, recommended in its place a West African council of governors, presided over by the secretary of state, meeting two or three times a year. To the end of March, 1945, £8,600,000 (£1=40s.5 cents U.S.) had come from the colonial development and welfare fund. Grants from this over the succeeding ten years were, it was announced on Dec. 12, to be £30,400,000. Plans were being laid for the reabsorption of demobilized soldiers. The scheme for the continuation of government control of the marketing of cocoa was postponed, because of protests from various interests including African farmers, who also protested against the season's price of 15s. a load set under the existing system. In the three main territories, Africans were appointed puisne judges; in all four territories town planning schemes were published by the town planning adviser to the old resident ministry.

In June the West African commission on higher education issued its report: the majority proposed three university colleges, at Achimota, Fourah bay and on a new site at Ibadan, each to have certain degree-giving powers. The minority (including the colonial undersecretary) recommended a closer system of one college only at Ibadan, fed by territorial colleges at the two older centres and at one new site east of the Niger. Both reports urged new technical facilities, and it was estimated that the costs, considerably more than £1,000,000, would be roughly the same.

**Nigeria.**—Development plans were announced involving £40,000,000 in 11 years, and including £6,000,000 to £7,000,000 for roads, £5,000,000 each on town and country water supplies and £5,000,000 to £6,000,000 on education. The schemes also

envisaged 60 new hospitals. A new palm oil research station was established by the agricultural department in Benin province.

On March 22 the legislative council unanimously passed a new constitution which was passed at Westminster in November. This envisaged three new regional councils at Kaduna, Ibadan and Enugu, linking native authorities and the legislative council, for which they would serve as electoral colleges. Other functions of the councils included local budgeting and discussion of local legislation. All three councils, together with the central council, were to have unofficial majorities. At the same time there should be a large decentralization of technical services to regional headquarters.

These proposals, with four ordinances providing for state control of minerals and closer control of the election of chiefs, were opposed by southern educated elements centring round the national council of Nigeria and the Cameroons. This political campaign, under which African members of the legislative council were disowned, merged into an economic grievance about the cost of living, calculated in July as 170% of 1939. On June 22, a strike of technical workers, mainly railwaymen, broke out and lasted until August, when the men, who had demanded a 50% increase in wages for technical staff, and an increase of 8d. a day for manual workers, were given 30% and 3d. a day. Since grievances continued, a commission of inquiry was appointed.

**Gold Coast.**—A fresh grant of £173,000 for teacher training was issued from the colonial development and welfare fund. Plans were being laid for a general educational survey in the south. A scheme for agricultural resettlement for ex-soldiers in the north was also mooted. During the war, the government paid off a £4,000,000 loan, and issued a new loan of £3,000,000 at a lower interest. An industrial development board was set up; in September the Trade Union congress met for the first time; a youth centre was founded in May; the first retail co-operative began in the same month. In June the Town and Country Planning ordinance came into effect, granting compulsory powers of purchase, in all "planning areas." In March a new system of four grades of native courts was instituted. A constant process of federation was taking place among the smaller states. In the spring there was a grave outbreak of infantile paralysis in the northern districts of Wa and Lawra.

**Sierra Leone.**—The scheme for a new municipality for Freetown was postponed in October because of widespread criticism of its reservations mainly developed because of previous failures. The scheme, as it stood, proposed that three wards should elect four members, who in turn would select six aldermen and a mayor, with powers reserved to the governor, who could consider appeals from local staff. Two Africans were appointed education officers.

**Gambia.**—A reorganization of Bathurst, for which £691,002 was sought from the development fund, was modified as a result of representations from London. A nutrition expert was considering plans for coping with the "hungry months."

\*Including bullion and specie.

**Bromine.** After a decline to 32,940 short tons in 1942, bromine production in the United States made a spectacular rise to 47,043 tons in 1943 and to 51,056 tons in 1944. Since more than 90% of the output is used in the production of anti-knock fluid for motor fuel, the increase could be directly attributed to the heavy demand for motor fuels in the war program. (G. A. Ro.)

**Brookings Institution:** see SOCIETIES AND ASSOCIATIONS.

**Broomcorn.** The broomcorn crop of 1945 in the United States was estimated at 31,000 tons compared with 67,000 tons in 1944 and an average of 40,000 tons 1934-43. The lower yield of 257 lb. per acre in 1945 compared with 354 lb. in 1944 and the average of 281 lb. accounted for part of the reduction in the crop. Acreage for 1945 was only 240,000 ac. compared with 380,000 ac. in 1944. The quality of the 1945 crop was reported to be good. The leading broomcorn states were Oklahoma 9,800 tons, Colorado 9,200 tons, Texas 5,500 tons and New Mexico 3,000 tons. Prices were at the ceilings during 1945 because there was a strong demand for broomcorn. (J. C. Ms.)

**Brozovich or Broz, Josip (Tito)** (1892- ), Yugoslav soldier and statesman, was born near Zagreb in Croatia. He served in the Austro-Hungarian armies in World War I and in 1915 went over to the Russians. Returning to Croatia, he became a labour leader and communist and assumed the pseudonym Tito. After the Germans overran Yugoslavia in 1941, Tito organized a band of guerrilla followers which effectively harried the axis occupation armies. Tito's partisan forces also quarrelled with Gen. Draja Mikhailovitch's Chetniks. In this internecine struggle, Tito, whose armies were numerically larger and had a broader base of support from all races and creeds in Yugoslavia, emerged the victor and his forces won Allied recognition, which formerly had been given to the Chetniks. On March 7, 1945, Tito formed a government with himself as premier and Ivan Subasitch, representing the London Yugoslavs, as foreign minister. On May 1, Allied troops joined Tito's partisan armies and the following day the Germans in northern Italy surrendered to Gen. Mark Clark's forces. Thereupon, Tito's partisans promptly occupied the port of Trieste. This act was denounced by the western Allies and on June 9 the Yugoslav leader agreed to grant Field Marshal Sir Harold Alexander command of the military government of Trieste and withdraw

MARSHAL TITO addressing crowds of celebrants in Belgrade on March 27, 1945, the anniversary of Yugoslavia's defiance of Hitler

his troops from Trieste to Gorizia. Tito's government held elections, Nov. 11, although the political opposition stayed away from the polls. However, the Yugoslav electorate sanctioned the policies of Tito and in consequence he proclaimed the abolition of the monarchy (Nov. 29) and establishment of a republic. His rule was recognized by the United States and Britain, Dec. 22, 1945.

**Brunei:** see BORNEO.

**Bruno, Giuseppe** (1876- ), secretary of the Sacred Congregation of the Council, was born at Lezzadio, province of Alessandria, Italy. He made early studies at the seminary at Acqui, and theological and juridical studies at Rome, and was ordained in 1898.

He served on the staff of the *Acta Apostolicae Sedis*, and was later named to the Commission for the Codification of Canon Law, serving under Cardinal Enrico Gasparri. He was in 1945 a member of the Commission for the Interpretation of the Code, and had been a member of the Congregation of the Council for thirty years.

On Dec. 23, 1945, it was announced that Msgr. Bruno had been nominated to the Sacred College of Cardinals. He was the only one of the nominees to the Sacred College of Cardinals in 1945 whose duties kept him regularly in Rome. The body of which he was secretary oversees the observance of church laws in regard to such matters as fasts, abstinence, keeping of feasts and holy days, regulation of parish priests, catechetical instruction, and ecclesiastical property. It also makes plans for councils and conference of bishops.

He was created and proclaimed a cardinal on Feb. 18, 1946

**Bryn Mawr College.** A resident college for women at Bryn Mawr, Pa. In 1945 Bryn Mawr added to its academic program the following courses: history of biology, by the biology department; Latin American history, by the history department; ethics, philosophy and religion; the philosophy of mind, all by the philosophy depart-

ment; the Spanish novel, by the Spanish department. In addition, under the Anna Howard Shaw lectureship, Dr. Eveline M. Burns, consultant on social security for the National Planning Association, was in residence at the college for six weeks and gave a series of six public lectures on "Social Security in an Expanding Economy." The graduate committee and the faculty approved a request of the social economy department to give up the two-year certificate in social economy and establish instead a two-year degree of master of arts in social economy. The program for the degree provided that one-half of the student's time or more be given to theoretical course work and the remainder to field work. For students who did not desire field work in social services the department offered a degree in sociology for which all the course work would be theoretical. This degree could be secured by properly qualified students in one year. (For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (K. E. M.)

**Bubonic Plague:** see PLAGUE, BUBONIC AND PNEUMONIC.

**Buckner, Simon Bolivar, Jr.** (1886-1945), U.S. army officer, was born July 18 near Munfordville, Ky., the son of a famous Confederate general. He studied at Virginia Military institute and then at the U.S. military academy at West Point, from which he was graduated in 1908. Later, he returned to West Point as instructor of infantry tactics (1919-23) and as commandant of cadets (1932-36). During World War I he commanded aviation training brigades. A brigadier general when he was put in command of the Alaska defense force in 1940, Gen. Buckner played a prominent role in the recapture of the Aleutians. He was awarded the D.S.M. in Oct. 1943 and subsequently was raised to the rank of lieutenant general. When his task in the Alaskan command was completed, Gen. Buckner reported to the Central Pacific command and was made commander of the new U.S. 10th army. On April 1, 1945, the 10th army, composed of regular army troops and marines, invaded Okinawa. Buckner frequently toured the front line areas, and ignored warnings against exposing himself to danger. It was while he was at a forward observation post watching his forces battle forward on southern Okinawa that he was fatally wounded by an enemy artillery shell, June 18, three days before victory ended one of the bloodiest campaigns of the Pacific war.

**Buckwheat.** The United States buckwheat crop was estimated by the United States department of agriculture to be 7,155,000 bu. in 1945 which was about 2,000,000 bu. less than the large crop of 9,166,000 bu. of 1944 and about the average of 7,121,000 bu. for 1934-43. The crop was planted late in many areas because of the wet spring, but frost damage was light. The average yield of 16.2 bu. per acre was relatively low compared with the yield of 17.8 bu. in 1944 and the average

*Estimated U.S. Production of Buckwheat in Leading States, 1945 and 1944*

State	1945 bu.	1944 bu.	State	1945 bu.	1944 bu.
Pennsylvania . . .	2,016,000	2,940,000	Wisconsin . . .	294,000	418,000
New York . . .	1,519,000	2,700,000	Indiana . . .	270,000	150,000
Minnesota . . .	630,000	945,000	Illinois . . .	225,000	82,000
Michigan . . .	420,000	512,000	West Virginia . .	172,000	185,000
Ohio . . .	306,000	294,000	Maryland . . .	141,000	120,000

of 16.9 bu. Pennsylvania led the principal producing states with the average yield of 18 bu. per acre. Some of the minor states had larger yields such as Maryland 22 bu. per acre, West Virginia 21.5 bu. and Vermont 19 bu. (J. C. Ms.)

**Budget, National.** The first postwar budget of the United States was submitted to congress by President Truman on Jan. 21, 1946. For the first time the tradi-

tional state of the union and budget messages were combined in one document by the president so as to present the government's entire legislative and fiscal program in a comprehensive and unified manner. This continued the development by which the president's budget message was used to a greater extent as the vehicle for outlining his views on the economic position of the nation and for co-ordinating the government's fiscal program with the requirements of the national economic situation.

The president's budget called for total expenditures in the fiscal year 1947 of \$35,124,982,043 and estimated that net government revenues would total \$31,512,702,700, the figures in both instances incorporating the proposals made by the president in his budget message. This contrasted with expenditures of \$100,404,596,685 in fiscal 1945 and \$67,393,679,135 in fiscal 1946 and with net revenues of \$46,456,554,579 and \$38,608,827,952 for the corresponding years. Thus, it was expected that government expenditures would be reduced to about a third of their wartime peak; an amount, however, that would be almost four times the budget expenditures of prewar years.

The main factor in the reduction of estimated government expenditures was the curtailed requirements for war and national defense consequent upon the complete ending of World War II. In the fiscal year 1945 war expenditures had totalled \$90,500,000,000. With the rapid demobilization and curtailment of war production after the end of the conflict in the Pacific, war expenditures for the fiscal year 1946 were expected to fall to \$49,000,000,000. The pace of the military demobilization is indicated by the fact that expenditures of \$32,900,000,000 for the first six months of that year were to be reduced to \$16,100,000,000 during the second six months. For the fiscal year 1947 the president estimated that the cost of war liquidation, occupation and national defense would be \$15,000,000,000. The

"MOW 'EM DOWN, PODNERS!" Jerry Costello of the *Knickerbocker News* (Albany, N. Y.) spoke in 1945 for the taxpayer, the man who ultimately foots the bill for government expenditures

war and navy departments were expected to spend \$13,000,000,000, while \$3,000,000,000 was to cover the activities of Maritime commission, War Shipping administration, the Office of Price Administration, and payments to the United Nations Relief and Rehabilitation administration. An offsetting item of \$1,000,000,000 was expected from the war activities of the Reconstruction Finance corporation.

The president stressed the immense task involved in winding up the global war effort. While he expected economy and increased efficiency to result from his recommended combining of the war and navy departments into a single department of national defense, he called attention to the large expenditures still required for war liquidation. Mustering-out pay to members of the armed forces, contract settlement, maintenance of the war-expanded naval and merchant fleets and of military installations, expenses of civilians in occupied areas and relief and rehabilitation expenditures were all placed in the category of war liquidation expenses.

The president recommended that authorizations for war and national defense which had previously been passed by the congress but which were no longer needed be repealed. He estimated that if this were done, the accumulative authorized war and national defense program through the end of the fiscal year 1947 would amount to \$376,000,000,000, of which expenditures would be \$354,000,000,000—the cost of World War II.

In addition to direct war and national defense expenditures it was estimated that federal expenditures for purposes largely inherited from the war would amount to \$11,000,000,000 in the fiscal year 1947, nearly one-third of the entire federal budget. The items in this category consisted of payments to veterans, interest on the federal debt and tax refunds.

Expenditures for veterans' pensions and benefits of \$4,207,779,400 would be required on the basis of existing legislation for the fiscal year 1947. The president proposed some liberalization of veterans' legislation which was expected to bring expenditures to \$4,787,000,000. The main factor in this increase was the proposed raising of veterans' unemployment allowances from \$20 to \$25 a week. Although pensions for veterans would constitute the largest single item in the expenditure total, many other benefits were to be provided, including unemployment allowances, provisions for education, loan guarantees for the purchase of housing and other property and medical care.

Since the major part of the national debt originated during the war years, the president included interest payments on the public debt among the expenditures resulting from the war. Interest payments in 1947 were estimated at \$5,000,000,000 as compared with \$4,750,000,000 in the fiscal year 1946. This increase was due to the further rise of the national debt occurring in the fiscal year of 1946. The president stated that the interest bill was already close to its probable postwar level.

The other item largely accounted for by wartime developments was estimated tax refunds of \$1,585,000,000. It was anticipated that half of this amount would be paid to individuals due to over-withholding and over-declaration of expected income. The remainder would be necessary in connection with loss and excess-profits credit carry-backs and similar features of the corporate income tax.

The general tendency in the remaining categories of federal expenditures, those associated with regular peacetime activities, was toward increased budget estimates for the fiscal year 1947. Under the general category of aids to agriculture, total expenditures were estimated at \$501,496,000 as contrasted with \$466,238,938 for the fiscal year 1946. The budget figure, however, was \$1,000,000,000 less than in the wartime year of 1945. In addition it was expected that net outlays for the price stabilization and the price support programs of the Commodity Credit

corporation would increase substantially as well as other programs of government corporations operating in the agricultural field.

With the reconversion of industry expected to be accomplished largely during the fiscal year of 1946 and the reabsorption of labour into peacetime pursuits, it was expected that expenditures for work relief would decline for the fiscal year of 1947. On the other hand, the general expenditures of the social security program, covering administrative costs and grants to states for assistance programs were expected to increase by more than \$50,000,000.

The president noted the expansion of the general works program of the government, concentrated largely in the fields of transportation and resource development. Expenditures for highways and airports were to be about double that of the previous fiscal year and substantial increases were scheduled for river and harbour development and flood control projects. The president also recommended the development of the Great Lakes-St. Lawrence seaway.

In the category of general government expense, the budget estimates for fiscal 1947 were higher than those of the previous fiscal year for all three branches of the government. The president emphasized that the responsibility of the government had increased greatly in the previous decade and that consequently the government was larger than it was before the war. He pointed out that these government expenses could not shrink to prewar dimensions without avoiding responsibilities. For the civil departments and agencies, the budget for 1947 recommended expenditures of \$1,500,450,089, as compared with \$1,244,542,797 in the 1946 fiscal year. The major part of this rise was due to a general increase in employees' salaries, though it contained no provision for the further increase of such salaries which the president recommended. The increase was due also in part to the shifting of certain functions originating during World War II from the category of national defense to regular government expenditures; for example, certain functions of the Foreign Economic administration, the War Manpower commission, and international information and foreign intelligence. Another part of the increase was to be explained by the increase in functions to be performed in a peacetime world, such as civil aeronautics, aids to business by the department of commerce, certain activities of the department of agriculture, and internal revenue collection.

In view of the favourable business outlook which existed at the time of preparation of the budget message, the president recommended that no reduction in taxes be enacted at that time. He advised that the budget be brought as nearly into balance as possible on the basis of existing tax legislation, which included the tax reductions which became effective Jan. 1, 1946. It was estimated in the budget, however, that total government revenues for the fiscal year 1947 would be substantially below their wartime level due in part to tax reductions previously mentioned but also to the decline in the level of national income that was anticipated after industrial reconversion. From a 1945 total of \$46,456,554,579, net revenues were expected to decline to \$31,512,702,700 in fiscal 1947. This drop in revenues was about equally divided between taxes on individuals and those on corporations, it being estimated that the former would decline by approximately \$7,000,000,000 between 1945 and 1947 and the latter by approximately \$8,000,000,000 over the

same time period. On the other hand, an increase in excise tax receipts was anticipated despite the reduction in rates which became effective Jan. 1, 1946. This was due to the large increase in the production of taxable, durable goods that would be available after the reconversion of industry to peacetime production.

In recommending that no further reduction in tax rates be considered at the time, the president pointed out that the expected government revenues in the fiscal year of 1947 contained nonrecurring items, principally receipts from disposal of surplus property and high tax receipts from corporations due to the lag between receipts and liabilities. He estimated that existing tax legislation would yield only about \$27,000,000,000 in future years and that federal expenditures in the future could not be expected to fall below this amount. He emphasized also that inflationary pressures were still highly dangerous and that immediate tax reduction would further strengthen these pressures.

The substantial reduction in federal expenditures coupled with the much smaller shrinkage of government receipts was expected to bring the federal budget into closer balance than at any time after 1940. It was estimated that the government expenditures would exceed receipts by \$3,612,279,343 compared with almost \$29,000,000,000 in the 1946 fiscal year and almost \$54,000,000,000 in the fiscal year 1945. In view of the success of the Victory loan drive, the president proposed that the excess of expenditures in fiscal 1947 be paid out of the treasury's cash balance and furthermore that the national debt be reduced by \$4,000,000,000 in the 1947 fiscal year. On the basis of these calculations the national debt at the end of fiscal 1947 would be \$271,000,000,000, as compared with \$275,000,000,000 at the end of the previous fiscal year and \$258,682,187,409 at the end of fiscal 1945. Thus, during the 1946 fiscal year the increase in the public debt was to be limited to around \$16,000,000,000.

ooo though this would require a substantial reduction of the treasury cash balance. As the statutory debt was \$300,000,000,000 it was evident that there would be ample margin for all public debt transactions through the fiscal year 1947.

In his 1947 budget message, the president again presented a consolidated table of the government's budget and the nation's budget which he had introduced the previous year. These data, shown in Table II, were derived from the statistics of national income and gross national product and were arranged to show the receipts and expenditures of the major economic groups of the nation—consumers, business, state and local government and federal government. (See also DEBT, NATIONAL; INCOME AND PRODUCT, U.S.; TAXATION; UNITED STATES.)

Great Britain.—The budget for the fiscal year 1945-46 was presented to parliament in April 1945, shortly before the end of World War II in Europe. In his budget message, the chancellor of the exchequer strongly emphasized its character as "interim budget."

He reviewed the domestic economic situation at length, stressing the limits reached in subsidizing the cost of living and the beneficial results of the low interest policy upon the budget. He further discussed the difficulties arising from the growth of overseas liabilities to £4,000,000,000 and the need for a postwar expansion of exports. For the time being he proposed only minor alterations in the present tax structure such as relief of international double taxation and small changes in the excess profits tax.

Estimates of total revenue for 1945-46 differed only slightly from actual receipts of the previous year and expenditures were tentatively placed at £492,500,000 below those in the preceding year. (M. Gr.)

Table III.—Government Receipts and Expenditures—Great Britain

## Building and Construction Industry.

Construction in the United States in 1945 was partially channelled to civilian projects as World War II neared its end. When hostilities ceased, all em-

phasis was placed upon civilian needs. Urban building rose steadily reaching \$186,000,000 for construction started in Sept. 1945—8% above the volume of the preceding month and more than double the amount reported in Sept. 1944. The Oct. 1945 figure—\$262,000,000—was 37% greater than Sept. 1945. Even this figure, however, was far below prewar volume. Federal construction dropped 82% from Oct. 1944.

In urban areas privately financed new residential construction increased from \$20,000,000 for work begun in Sept. 1944 to \$60,000,000 for work begun in Sept. 1945 and to \$92,000,000 in Oct. 1945. New nonresidential building increased from \$12,000,000 in Sept. 1944 to \$72,000,000 in Sept. 1945, and then to \$108,000,000 in Oct. 1945. Additions, alterations and repairs rose from \$28,000,000 in Sept. 1944 to \$51,000,000 in Sept. 1945, to \$62,000,000 in Oct. 1945. No new public residential construction was begun in either Sept. or Oct. 1945.

\*Joint estimates of the department of commerce, War Production board and department of labour. These figures refer to work put in place.

†Preliminary.

Increased employment in construction was noticeable as early as July 1945 when more than 1,000,000 persons were employed in construction for the first time after Oct. 1943. The increase was entirely on nonfederal projects, federal construction employment having dropped 12,700 from June and 65,500 from July 1944.

Construction revival was spurred by plans for building commercial, industrial and residential structures, schools, colleges, hospitals, churches and public works. F. W. Dodge reported that on May 31, 1945, there were large projects in these classifications totalling \$15,746,202,000 in the design stage or in contemplation in the 37 states east of the Rocky mountains. Since one- and two-family homes are usually built as small projects and are not usually planned far in advance of execution, relatively few of them were included. This figure, compared with that spent for actual contracts recorded by F. W. Dodge corporation in the 37 eastern states in 1939—\$3,550,543,000—indicated an unprecedented demand for materials.

The War Production board (WPB) order L41 controlling

building material distribution was terminated on Oct. 15, 1945. Stock piles, however, were practically nonexistent; the production of brick and soil pipe was at a standstill until the Office of Price Administration (OPA) permitted a price rise so that in-

dustries could pay a higher wage; lumber scarcity was made worse by strikes; heating and plumbing equipment production was slow; building labour was scarce. A prewar level of production was not anticipated before the end of April 1946. The occasion demanded a greater than prewar production.

The cost of building rose. The bureau of labour statistics' wholesale price index for building materials stood at 110.5 (1926 equals 100) in May 1943; at 115.7 in May 1944; at 117.3 in May 1945; and at 118.3 in Oct. 1945. OPA controlled the price of building materials but bootlegging was rampant. The total cost of home construction—where the demand was sharpest—was estimated to have risen 30% above 1939 costs by Sept. 1945 and to have run as high as 50% after L41 was lifted.

The housing shortage was acute and grew worse as veterans returned. Therefore, on Dec. 12, 1945, President Truman revived controls of building materials, giving priority for materials to those who built dwelling units costing not more than \$10,000. About 50% of available materials was ordered routed to this priority classification. The remaining 50% was left free for commercial, industrial and high-cost residential construction and public works to catch-as-catch-can. The president also asked congress to pass legislation controlling the sales price of old and new homes. Existing controls applied only to rental residential properties. (See also BUSINESS REVIEW; HOUSING; UNITED STATES.)

**BIBLIOGRAPHY.**—Publications of U.S. department of labour, U.S. department of commerce, Office of War Mobilization and Reconversion, F. W. Dodge corp. (D. R.N.)

**Great Britain.**—The building industry in 1945 was affected by two sudden developments. They were: the cessation of hostilities in the far east, which complicated demobilization; and the general election, which returned a government pledged to an immediate attack on the housing shortage. The popular belief that if returned the government would do its utmost to speed up building production was itself a factor in its election.

The building of houses, however, necessitated not only an adequate supply of building materials but also the recruitment of a skilled personnel. Certain training measures were put into operation to provide the high proportion of specialized labour required for a long-term policy.

It was considered expedient to curtail the construction of temporary houses in favour of permanent dwellings which, however, might incorporate prefabricated units. Where possible, German prisoners of war were employed in the clearing and levelling of sites and in the installation of services. The plan was to erect more than the 150,000 temporary dwellings—including some 30,000 prefabricated houses from the United States—previously allocated to the local authorities. Four different types of prefabricated houses ordered from Sweden in May 1945 were erected under the supervision of a Swedish foreman. They were designed for British requirements, and were prototypes of 5,000 two-story permanent timber dwellings to be set up in the country.

Considerable preparatory work was done in formulating comprehensive town-planning schemes which recognize that housing is only part of a larger problem and so require not only large-scale building operations but also an extension of public services. The erection of civic centres, schools, commercial and industrial undertakings is, in the long-run, just as necessary to the maintenance of a vigorous national life. (N. K.E.)

George Isaacs, minister of labour, addressing the Building Industries National council, said in Nov. 1945 that by June 1946 the labour force in the building and civil engineering industry would be something like 1,100,000. This compared with only 570,000 in June 1945.

On Oct. 8 and Nov. 5, 1945, tens of thousands of building workers marched through London's west end to hold protest

meetings against the reversion of their wartime wages, bolstered up by overtime to peacetime standards. The official leadership of the unions was criticized by the men's more immediate leaders as was also the delay in official negotiations. Until then building craftsmen, paid at the rate of 2s. 3½d. an hour for a 54-hour week, were earning up to £6 3s. 9d. a week without overtime. With the reduction of working hours (due to winter conditions) to 44 hours a week, their earnings fell to £5 0s. 10d. They demanded a standard week—summer and winter—of 40 hours at 3s. an hour, giving them a regular £6 a week.

**Bulgaria.** A kingdom in the Balkan peninsula. In 1940 its area was 39,814 sq.mi. with a population of about 6,370,000. Of the territories acquired after then, only the southern Dobruja, ceded on Sept. 7, 1940, from Rumania, an area of c. 2,900 sq.mi., with a population of 350,000 was to remain Bulgarian. Capital: Sofia. Chief cities: Sofia (est. 1942) 401,000, Philippopolis (Plovdiv) 99,883, Varna 69,944, Russé (Rus-chuk) 49,447, Burgas 36,230, Plevna (Pleven) 31,520. Religion: mainly Greek Orthodox; about 1,000,000 Moslems; before 1941 there were about 50,000 Jews. King: Simeon II; premier in 1945: Kimon Georgiev.

**History.**—The Fatherland Front government which had come to power in Sept. 1944 with the full backing of Russia and of the not-too-numerous local communists, continued in power throughout 1945. Its premier, Kimon Georgiev, and its minister of war, Damian Veltchev, were members of the Zveno group, which changed its former fascist leanings to a strong Russophile pan-Slavism. The most influential member was the minister of the interior, Anton Yugov, a communist, who had under his control the armed militia which ruled the country. Although the Fatherland Front (Otechestven) represented officially a coalition in which the by far strongest democratic party in Bulgaria, the Agrarians, were represented, the most important Agrarian leaders protested against the preponderant communist influence and went into opposition. Among them were George M. Dimitrov, who in May 1945 was forced to take refuge in the U.S. legation, and Nikolai Petkov, who resigned from the cabinet.

Specially established people's courts dealt with the enemies of the regime and former collaborators. Several thousands were executed, among them the former regents, Prince Cyril, ex-premier Bogdan D. Philoff and General Nikolai Mikhov. New laws "for the defense of the people's authority" threatened the most drastic punishment for any active opposition to, or excitement against, the Fatherland Front government.

Elections were first slated for Aug. 26, 1945, but they were postponed at the last minute as the result of the protests of the United States against the "undemocratic" procedure. The Russian press protested against this "interference" by foreigners in Bulgaria's affairs. Yet Bulgaria was, like Italy or Austria, a defeated enemy country, and the victorious Allies were responsible for the introduction of a truly democratic government.

The postponed elections were held on Nov. 18, 1945. The voters had only one list presented to them, the official list of the Fatherland Front government candidates. No opposition lists were presented. Under these conditions the one list was elected. The official single list comprised 94 Communists, 94 Agrarians, 46 Zvenoists, 32 Social Democrats and 11 Radicals, in each case only representing that group which was collaborating in the government, not the opposition. Foreign Minister Petko Stainoff proclaimed the election results a confirmation of the Fatherland Front's attachment to Russia—"our liberator"—and to Marshal Tito's Yugoslav regime.

**Education.**—Though elementary education is obligatory and

free for children between the ages of 7 and 14, the census of 1934 showed 20.4% of the males and 42.8% of the females illiterate. In 1939 there were in Bulgaria 252 kindergartens, 4,743 elementary schools, 1,932 junior high schools and 112 senior high schools with 969,599 pupils. Bulgaria had in 1945 one university at Sofia which in 1939 had an enrolment of 4,377 men and 1,653 women.

**Finance.**—The revenue for 1941, the last year for which figures were given, was estimated at 10,160,000,000 leva and the expenditure at 10,096,000,000 leva. On June 30, 1940, the total debt of Bulgaria amounted to 12,483,000,000 leva foreign and 11,767,000,000 leva domestic debt. The monetary unit is the lev, stabilized at 92 leva to one gram of fine gold; (1939) 1 lev=1.211 cents U.S.

**Trade and Communication.**—In 1941 imports amounted to 10,239,000,000 leva, mostly from Germany and Italy (largely machinery and war material, metal goods, textiles, vehicles and mineral oils); exports to 9,215,000,000 leva, of which the largest part went to Germany (chiefly tobacco, fruit, eggs, wheat and hides).

Bulgaria had in 1939, 2,211 mi. of railroad, 608 post offices, 798 telegraph offices and 772 telephone exchanges.

Though the country has in Varna and Burgas important ports at the Black sea and in Ruschuk an important Danube port, the merchant marine consisted only of 14 ships of 17,476 tons.

The country is predominantly agrarian, more than 80% of

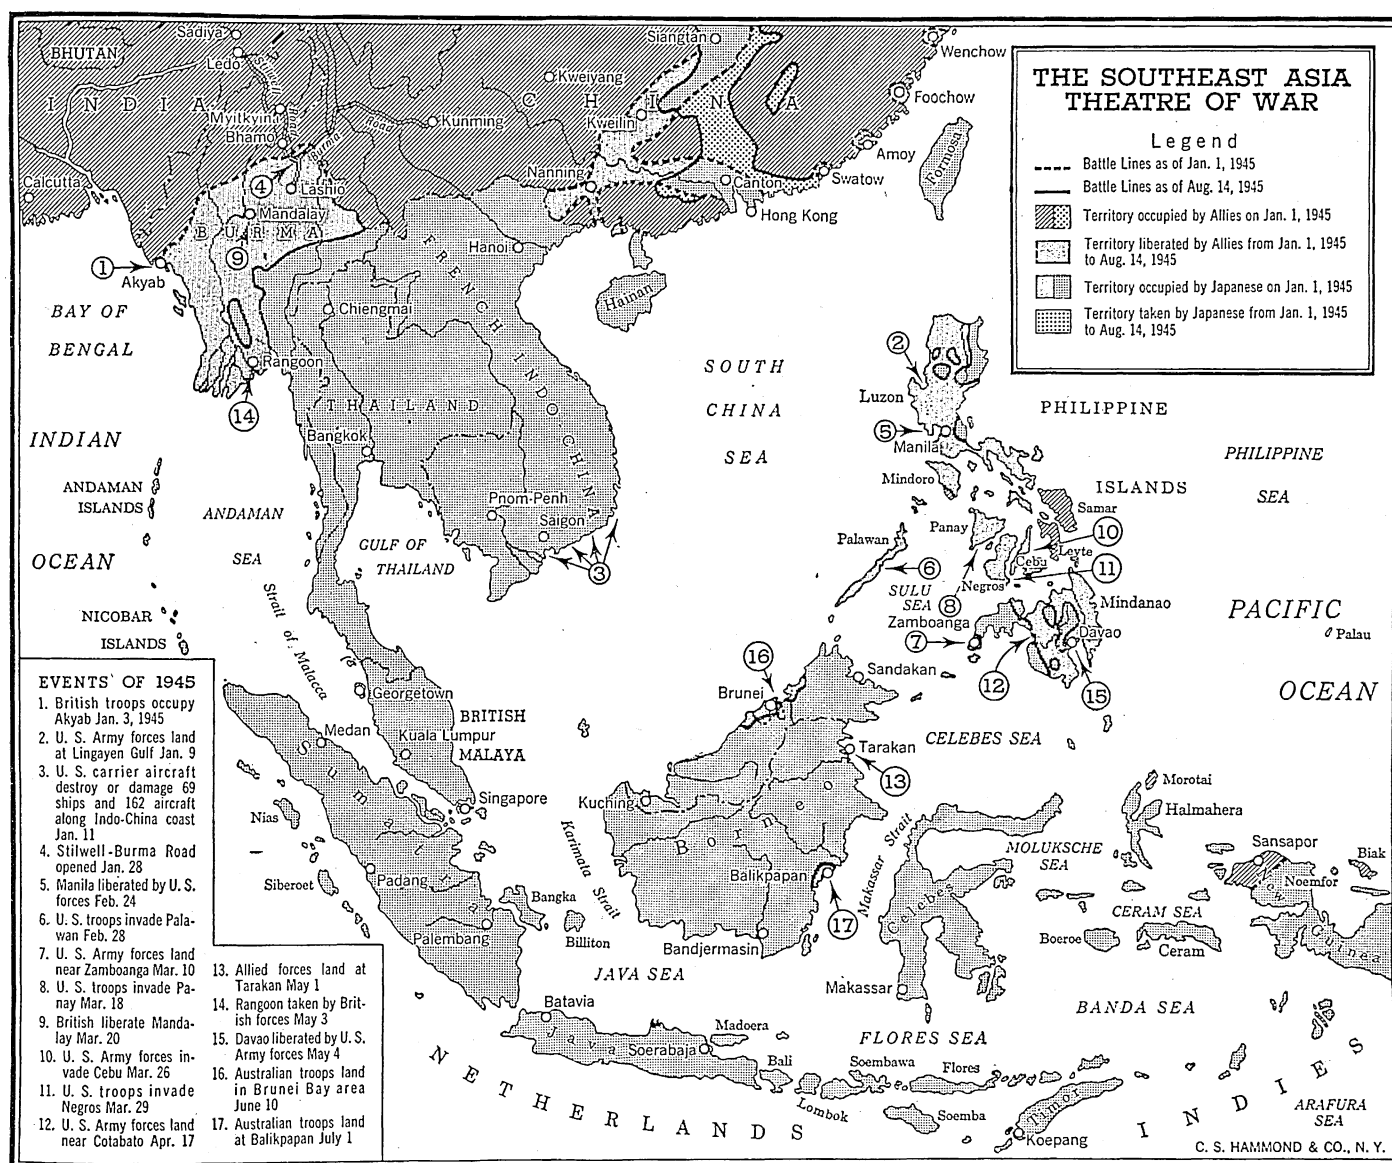

the population being engaged in agriculture in 1943. The chief crops are wheat, maize, barley, rye and oats. Fruit growing, tobacco and the culture of silk worms are highly developed. The country has rich coal deposits, but industrial development has been extremely slow.

(H. Ko.)

**Bureau of Standards, National:** see STANDARDS, NATIONAL BUREAU OF.

**Burma.** A British province lying on the eastern side of the Bay of Bengal, between India and Thailand; occupied by Japan in 1942 and liberated in 1945. Area: 261,610 sq.mi.; pop. (1941) 16,823,798. Chief cities (1942): Rangoon (cap. 501,219); Mandalay (est. 150,000); Moulmein (70,000). Religion: Buddhist (85%); governor: the Rt. Hon. Sir Reginald Dorman-Smith; ministerial advisers, the Hon. Sir Paw Tun and the Hon. Sir Htoon Aung Gyaw. Languages: Burmese and English.

**History.**—With the gradual reconquest of Burma, ending in 1945 with the Japanese surrender in September, Burma came under military administration part of which was a civil affairs service. The civil government under Sir Reginald Dorman-Smith continued in India drawing up plans for rehabilitation and reconstruction, for apart from Great Britain, Burma had suffered more material war damage and loss than any other British empire country.

Decline in rice production, disruption of communications, currency inflation, shortage of clothing and lack of shipping were the main economic difficulties of the year. Immediate recovery measures were clearance and repairs, the opening of hospitals, inoculations, and the distribution and sale of textiles, rice, salt, cooking oil, candles, etc. A practically free press was restored.

The British government declared the objective for Burma to be "complete self-government within the commonwealth and a status equal to that of the dominions and Britain." The resumption of the civil government, in October, introduced a period of civil administration controlled by the governor with direct responsibility to the British parliament. Burmese representatives were to be associated with him in executive and legislative capacities. Later a small legislative council was to be formed.

After a general election, Burmese representatives would draft a constitution and freely negotiate defense, commercial and financial agreements with Great Britain to justify parliamentary endorsement of a commonwealth status for Burma.

**Education.**—In 1940, total number of institutions 27,015, scholars 851,922; primary schools 5,679, scholars 384,060; middle 1,018, scholars 139,190; high 399, scholars 94,353; special 1,172, scholars 19,190; unrecognized institutions 18,745, scholars 212,663; university (Rangoon) 2,365 students; art college (Mandalay) 101 students.

**Finance.**—Revenue: (est. 1941-42) \$51,775,425; expenditure: (est. 1941-42) \$55,251,300; public debt: \$154,812,450; exchange rate: rupee (Rs.1) = 1s. 6d. (30.155 cents U.S.); £1 = 403.5 cents U.S. (1941-2); one crore = 10,000,000 rupees; one lakh = 100,000 rupees.

**Trade and Communication.**—Overseas trade in merchandise (April-March 1940-41): imports \$89,314,875; exports, including re-exports, \$167,386,050. Communication 1940: roads suitable for motor traffic, all weather, 6,811 mi.; seasonal 5,661 mi.; railways open to traffic 2,060 mi.; inland waterways (approx.) 1,300 mi.

**Agriculture.**—Production (1940-41) (in short tons): rice 6,720,000; groundnuts 179,200; sesamum seed 80,640; cotton 14,560; tobacco 53,435; teak 491,486.

**Mineral Production.**—In 1939 (in short tons): petroleum 331,069,920 U.S. gal.; tin concentrates 6,093; tungsten concentrates 4,863; tin tungsten concentrates 6,264; refined lead 85,120; antimonial lead 1,322; zinc concentrates 66,640; copper matte 8,887; nickel speiss 3,244; silver 6,175,000 troy oz.; gold 1,206 troy oz.

**Burma Road:** see ROADS AND HIGHWAYS.

**Burton, Harold Hitz** (1888- ), U.S. jurist, was born in Jamaica Plain, Mass., June 22. He was graduated from Bowdoin college, Brunswick, Me., 1909, and from Harvard university law school (1912) and practiced law in Cleveland, Ohio. On the entry of the U.S. in World War I, he joined the army and served on the western front. After the war, Burton resumed his practice and also served as an instructor in corporation law at Western Reserve university law school. In 1929, he was elected to the Ohio house of representatives; concurrently, he was director of law for the city of Cleveland (1929-32). In 1935, Burton ran as Independent Republican candidate for mayor of Cleveland and was elected by a large majority. He was elected U.S. senator for Ohio (1940). In March 1943, Sen. Burton together with Senators Ball, Hatch and Hill brought out the famous "B2-H2" resolution; which called for U.S. leadership and participation

in forming a United Nations organization. At the same time, Burton advocated elimination of the two-thirds majority rule of the senate required for approval of treaties. Burton's senate record indicated that he approved generally the Roosevelt administration's foreign policy and followed, with a few deviations, the Republican party program on domestic issues. On Sept. 18, 1945, President Truman named Burton as an associate justice of the U.S. supreme court.

**Busch, Ernst** (1885-1945), German army officer, was born July 6. He reached the rank of a field marshal in the *wehrmacht* during World War II, but was ousted from his command in late 1942 when Hitler reshuffled the general staff. Later, he was reinstated in a high command post, and on March 13, 1944, it was reported that Busch and Gen. Walther Model had replaced Field Marshal Generals Guenther von Kluge and Georg von Kuechler as commanders of the central and extreme northern flanks of the German armies in Russia. In April 1945, when the German armies were crumbling, Busch was appointed commander of German forces in northwest Germany, at which time he was aptly described as Germany's "last-ditch chief." On May 2, Busch, reluctant to surrender his forces to the Russians, offered to give up three of his armies in the Mecklenburg region to the British. Field Marshal Sir Bernard Montgomery declined Busch's offer. He insisted that Busch surrender to the British only those of his armies in the British line of march and that those facing the Red army negotiate their capitulation with the Russians. Busch yielded (May 4) and an estimated 1,000,000 troops gave up to Montgomery. The number of *wehrmacht* troops that surrendered to the Russians was not known. The Flensburg radio subsequently disclosed that Busch was one of several German officers selected to assist the dissolution of the *wehrmacht*. Accordingly, by order of Grand Admiral Karl Doenitz, then *reichsfuehrer*, and the British occupation authorities, Busch assumed command of the Schleswig-Holstein area to carry out this task.

Later reports that Busch had been flown out of the reich and imprisoned in a secret camp were apparently confirmed by a British war office disclosure, Sept. 12, that he had died at a prisoner of war hospital in Nottinghamshire, July 17.

**Buses:** see AUTOMOBILE INDUSTRY IN RECONVERSION; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION.

**Business Review.** **Business and War.**—In the United States the year 1945 was divided into three distinct business periods. From Jan. 1 until May 8, V-E day, were war production months; from May 8 until Aug. 14, V-J day, were the levelling-off months and from Aug. 14 to the close of the year were the transition months with reconversion for full-time civilian production. Reconversion had been initiated after the relaxation of priorities during the first quarter of 1944 and since many industries had been effecting gradual change-overs to peacetime production, no definite date for the commencement of reconversion had been fixed. Contract terminations from April 1942 through April 1945 had reached \$29,700,000,000; during the second period of 1945 another \$8,900,000,000 of war contracts were terminated; while during the month of August after V-J day an additional cancellation of \$22,800,000,000 was made by the government. Contract settlements, of course, lagged behind terminations, reaching a total of \$19,400,000,000 by V-E day, rising to \$23,700,000,000 by V-J day, and mounting to \$26,900,000,000 by the end of November. (See also WAR PRODUCTION, U.S.)

**Reconversion.**—Reconversion of plant facilities passed

through two phases during the year. First, came the cutting off of war production in the war-converted plants, a process well under way by the close of September. The second phase came with hasty resumption of civilian production on an extensive scale beginning with the acceptance of peace terms by Japan. War production could not be brought to an immediate stop as long as 12,000,000 men remained in the armed services, because of their need for food, clothing and matériel. The bureau of the budget estimated that, during the fiscal year ending June 30, 1946, approximately \$21,000,000,000 would be needed for war termination expenditures.

After the surrender of Japan many federal controls were abolished including all manpower controls; gasoline, fuel oil and many forms of food rationing; allocations of raw materials used in the production of durable goods were either relaxed or abolished entirely; and strategic metals controls were gradually withdrawn. As a result of cancellations and reconversion measures the annual rate of munitions output dropped from \$57,000,000,000 in March to about \$8,000,000,000 in December. After Aug. 14, thousands of war production contractors and sub-contractors began the inventory of materials, parts and industrial equipment that was to be turned back to the government as a prerequisite for the clearing of government property from private plants and the making of partial payments on claims for settlement and the commencement of civilian production. During these second-half months, the manufacturers faced actual cutbacks instead of the previous changes in specifications and projected deliveries.

Under the Contract Settlement act of July 1, 1944, the War Production board, government procurement agencies and Smaller War Plants corporation had established "termination-co-ordination committees" in 21 cities, and some of these had begun functioning as early as March 1945. The government also facilitated reconversions by arranging for so-called "T-loans" on contract terminations whereby different procurement agencies were empowered to extend to prime contractors loans ranging from 75% to 90% on items involved in the cutbacks.

**The Industrial Transition.**—Industry had devoted one year to preparation for a mechanized war, and nearly four years to active participation in war, during which period dire predictions of a "reconversion depression" had been made. The record of the 1945 economy repudiated such expectations. The June survey of the War Production board reported that of the 58 war industries investigated, 33 had anticipated a decrease in total production, while 25 had expected increased production after the termination of hostilities in Europe. The output of all these industries during 1944 had been valued at \$12,400,000,000, compared with prewar value of \$6,600,000,000.

The transition from war to peace had widely divergent effects in different industries. Reconversion costs were high for the passenger automobile industry where May production had been running at the annual rate of \$8,610,000,000, and year-end production had fallen to less than \$1,000,000,000. In the chemical industry, reconversion costs were very low but war production had fluctuated widely: according to the Federal Reserve board index rising to 404 (1935-39=100) in Aug. 1943, falling to 307 in Oct. 1944, again increasing to 321 in March 1945 and easing off to 227 in Sept. 1945. Conflicting economic currents were at work in the household equipment industries. On April 22, 1942, the War Production board suspended civilian production of radio sets. Wartime conversion required no costly time lags or expensive retooling, and the change-over had been made so smoothly that production of radios and other electronics had jumped phenomenally. The reconversion to civilian production in 1945 was accomplished quickly but because of inadequate supplies of proper lumber for cabinet construction, radio set output lagged far behind scheduled programs. Producers of such

"STEADY, BOY, STEADY!" Justus of the *Minneapolis Star Journal* stressed in 1945 the need for careful control in the conversion from wartime to peacetime production and economy

electrical appliances as automatic refrigerators, vacuum cleaners, washers and ironers, toasters, grills and dry shavers encountered time-consuming changes in both plant and equipment during the third quarter, and the change-over expenses for some of these producers had exceeded expectations because of the relaxation of price controls on necessary materials. Strikes in plants producing essential parts increased the difficulties of reconversion for many electrical products in the latter part of the year.

Shipments of the industrial machinery manufacturers for the first quarter of 1945 were moderately above those for the same quarter of the previous year, but V-E day resulted in cutbacks that caused extremely sharp curtailments in production. In February, the machinery production index stood at 436, by June it had dropped to 393 and in September to 250, according to the Federal Reserve board index. The production of transportation equipment was more than halved in the first nine months of the year, which had opened in January with the index at 706 and closed in September at 308. Likewise, the production of paper and paper products rose from a level of 135 in January to 143 in September; the glass products output increased from 164 to 177 during the same period, while the index of production in the printing and publishing industry moved from 102 in January to 111 in August. These are but samples of the cross-currents that marked the immediate industrial impact of the termination of hostilities and showed the relative complexities of peacetime industry compared with the unified objectives of war production.

Reconversion in 1945 differed from the conversion for war. Both labour and management were compelled to learn war production by the trial and error method but knew how to produce the civilian products to which their plants were being reconverted. The slowdown of industrial civilian production in 1945 was the result of unfortunate strikes, transportation bottlenecks, uncertainties of congressional action, government borrowings, risks of relaxations of administrative wartime controls and the rate of return of veterans.

The trends in wartime and civilian production are shown in

PHYSICAL PRODUCTION in leading U.S. war industries, 1941-45; Federal Reserve index (1935-39=100) from U.S. Department of Commerce: Survey of Current Business

Table I in the data compiled by the Federal Reserve board.

Table I.—Industrial Production for War and Civilian Purposes (1935-1939=100)

Year	Total industrial production	Production for war purposes	Production for civilian purposes
1939 . . . . .	109	1	108
1940 . . . . .	125	6	119
1941 . . . . .	162	32	130

1945 (March) . . . . .	235	155	80
1945 (July) . . . . .	211	125	86

Federal Reserve Bulletin, Sept., 1945, p. 852.

**Government Surplus Property.**—The policy of speedy sale of wartime government surpluses was adopted partly because their early disposal had been expected to prove less injurious to private enterprise immediately after the war, and partly because their value would drop sharply as civilian production was resumed, causing taxpayers to suffer from the lowered recoupments by the treasury. In August the Surplus Property administrator announced for sale \$3,000,000,000 worth of consumer goods; \$10,000,000,000 in war plants; \$4,000,000,000 in machinery and raw materials; \$1,500,000,000 in airport property and about \$10,000,000,000 in "unsalable" property, chiefly munitions. By the end of the third quarter, the total "market overhang" of government property had reached an estimated \$32,000,000,000.

In September, the war department offered 252 government-owned plants for sale at \$1,484,000,000. In December another list of 194 plants was added, bringing to more than 70% the total government-owned plants for disposal by the Reconstruction Finance corporation. By Dec. 1, private industry had purchased about \$1,000,000,000 in war plants, paying the government approximately 70 cents on the dollar. Although the most desirable plants had been sold earliest, the government agencies considered this recoupment reasonable if the difference between wartime costs and peacetime replacement costs were considered. At the end of the year the Reconstruction Finance corporation estimated that an ultimate total of 1,300 such plants was available for disposal. This constituted one-fourth of the wartime productive capacity of the nation, creating a high degree of uncertainty for private industry, and introduced an element of economic instability in the entire economy.

**Industrial Production.**—During the first four months of 1945 the value of goods and services produced at current prices was running at an annual rate of nearly \$205,000,000,000, compared with the gross national product of \$199,000,000,000 for 1944. The difference was largely accounted for by an increase in the price level rather than net additions to the physical volume of trade. Taking into consideration the uncertainties of the year retrospectively, it was not surprising that the industrial production trend

should be downward after V-E day. The index of the physical volume of industrial production reached its peak in February, according to data shown in Table II, and month by month thereafter revealed an unmistakable decline. Durable manufactures dropped more sharply than non-durable. Freight carloadings reflected this drop in industrial activity, but mixed trends were shown in department store sales. The most optimistic element was found in the doubling of the index for residential construction. The monthly changes for these primary industries from Sept. 1944 to Sept. 1945 is shown in Table II. This downward trend in industrial production was traceable to the reprogramming of military orders calling for a drop of 11% for the third quarter below that of the first, 20% in the fourth quarter and 30% for the first quarter of 1946. Combat production needs after V-E day were estimated at one-third those of the first quarter, and with time extensions granted to allow for redeployment in the Pacific during the second and third quarters, subsequent government orders had been originally expected to amount to two-thirds of those prior to May 8. In April, heavy cutbacks were made in aircraft production, but many of these were merely paper cutbacks which eliminated projected increases, rather than an actual curtailment of operations. By the end of August, industrial production had reached the lowest level from Oct. 1940. Taking physical production per factory worker for March and April as 100, the index dropped successively to 98 in June, 96 for July, 87 for August, rose slightly to 91 in September and again subsided to 88 for October. The postwar change-over in skills took time. Although the demand for shipbuilders dropped to almost nothing after August, the demand for textile workers became urgent. Workers, seeking more remuneration, waited for the creation of "suitable jobs," and organized labour leaders charged that, by referring skilled workers to unskilled jobs, the U.S. employment service had aided "an abominable system of wage-cutting and protection of sub-standard wages." Combined with decreasing domestic demands was the termination of lend-lease after V-J day, which largely accounted for the drop in industrial production of exporting industries.

**Iron and Steel.**—From Jan. 1942 through July 1945 more than 28% of the finished steel had been used by makers of ships, aeroplanes, combat tanks, ordnance and projectiles. Shipbuilding, as a giant consumer, disappeared during the second half of the year. The main steel consumers were as follows: steel converters, processors and wire plants, 18,000,000 tons; railroads, 17,000,000 tons; the container industry, 13,000,000 tons; pressing, forming and stamping plants, 10,000,000 tons; the machine tool industry, 9,000,000 tons; the automobile industry, 5,500,000 tons; oil, gas and mining industries, 5,000,000 tons; and the agricultural implements industry, 2,800,000 tons. Total monthly output of steel had been declining from the close of 1943 until the increased output of explosives and small arms munitions reversed this trend for March and April. Early opening of Great Lakes navigation had enabled large shipments of iron ore during the second quarter, but after V-J day a sharp drop in steel output occurred. Mills that had been operating at 91% capacity early in August dropped to 75% capacity by the end of that month. The third quarter rebound in output was caused chiefly by advance buying. Fear of inflationary trends that might raise future costs led the chief consumers, chiefly the automobile industry, sharply to increase orders. Supplementing this industrial fear was the government fear of increasing demobilization unemployment, so that allotments to railroads and the machine tool industry were stepped up, since industrial retooling was considered a prerequisite to increased civilian operations. This one basic industry largely held in check for the entire economy, the postwar decline in output, employment and income, and cushioned business against the full impact of a reconversion depression. (See also IRON AND STEEL.)

**Oil and Gasoline.**—Early in 1945 the world-wide inelastic demand for maximum food production led to a relaxation of allocations of oil and gasoline for farm uses. The railroads, during the war, had increased their use of diesel engines and larger annual supplies of oil were required to meet this growing demand. Until the end of gas rationing, the civilian consumption of gasoline, kerosene and fuel oil for domestic heating requirements was fixed at approximately the 1944 levels, about 65% of the normal uses in 1941. During the first half of the year, the acute need for gasoline had been met by increased and improved use of existing plants and the expansion of both crude distillation and cracked gasoline facilities. Refiners had a growing fear of dangerous excessive postwar capacity and had become reluctant to expand operations as the end of the war loomed closer. Although catalytic cracking of high octane con-

\*Preliminary.

Federal Reserve Bulletin, November 1945, p. 1141.

tinued at high levels after V-E day, a sharp reduction took place with the extensive grounding of military and naval planes after V-J day.

Crude petroleum reserves were being gradually reduced throughout 1945. Consumption outran production in February, May, June, July and August. Refinery operations ran at 93% capacity in January, rose gradually to 98% in June and July, dropped to 96% in August and to 92% by November. Stocks on hand began to drop in May and continued to decrease gradually each month in the succeeding quarter, rising slightly toward the close of the year. The Federal Reserve board index of gasoline production opened at 143 (1935-1939=100) in January, rose to 156 for July and dropped to 136 by September, but fuel oil production maintained a relatively stable level throughout the year. (See also PETROLEUM; PRICE ADMINISTRATION, OFFICE OF.)

**Railroad Transportation.**—Using freight carloadings as the most accurate index of monthly volume of trade, the peak was reached in March 1945. The heaviest snowfall in 26 years blanketed the east in February, and caused glutted transportation facilities in March. In April the high volume of war industrial output and huge farm marketings placed a severe strain on mid-west freight transportation. Until V-J day, freight carloadings ran at about the same monthly level as throughout 1944. After V-J day, August traffic dropped 12% below that for July. Third quarter carloadings ran 8% below those for the same quarter of 1944, and, with continued decline in physical production during the fourth quarter, the railroads were enabled to meet decreasing freight traffic needs.

Passenger traffic, however, had become the most acute transportation problem. The railroads had carried 7,372,000,000 passengers one mile in January, and the number of passenger miles had risen by June to 8,015,000,000 and to 8,201,000,000 for August. After V-J day, the movement of servicemen's units for purposes of demobilization was supplemented by a pronounced rise in civilian travel. Wasteful crosshauling of returning veterans to demobilization centres, only to force their retracement of the same routes back home, placed a severe strain on passenger facilities during the third and fourth quarters of the year. The public demand to have servicemen home by Christmas compounded by relaxation of controls on civilian travel by the Office of Defense Transportation created the most acute congestion of passenger traffic on record during the month of December, when traffic reached an estimated 9,300,000,000 passenger miles. (See also RAILROADS.)

**Building.**—The value of construction in 1944 totalled only \$4,000,000,000 of which more than three-fifths had been publicly financed. At the height of the war construction program, more than \$13,000,000,000 had been spent for building in 1942. In 1945 came the reversal of private building trends with the relaxation of governmental controls over war materials and manpower. The department of commerce estimated that total construction for the year exceeded by \$500,000,000 that of the previous year, despite the completion and cancellation of many federal projects.

During the first quarter, almost 30,000 new dwelling units were started in nonfarm areas, of which 26,000 were privately financed; with the end of the war in Europe, this figure rose to more than 60,000, with 50,000 privately financed; while during the third quarter the number again rose to more than 66,000 with 63,000 privately financed, according to the data released by the department of labour. By October, total privately financed new construction of all types had doubled, reaching the highest value from Jan. 1942, chiefly the result of a four-fold increase in industrial construction. Coupled with unfortunate strikes in the lumber industries, shortages appeared in such building supplies as cement, structural steel, asphalt roofing, hardware and metal products, heating and domestic equipment. Critically short were the supplies of lumber, brick, cast-iron soil pipe, clay sewer pipe, structural tile, gypsum and metallic lath. During the war years, production of these building materials had been curtailed because of disappearance of normal market demand; the lumber and forest industries had been unable to hold manpower and more than half the brick-producing plants had been completely shut down. Between Dec. 1941 and June 1945, the government had taken about 60% of all lumber produced, and for the first half-year had stepped up this requirement to 75%.

Although residential construction contracts almost doubled during the first three quarters of the year, the housing shortage became more strained with increasing demobilization pressures. Building was handicapped by the high cost of lumber which had risen 65% between Sept. 1939 and Sept. 1945; such lumber as was available was uncured for housing purposes; prefabrication had introduced an element of uncertainty; inflation had raised the price of urban building sites; skilled labour shortages persisted; and labour costs were mounting. Nevertheless the number of one-family and two-family dwelling units constructed had doubled between Sept. 1944 and Sept. 1945. The value of farm residential construction rose from \$5,000,000 in February to \$23,000,000 by September. To meet veteran housing shortages, the government stimulated the sale of barracks, cantonments, demountable houses and other salvageable building materials to states and cities, but the building industry feared that such temporary living quarters merely postponed the need for permanent housing. About 6,000,000 veterans' families needed houses at the end of the year.

Construction contracts awarded for the year reached \$2,300,000,000, a rise of 32% over the total of \$1,700,000,000 for 1944. The value of private construction contracts was up 215%, while public building had declined 16% below that for the previous year. (See also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING.)

**Company Earnings.**—For the first three quarters of 1945, corporate earnings exceeded those for the same period of 1944: for radio manufacturers, 34%; refractories, 30%; paper, 18%; automobiles 13%; petroleum, 12%; food products, 8%; drugs, 5%. Earnings for the same period were lower: for chemicals, 1%; electrical equipment, 2%; steel, 8%; machinery, 9%; copper, 14%; office equipment, 15%; carbonic beverages, 18%; auto accessories, 23%; and coal about 27%. Much of the drop in corporate operating income was at the expense of taxes, in the sense that greater net earnings would have caused higher tax payments, so that the net decline in earnings did not keep pace with

the concomitant drop in sales. Reserves, also, were reduced or abolished altogether, and earnings that otherwise would have been set aside to meet wartime contingencies became no longer necessary and proportionately larger earnings were available for corporate distribution. Among the chief economic factors tending to depress annual earnings, were, the curtailment of government orders; postwar continuation of price controls; sales of government surplus supplies; increased wages; curtailment of output by strikes and threatened legislation adverse to postwar business expansion.

The monthly average dividend rate per share for 629 companies rose from \$1.96 in January to \$1.99 in June, and maintained approximately the same level for the remainder of the year. Thirty-six leading railroad companies paid average monthly dividends in January of \$2.57; for the third quarter, \$2.69; and \$2.65 in November. Bank and insurance shares showed a very slight increase throughout the year. The highest grade industrials increased monthly average dividend payments from \$3.45 in January to \$3.54 in November. By way of contrast, the yields on common stocks for more than 200 listed corporations dropped from 4.7% in January to 3.6% in December. The yield for 25 railroad stocks showed the same trend, declining from 6.3% in January to 4.8% in December. Other utilities dropped from 5.2% in January to 4.0% in November. The highest grade industrial common stock yield fell from 3.8% in January to 3.2% in November.

U.S. Department of Commerce: Survey of Current Business.

**Retail and Wholesale Trade.**—The trends in monthly retail sales for all retail stores, department stores, variety chain stores and mail order catalogue business together with contrasting movements of durable and non-durable goods are shown in Table III. Retail trade, as a whole, remained relatively insensitive to the drop in employment and income after V-J day. Sales of all retail stores during the first seven months of 1945 were 6% higher than for the corresponding period of 1944, and after the end of the war had risen sufficiently to bring the annual average about 9% above that of the previous year. For the reporting 353 department stores the most significant gains in retail trade were made in women's apparel and accessories, of 17%; coats and suits, 19%; dresses, 22%; blouses, skirts and sportswear, 24%; junior girls' wear, 22%; women's and children's gloves, 18%; women's shoes, 17%; piece goods, 10%. About 63% of these sales were for cash, 4% were made on the instalment basis and 33% were charge account sales. Rural retail sales of general merchandise showed greatest gains in the south, reaching an all-time high in March of 320 (1929-1931=100), dropping to 194 by September. In the far west rural sales rose to 236 in March and dropped to 187 by September, while in the middle west, such sales reached their peak in March at 205 and dropped to 166 by September. During the year, the jewellery trade reached the status of a \$1,000,000,000 industry, primarily as the result of a lack of government price controls.

VOLUME OF MANUFACTURE of U.S. durable and nondurable goods, 1941-45 as estimated in the Federal Reserve Bulletin (1935-39=100)

Wholesale trade showed remarkable stability throughout the year. The department of commerce estimated sales at \$10,097,000,000 for the first quarter, \$10,482,000,000 for the second quarter and \$10,453,000,000 for the third quarter. Non-durable goods sales exceeded durables by a three-to-one ratio. In January, durable sales totalled about \$807,000,000, non-durables about \$2,741,000,000; while by September the former had dropped to \$795,000,000 and the latter had fallen to \$2,556,000,000. Wholesale prices narrowly fluctuated from a low of 104.7 in September to a high of 106.1 in June. Although consumer buying caused retail sales to rise during the last quarter, the mild weakness had developed in some wholesale markets two months prior to the war's end, continued through mid-September, but sales again revived toward the close of the year.

**Securities.**—During the period of prewar preparedness corporate new money issues increased with the growth of business activity, averaging about \$200,000,000 per quarter from the middle of 1940 to the middle of 1942. Thereafter wartime limitations on private capital expenditures combined with expansion of government facilities reduced the need for private financing. In 1945, most of the new money issues were offered by manufacturing companies in the petroleum, tobacco, railway equipment, electric utilities and telephone industries. Sales of new securities to retire outstanding issues, mainly bonds, totalled \$5,500,000,000 during the first nine months of 1945; about 25% were refunding issues offered by the railroads. Public utilities issued \$1,300,000,000, and industrial corporations for the same period retired \$746,000,000 indebtedness. So rapidly was private indebtedness paid off in 1945 that total public indebtedness exceeded total private indebtedness at the end of the war.

The new money was used chiefly to buy new plants; to purchase and reconvert war plants owned by the government; and to install improved machinery and safety devices. Exceptionally heavy corporate issues were made in the three-week period at the close of the year. The Victory loan closed on Dec. 8, 1945. Thereafter the "blackout" on marketings of private issues was lifted; the excess profits tax repeal became assured, and the fear of rising costs and threatening inflation combined to accentuate the abnormally heavy year-end financing. (See also STOCKS AND BONDS.)

**Industrial and Commercial Failures.**—The total business failures reported by Dun and Bradstreet dropped to 56 for the month of August, the first month on record when they fell as low as the fifties. Dun's Insolvency index established a new low of 3.5 business failures annually for each 10,000 business enterprises. Although the number of failures in 1945 were only three-fourths those of the preceding year, the total liabilities involved actually exceeded those of 1944. From January through August, only 39 failures were reported in the wholesale trade, compared with 68 for 1944. Retail trade failures for the same period reached 235, compared with 385 for 1944. Mining and manufacturing bankruptcies reached 188 compared with 244 for 1944. During April, total liabilities of all failures for the first time after the statistical series began ran less than \$1,000,000 per month. (See also BANKING; DEBT, NATIONAL; LAW.)

**Legislation.**—The 79th congress was distinctly more sympathetic with business than its predecessors had been from 1932. In his January Budget message, the president had called for aid to farmers; expansion of social security; reorganization of educational aids; increased appropriations for public works; maintenance of time-and-a-half pay for federal employees; creation of a national employment service; permanent mediation machinery; enlargement of the powers of the Export-Import bank; extension of the period for renegotiation of contracts; approval of the Bretton Woods agreements; repeal of loan restrictions to defaulting debtor countries; and reduction of gold reserve requirements for Federal Reserve notes. Congress responded by sanctioning participation in the Monetary Fund and Bank for Reconstruction and Development to encourage worldwide monetary stability and export trade. The reciprocal trade agreements were extended so that tariff rate reductions to the extent of 75% of the Smoot-Hawley tariff rates could be effected. Restrictions on foreign loans were removed; price controls were extended; and the charter for the United Nations organization was ratified.

ASSEMBLY LINE in a toy factory at Pittsburgh, Pa., operating at full capacity to fill Christmas orders. Reconversion from the manufacture of fin assemblies for the navy rocket program was effected in 1945 in less than 48 hours

After reconvening on Sept. 6, congress repealed the excess profits tax; the declared-value excess profits tax; lowered combined normal and corporate surtaxes from 40% to 38% for 1946; raised individual income tax exemptions, removing about 12,000,000 taxpayers from tax liability; reduced commodity taxes; emasculated the full employment budget bill; and approved the extension of war powers of the president.

Business gained more, however, through the relaxation of administrative wartime controls, than through legislative enactment in 1945, although suffering from administrative cutbacks, contract renegotiations and cancellations and termination of lend-lease. (See also TAXATION.)

**Foreign Trade.**—Lend-lease shipments dropped sharply after V-E day, since that program was legally designated as a mutual aid defense measure, and the postwar needs of Europe were thereafter administered by the United Nations Relief and Rehabilitation administration. Lend-lease was not formally abolished until V-J day. Supplementing postwar relief and rehabilitation efforts, loans to Great Britain amounting to \$4,400,000,000 were authorized in December, with the provision that after five years, repayments would begin and be completed within 50 years.

Lend-lease shipments continued the decline which had begun well before V-J day, and by August were 46% below the March to May average. Non-lend-lease exports gradually reached \$332,000,000 by August, well above the depressed levels during the war months, but had not risen sufficiently to offset the declines in lend-lease shipments. On the other hand, relief exports increased rapidly after V-E day, but they continued as a relatively minor part in total export trade. On the basis of the 1923-24 average, the export index started out at 204 in January, rose to 231 for March and April, and reached the peak of the year in May at 261. After V-E day, this index fell to 198 in June and, by V-J day, had collapsed to 173 for August and to 121 for September.

The most striking feature of general imports had been the remarkable steadiness in the value of monthly imports. Between the low and the high of the first three quarters, the variation of import values was less than 12%. The index stood at 122 (1923-25=100) in January, and by May had risen to 130. Table IV indicates the comparative trends of merchandise exports and imports for the years 1944 and 1945, together with the monthly trends in lend-lease exports. (See also AVIATION, CIVIL; AVIATION, MILITARY; INCOME AND PRODUCT, U.S.; INTERNATIONAL TRADE; RUBBER; SHIPBUILDING; WAGES AND HOURS.)

Table IV.—Comparative Trends of U.S. Exports and Imports for 1944 and 1945

Month	Value of U.S. exports (in millions)		Total lend-lease (domestic and foreign goods)		General imports (in millions)	
	Total domestic and foreign merchandise (including lend-lease)		1944	1945	1944	1945

**Great Britain.**—The wholesale price index fluctuated within the narrow range of 167 (1930=100) in January to 171 in July, while retail prices showed a slightly greater variation, rising from 168 in January to 176 in July and dropping off more sharply to 169 by September. The cost-of-living index likewise rose from 202 in January to 207 in July (1914=100), showing somewhat greater instability than in the United States. On the other hand, security prices opened in January at 128.5 (1921=100) and moved within the narrow range of one point for the remaining months of the year, while those in the United States exhibited one of the most startling increases in stock market history after the end of the war in Europe.

Grocery sales were depressed by further cuts in rations imposed during the early summer. The clothing sales index by September had reached 133% of 1942 prices compared with 106% for the average of the preceding 12-month period. Additional ration coupons were issued upon demobilization which largely accounted for this unusual increase in clothing demands. Increased sales of dress material, boots and shoes and wearing apparel brought to the lowest levels on record the existing stocks on hand.

The postwar election of the labour government stimulated demands for the nationalization of the Bank of England, railways, telecommunications, airlines, local utilities and coal mines. Just at the time when maximum business energies were needed to re-establish speedy return of industrial production, these political changes exerted a depressing effect on all trade. The slowdown of domestic production was offset by the temporary palliative of a \$4,400,000,000 loan by the United States, which had the effect of a postwar extension of lend-lease. (See also GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.)

**Canada.**—Canada emerged from the war in a strong economic position. The war had speeded industrialization. Physical volume of business declined during 1944 and continued throughout the first eight months of 1945, chiefly because of retarded industrial reconversion. The manufacturing index showed a steady month by month decline throughout the year. The labour force engaged in war production had declined by nearly one-third by V-E day to about 600,000, by V-J day to 425,000 and had fallen abruptly to about 200,000 by the end of September. During the period from June 1939 through June 1945, living costs had risen 18% compared with 29% in the United States and 30% in the United Kingdom. Wholesale prices had risen about 40% in both Canada and the United States compared with 70% in Great Britain. The index of physical production opened in January at 228 (1935-39=100), rose to 232

"UNCLE GULLIVER," a cartoon by Shoemaker of the *Chicago Daily News* which appeared in Oct. 1945

in March and gradually dropped to 212 in August. The fluctuating construction index rose from 96 in January to 205 in April but fell to 150 by August. (See also CANADA, DOMINION OF; COPPER; STRATEGIC MINERAL SUPPLIES.) (E. H. HE.)

**Butter.** Creamery butter production in the United States declined further to the lowest point after 1925. Government controls directed the milk into other products such as cheese, canned and dried milk. Total butter production was estimated by the United States department of agriculture at 1,764,000,000 lb. in 1945 compared with 1,841,000,000 lb. in 1944 and a prewar average of 2,170,000,000 lb. in 1935-39. Of the total output about 1,427,000,000 lb. was used by civilians at the rate of 11 lb. per capita compared with 17 lb. per capita in prewar years. Stocks of butter in storage in 1945 were much lower at the beginning of the year than in 1944 but increased to a high level by September when the reduced restrictions increased domestic production.

Milk production reached a new high record in 1945, 3% above the previous high record of 1943. The excellent pastures in 1945 combined with an abundant supply of concentrated feeds and the large number of cows on farms produced a record output of milk. With the end of World War II and government incentives in June 1946, the high record yields were expected to decline sharply. More cream would go into butter, however, since the wartime demand for dried milk was expected to decline. The demand for butter continued high during the fourth quarter of 1945 because consumers resumed their usual consumption of about 17 lb. per capita compared with the fewer than 12 lb. available during the war. At the same time however creamery butter production declined largely because of the termination of war orders. Rationing of butter was reduced sharply in July and again in October when about 100,000,000 lb. of the government-held stocks were released for civilian consumption. The termination of all rationing about Dec. 1 gave further impetus to consumption. The prices of milk and butter fat were controlled by ceilings and continued steady through 1944 and 1945. The total cash income of milk producers was

the highest on record. The government subsidy of 5 cents per pound was discontinued on Nov. 1, 1945, and the retail price ceiling on butter raised an equivalent amount. (See also CHEESE; DAIRYING; MARGARINE; MILK.) (J. C. Ms.)

**Byelorussia.** Byelorussia, or the White Russian Soviet Socialist Republic, is one of the 16 member states of the soviet union. According to the census of 1939 it had a population of 5,567,976 on an area of 48,868 sq.mi. In 1939 the provinces of Poland, where White Russians lived, an area of more than 34,700 sq.mi. with a population of about 4,000,000, were added. During World War II, White Russia was devastated.

At the conference at Yalta, Pres. Roosevelt agreed to the Russian demand that Byelorussia would be recognized as having the status of an "independent" nation and that its delegates would be admitted to the United Nations conference at San Francisco. The conference voted accordingly. Byelorussia was represented at the conference by a delegation under Kuzma V. Kiselev, the people's commissar for foreign affairs. (H. Ko.)

**Byrnes, James F.** (1879- ), U.S. jurist and government official, was born May 2 in Charleston, S.C., of Irish parentage. At the age of 14 he left school to become office boy of a law firm. By studying stenography, he advanced to the position of court reporter. In 1910, he was elected to the house of representatives on the Democratic ticket and was re-elected six times, serving from 1911 to 1925. In 1930 he was elected to the U.S. senate and was re-elected in 1936. In June 1941 he was appointed associate justice of the U.S. supreme court. After serving 16 months on the supreme court bench, he was named by President Roosevelt to head the newly created Office of Economic Stabilization on Oct. 3, 1942. On May 28, 1943, he was moved into another newly created office, topping all other government agencies, the Office of War Mobilization. In 1944 Byrnes ordered many drastic job controls to siphon off available manpower into war production. He attended the Yalta conference, Feb. 4-11, 1945. Two months later (April 2), he resigned as war mobilization director, asserting that victory in Europe was near and that his main task was completed. On June 30 President Truman made Byrnes secretary of state. Byrnes then accompanied the president to the Berlin conference (July-August) where the groundwork was laid for the meeting in London of the council of foreign ministers. This London parley ended in failure; Byrnes asserted, Oct. 5, that the deadlock resulted from Russian refusal to compromise on procedural matters. While Big Three unity was strained as a result of this stalemate, it was cemented at the succeeding parley of British, U.S. and Russian foreign ministers at Moscow in December. At this meeting, the conferees reached agreements on the drafting of European peace treaties, far eastern problems and on atomic energy control. Byrnes asserted, Dec. 27, that an important result of this conference was the establishment of closer and more cordial relations between the Big Three powers.

**Cabinet Members.** The following members of President Truman's cabinet held office on Jan. 1, 1946:

Post	Name	State
Secretary of State.....	James F. Byrnes.....	South Carolina
Secretary of the Treasury...	Frederick M. Vinson.....	Kentucky
Secretary of War.....	Robert P. Patterson.....	New York
Attorney-General .....	Thomas C. Clark.....	Texas
Postmaster General .....	Robert E. Hannegan.....	Missouri
Secretary of the Navy.....	James V. Forrestal.....	New York
Secretary of the Interior....	Harold L. Ickes.....	Illinois
Secretary of Agriculture....	Clinton P. Anderson.....	New Mexico

Post	Name	State
Secretary of Commerce.....	Henry A. Wallace.....	Iowa
Secretary of Labor.....	Lewis B. Schwellenbach....	Washington

**Great Britain.**—After the general election in July 1945 the British Labour cabinet was composed as follows:

Post	Name
Prime Minister.....	Clement Attlee
Lord President of the Council.....	Herbert Morrison
Secretary of State for Foreign Affairs.....	Ernest Bevin
Lord Privy Seal.....	Arthur Greenwood
Chancellor of the Exchequer.....	Hugh Dalton
President of the Board of Trade.....	Sir Stafford Cripps, K.C.
First Lord of the Admiralty.....	A. V. Alexander
Lord Chancellor.....	Lord Jowitt
Secretary of State for the Home Department.....	J. Chuter Ede
Secretary of State for Dominion Affairs.....	Viscount Addison
Secretary of State for India and for Burma.....	Baron Pethick-Lawrence
Secretary of State for the Colonies.....	G. H. Hall
Secretary of State for War.....	J. J. Lawson
Secretary of State for Air.....	Viscount Stansgate
Secretary of State for Scotland.....	J. Westwood
Minister of Labour and National Service.....	G. A. Isaacs
Minister of Fuel and Power.....	Emanuel Shinwell
Minister of Education.....	Ellen Wilkinson
Minister of Health.....	Aneurin Bevan
Minister of Agriculture and Fisheries.....	Tom Williams

The following were appointed ministers of cabinet rank:

Post	Name
Minister of Supply and Aircraft Production....	John Wilmot
Minister of War Transport.....	Alfred Barnes
Minister of Food.....	Sir Ben Smith
Minister of State.....	P. J. Noel-Baker
Minister of Pensions.....	Wilfred Paling
Minister of Works.....	George Tomlinson
Minister of Town and Country Planning.....	Lewis Silkin
Minister of National Insurance.....	James Griffiths
Minister of Civil Aviation.....	Lord Winstanley
Minister of Information.....	E. J. Williams
Postmaster-General.....	The Earl of Listowel
Chancellor of the Duchy of Lancaster.....	J. B. Hynd

For other ministers and members of the government, see GOVERNMENT DEPARTMENTS AND BUREAUS.

"CARRYING OUT THE ROOSEVELT POLICIES." Darling of the *New York Herald Tribune* refers specifically to the almost complete cabinet shakeup under President Truman in 1945

**Cabot, Hugh** (1872-1945), U.S. surgeon and educator, was born Aug. 11 in Beverly Farms, Mass. After taking his M.D. at Harvard university, 1898, he practised medicine in Boston and was associated with the Massachusetts General hospital. In 1910 he became assistant professor of surgery at Harvard Medical school. During World War I, he served with the British royal army medical corps, was mentioned in four dispatches and decorated by the king. A specialist in genitourinary surgery, Dr. Cabot was dean of the University of Michigan Medical school, Ann Arbor, Mich., 1921-30, overseer of Harvard university, 1929-35, and professor of surgery at the University of Minnesota Graduate school and surgeon at the Mayo clinic, 1930-39. He encountered criticism from the medical profession for his advocacy of group practice in medicine. He asserted that the fee system of private medical practice was "antiquated," maintaining that adequate medical care for the greatest number of people could best be achieved by group health co-operative organizations. In 1940, he charged that "200,000 people were dying needlessly in the U.S. each year" because of "inadequate, inferior and terribly expensive care." In early 1941, he testified as a government witness in an antitrust action taken by the U.S. against the American Medical association; the latter was charged with restraining and hindering operations of a government-sponsored group health co-operative providing medical care for dues-paying members. Dr. Cabot was the author of *Surgical Nursing*, four editions (1924, 1930, 1937, 1940), *The Doctor's Bill* (1936) and *The Patient's Dilemma* (1940). He died while sailing in Frenchman bay, near Ellsworth, Me., Aug. 14.

**Cacao:** see COCOA.

**Cadmium.** Production of cadmium in the United States increased from 3,182 short tons in 1940 to 4,233 tons in 1943 and 4,390 tons in 1944. Exports, which had been scaled down from 194 tons in 1940 to 90 tons in 1943, rose to 234 tons in 1944, offset only by 33 tons of imports and 53 tons of secondary recovery. In spite of heavy demands, stocks had been built up to 1,703 tons at the end of 1943, declining to 1,513 tons in 1944.

Outputs of other leading producers in 1944, so far as available, were as follows, in short tons, with 1943 figures in parentheses: Australia 280 (177), Canada 263 (393), Mexico 724 (884); the Mexican output is in the form of flue dust, which was exported to the United States and was recovered as a part of the U.S. total.

(G. A. Ro.)

**Caggiano, Antonio** (1889- ), cardinal archbishop of Rosario, Argentina, was born at Coronda, province of Santa Fe, Argentina, on Jan. 30. He was educated at the Colegio de la Immaculada, Santa Fe seminary and the Latin-American Pian college at Rome, and was ordained in 1912. He was named bishop of Rosario in 1935, taught philosophy and science at the Santa Fe seminary, and served as chaplain of the charity hospital, counsellor of university students and chaplain of the Colegio del Huerto.

In 1929 he returned to Rome to study the organization of Catholic Action. Two years later he was selected by the hierarchy as General Ecclesiastical Counsellor of Argentine Catholic Action and was largely responsible for the growth of this movement in Argentina, Paraguay and Uruguay. He held many important posts in the Argentina church.

On Dec. 23, 1945, it was announced that he had been appointed to the Sacred College of Cardinals. He was created and proclaimed a cardinal at consistory on Feb. 18, 1946.

**Calder, Alexander Stirling** (1870-1945), U.S. sculptor, was born Jan. 11 in Philadelphia, Pa. After studying at art schools in the United States and abroad, Calder exhibited his works, won many art prizes and awards throughout the country and by 1913 was made a member of the National Academy. Several years later, he was elected to the National Institute of Arts and Letters. His works are included in permanent collections of the Pennsylvania Academy of Fine Arts, the Smithsonian institution, the Metropolitan museum and the Museum of Modern Art in New York. Among his principal works are the Washington figure for the arch in Washington square, New York city; the Shakespearean memorial, Philadelphia; the monumental groups of Nations of East and West and the Fountain of Energy, San Francisco; and a statue of Leif Ericsson presented by the U.S. in 1932 to Iceland in commemoration of the 1,000th anniversary of the Althing. His last completed piece of sculpture, a monumental head of Winston Churchill, was exhibited in New York in 1944. Calder taught at the National Academy of Design and the Art Students league of New York city and was named to the city's municipal art commission in 1937. He died in New York city, Jan. 6.

**Calendar of Events, 1945:** see pages 1-16.

**California.** The most southerly Pacific coast state of the United States, frequently called the "Golden state." It acquired statehood Sept. 9, 1850. Area: 158,693 sq.mi., of which 1,890 sq.mi. is water. Pop. (1945 est.) 8,842,700; in the 1940 census it was 6,907,387. Capital, Sacramento (1940 census: 105,958); other leading cities are Los Angeles (1,504,277); San Francisco (634,536); Oakland (302,163); San Diego (203,341); Long Beach (164,271); Berkeley (85,547); Glendale (82,582); Pasadena (81,864). Heavy increases in population in all these cities took place during World War II.

**History.**—California lost one of its most colourful political figures by the death on Aug. 6, 1945, of Hiram Johnson, who had represented the state in the United States senate from 1917 after being twice governor. An individualist and staunch isolationist who had opposed entry of the U.S. into the League of Nations in 1919, he died only a few weeks after casting his vote against its joining the United Nations organization planned at the San Francisco conference.

Much attention was focused upon San Francisco in May and June during which time delegates of the United Nations met there to work out a plan for a permanent world organization. In December representatives of the city made vigorous efforts in London meetings of the United Nations preparatory commission to locate the permanent seat of the world organization in San Francisco.

On June 19 the state legislature ended the longest session in its history, with many measures transmitted to Republican Governor Earl Warren for signature or rejection. Since war dangers had been largely removed, a war council created to handle emergencies which might arise from attack or invasion was abolished and its responsibilities assigned to a disaster council, and a war catastrophe fund of \$25,000,000 was unfrozen for other uses. Two other councils—Production, and Reconstruction and Re-employment—were retained for the 1945-47 biennium. Unemployment insurance provisions were liberalized. An interim committee was set up to give further study to a plan backed by Governor Warren for prepaid medical care through a system of compulsory health insurance; the proposal aroused much political controversy. Creation of a state recreational commission as proposed in one measure was defeated but \$15,000,000 was voted for improvement and main-

tenance of state park and beach facilities. Salaries of state employees were increased due to higher living costs, and additional sums for improvement of the state educational system were planned. With finances in good shape, tax reductions established in 1943 were continued and the exemption base for the personal income tax was broadened.

The cost of living increased in California during 1945 in common with the rest of the U.S. The housing situation became more acute as the war shifted to the Pacific and was heightened after its termination because west coast ports became congested with returning servicemen and their families. Likewise many persons who had been attracted to California to work in its war industries decided to remain permanently in the state even though war work had decreased in volume. Following the end of the war some industries in the state were affected by labour unrest, with the greatest publicity being given to strikes in the motion picture industry. In connection with the actual end of the war V-J day celebrations in San Francisco were marked by disorder which amounted to rioting accentuated by the presence of large numbers of servicemen. The return of former Japanese residents to their homes after restrictions were lifted in Dec. 1944 was also marked by some incidents of violence, and the opposition to their return was such that many Japanese preferred to settle elsewhere.

**Education.**—The budget for the 1945-47 biennium estimated school expenditures at \$216,283,711 (for the previous biennium, they were estimated to have been \$195,627,819). Average daily attendance for the 1943-45 biennium in elementary schools was estimated to have been 689,876 pupils; in secondary schools, 348,371. Enrolments in higher educational institutions for the fall and winter terms were reported as exceptionally heavy, due in part to the registration of returning servicemen under the G.I. bill of rights.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—In 1944 California supported 20 institutions, among them: 8 mental hospitals, average number of inmates 24,591; 3 correctional schools, average number of inmates 1,179; 4 penal institutions, average number of inmates 5,255; 2 veterans homes, average number of inmates 976; 1 home for the adult blind, average number of inmates 109. The previous temporary increase to a \$50 maximum per month for the needy aged was made permanent by the legislature but an attempt to eliminate responsibility for support by relatives where possible was voted down.

The budget for the 1945-47 biennium included \$119,675,144 for social welfare and public health (1943-45, \$97,412,613).

**Banking and Finance.**—State banks in 1943 numbered 282, with deposits totalling \$1,792,259,000 and resources amounting to \$2,209,011,000.

Appropriations for the 1945-47 biennium were set at \$893,933,000 (1943-45, \$770,394,000, not including war catastrophe reserve). Reserves totalled \$142,151,000 including postwar unemployment and construction funds. The surplus in the general fund on July 30, 1945, amounted to \$126,276,000, and it was announced that sufficient funds had been set aside to pay off all currently outstanding general obligation bonds. On July 1 final payment was made on bonds issued in 1873 which included indebtedness going back to 1850 and with one item being the cost of the golden quartz stone contributed by California to the Washington monument.

Tax collections for 1944-45 reached the all-time high of \$558,300,659 for one fiscal year (1943-44, \$546,242,341). The unemployment insurance tax returned \$164,162,201 (1943-44, \$174,991,676); retail sales tax, \$150,314,238 (1943-44, \$135,000,000), and this at a rate one-sixth lower than for the previous year; bank and corporation franchise tax, \$58,017,090

(1943-44, \$67,670,970); personal income tax, \$47,133,080 (1943-44, \$48,323,088); gasoline tax, \$43,967,426 (1943-44, \$42,472,955).

The total property tax levy for all local government jurisdictions for 1944-45 was estimated at \$337,885,547, while for the 1943-44 fiscal year it had been estimated at \$313,475,145. The assessed value of property subject to local taxation for the 1945-46 fiscal year was estimated at \$8,541,000,000.

**Communication.**—In 1940 California had 16,856 mi. of railway, with 2,768 mi. of this electrified. Public highway mileage amounted to about 900,000 mi. The 1945-47 budget assigned \$46,179,967 to expenses concerned with highways and streets (1943-45, \$44,852,544). A postwar highway construction program involving \$115,000,000 was announced in August, with its progress dependent upon availability of materials and labour and distribution of federal funds of which the state had been allotted \$22,303,236 early in 1945. Motor vehicles registered in 1943 numbered 2,504,987 automobiles, 211,375 trucks, and 18,930 motorcycles. In Sept. 1943 the state was estimated to have 2,120,700 telephones.

**Agriculture.**—Crop production in 1944 was valued at about \$1,201,440,000, claimed to be higher than for any other state in the U.S. Fruit and nut crop acreage in 1944 amounted to 1,588,998 acres (10,700 more than 1943) with production estimated at about 6,824,000 short tons worth approximately \$620,000,000 to growers. Plantings for 1944 were 56% over 1943, with the greatest acreage increase being in grapes. Farm milk production (1943) amounted to 2,407,000,000 gal.; butter production to 37,523,000 lb.; ice cream production to 30,836,000 gal.

**Manufacturing.**—Labour statistics for 1945 indicated the steady decline from peak employment in 1943 had continued. When World War II ended in August the number of labourers employed in durable goods industries (exclusive of clerical and administrative help) was 414,000, only 58,000 more than in Dec. 1941. In July 1945, the number was 431,000; in Aug. 1944, 605,300. Aircraft workers in Aug. 1945 numbered 111,200 (Aug. 1943, 243,000), and shipyard workers 128,500 (Sept. 1943, 282,500). Nondurable goods industries employed (Aug. 1945) 225,600 labourers (Aug. 1944, 237,700). In April 1945, California was registered as leading all states in regard to the number of federal employees working within its boundaries (313,400); New York, with 297,800, was second.

**Mineral Production.**—Final returns on mineral production for 1944 showed that total value of output reached \$469,774,525 (1943, \$426,445,280) for 62 different mineral substances, exclusive of gems. This was the greatest on record. In general, fuels, industrial materials and salines had increased in output while metals and structural materials declined.

Value of Principal Minerals Produced in California, 1944 and 1943

Product	Value (1944)	Value (1943)
Petroleum . . . . .	\$330,659,802	\$298,400,000
Natural gas . . . . .	31,797,418	28,046,729
Gold . . . . .	4,108,055*	5,191,480
Copper . . . . .	3,453,957	2,278,120
Structural materials . . . . .	50,777,220	55,055,016
Miscellaneous stone . . . . .	25,138,003	21,716,223
Cement . . . . .	21,249,520	27,517,926
Brick and tile . . . . .	3,930,662	4,368,675
Salines . . . . .	20,983,104	15,660,400

\*Gold production for 1944 was lower in value than in any year after its discovery in the state in 1849.

**California, University of.** This university is a state-supported, co-educational

institution with headquarters at Berkeley where the university was founded March 23, 1868, and with seven other campuses, at Los Angeles, San Francisco, Davis, Santa Barbara, Riverside, Mt. Hamilton and La Jolla. During 1945, University of California research related to the war, in which 165 contracts totalling \$57,000,000 were awarded by various branches of the United States government, reached its apex with the presentation of (1) the army-navy "E" award for excellence of production to the University of California Los Alamos Scientific laboratory, where the atomic bomb was designed and made, and (2) a scroll for research on the Berkeley campus, fundamental to the production of the atomic bomb, which contributed materially to the successful conclusion of World War II. The presentations at both places were made by Major General Leslie R. Groves, United States army officer in charge of the atomic bomb project. During the United Nations Conference on International Organization, in San Francisco, heads of the delegations from most of the leading powers represented attended a convocation in the Greek theatre on the Berkeley campus, at which they spoke and were awarded the honorary degree of doctor of laws. Those receiving this honour were: Edward R. Stettinius, Jr., United States; Anthony Eden, Great Britain; Georges Bidault, France; Ezequiel Padilla, Mexico; T. V. Soong, China and Jan Christiaan Smuts, South Africa.

New activities included the establishment of a college of engineering, with emphasis on aeronautical engineering, on the Los Angeles campus; a university-wide institute of industrial relations, designed to aid in the solution of problems of labour and management; and a similar institute of geophysics. The year 1945 saw the end of the engineering, science and management war training work conducted on a college level in industrial centres of the state by the university, with a total of 151,202 enrolments. The Davis campus (agricultural) was reopened for students, after two years' occupation by the United States army signal corps. A medical school on the Los Angeles campus was authorized by the regents of the university. Emphasis turned from war service to postwar plans and needs, with approximately 2,500 service men and women, discharged from the armed forces, registered among the total of 18,500 full-time resident students on all campuses. (For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (R. G. S.)

**Calles, Plutarco Elías** (1877-1945), Mexican statesman and military leader, was born Sept. 25 at Guaymas, Sonora. For his earlier career see *Encyclopædia Britannica*. Little is known of his early life, except that he was certainly poor. In 1911, General Calles joined the revolutionary movement that overthrew Porfirio Díaz. He served with Gen. Alvaro Obregón in the campaign against Pancho Villa, and in 1924 was elected president. He was pledged to continue Obregón's social reforms—land for the peasants, education for the masses and legitimate profits for honest business—but clashed with the Catholic Church which objected to the religious and educational planks of his platform. Calles supported Emilio Portes Gil in the 1928 presidential elections, and Gen. Lázaro Cárdenas in 1934. Later Cárdenas quarrelled with Calles and exiled the latter in April 1936. Calles then set up residence in the United States. He returned to Mexico, May 5, 1941, after the retirement of Cárdenas and subsequently was returned to his post in the Mexican army. Later, Calles and Cárdenas had presumably patched up their ancient quarrel as they had appeared together as guests at a dinner given by Mexican army leaders in Sept. 1942 for Pres. Avila Camacho. Calles died in Mexico City, Oct. 19.

**Cambridge University.** The academic year 1944-45 opened with 2,700 men and 489 women undergraduates. In addition, graduates, research students and staff numbered 1,220 men and 177 women. Evacuated colleges contributed a further 1,378 students and 127 staff. Of these colleges the following departed at the end of the academic year: Bartlett school of architecture; London school of economics, Queen Mary college; and St. Bartholomew's hospital medical college was preparing to leave. There had been during World War II also a few students from King's college, London; University college, Hull, and University college, London. By 1945, these had gone.

Two new professorial chairs were founded, in comparative law and experimental medicine, and a music tripos was established. A benefaction was received from the Shell Oil companies for a chair and school of chemical engineering. The following chairs were filled during the year: classical archaeology, German, pure mathematics, laws of England, electrical engineering, metallurgy and physics. The following retired at the end of the academic year: the masters of Sidney Sussex (G. A. Weekes) and Jesus (Dr. W. L. H. Duckworth); the principals of Ridley hall (J. P. S. R. Gibson) and the women's training college (Miss H. Dent); and W. W. Buckland, regius professor of civil law.

**BIBLIOGRAPHY.**—*Cambridge University Reporter*, vol. 75; *Cambridge Review*, vol. 66. (C. Fo.)

**Cameron, Sir David Young** (1865-1945), British etcher and painter, was born June 28 in Glasgow, Scotland, and studied art at the Glasgow academy. Sir David's landscape etchings and drypoints were classed by critics as following in the tradition of Sir Francis Seymour Haden (Whistler's brother-in-law), who exercised wide influence over later English etchers. He was elected associate of the Royal academy in 1911 and was knighted in 1924. His works are included in the collections of leading museums in Great Britain and the dominions. He was a trustee of the National Gallery of Scotland and was appointed his majesty's painter and limner in Scotland in 1933. He was also the author of *The Clyde Set* (1890), *North Holland* (1892), *North Italy* (1896), *The London Set* (1900), *Paris Etchings* (1904) and *Etchings in Belgium* (1907). His etchings illustrate Sir Herbert Maxwell's *Story of the Tweed* (1905), *The Compleat Angler* (1902) and R. B. Cunningham Graham's *District of Menteith* (1930). He died in Perth, Scotland, Sept. 16.

**Camouflage.** The closing year of World War II brought out practically no new tricks in the technique of "making things seem something else," but it did show the

AT FIRST GLANCE this picture looks like merely a peaceful snow scene. But close inspection shows rifles sticking out of a dyke where members of a Scottish regiment patrolled the Zetten front in Holland. Camouflaged in white suits, early in 1945, they were barely visible against the snow

A 26-ACRE CAMOUFLAGE VILLAGE on the roof of the Boeing plant no. 2, manufacturing B-29s and Flying Fortresses at Seattle, Wash., was revealed on July 23, 1945. It was built by U.S. engineers against the threat of Japanese air raids. Its buildings, autos, etc., showed correct proportions from above, but averaged 4 ft. in height. Lawns were of chicken wire; roads and houses of canvas

improved facility with which trained camoufleurs practised their art. An estimated 35,000 students had taken camouflage training at the Air Force Tactical centre at Orlando, Fla., over a period of two years. Trained in the arts of offensive and defensive deception, these men practised in every battle theatre the camouflage tactics learned in class rooms. They represented only a fraction of the trained force available.

Observation of enemy means and employment of camouflage, particularly as regards air observation, brought out sharp contrasts with Allied activities in the same field. German and Japanese dummy aircraft, in fact nearly every deceptive effect they employed, was, to them, primarily a defensive weapon. However, the Allies looked upon deception primarily as an offensive weapon. The enemy set up his dummies solely so that they would be bombed; Allied dummy installations were designed to confuse the opponent's intelligence service. The Allies sought to make him guess wrong as to Allied strength, Allied dispositions, and the possible sequence of Allied objectives. U.S. camouflage engineers felt that they had done a superlative job if their work was so good that it pinned down great masses of enemy troops and equipment against a mobilization of target cloth, strings, wood and wire. The real, thoroughly masked strike could be made at another point where the enemy's line would surely be found considerably weakened.

The enemy used two types of camouflage in the closing months of the war to good effect. Where the Japs were securely entrenched on coral islands, they very skilfully painted plane silhouettes on the white coral. At 4,000 ft. it was practically impossible to distinguish these from the real thing. When night raiding planes were hammering at Berlin they were at first greatly confused by a series of nine dummy installations built around the city. German dummy planes were masterpieces of plywood art and foolproof to even low-altitude observation. But they were too elaborate, too difficult to manufacture, and too cumbersome for ordinary transportation means. By contrast, American dummies were built to allow of easy and rapid handling. They were prefabricated from wire, target cloth and wood. Made in sections, hinges were installed to provide compact folding, a decided transportation asset. It was estimated that, by U.S. methods, an entire squadron of dummy fighters (24) could be folded up and loaded onto two  $2\frac{1}{2}$ -ton trucks. Thirty trained men could build such a squadron

of fighters in two weeks, along with all the other trickery necessary to the building of a mock air base—supply trucks, gasoline dumps, personnel shelters, anti-aircraft guns and emplacements, etc.

The dismantling of camouflage equipment was shown in a war department press release of Oct. 5, which announced the destruction of 1,000,000 gal. of bituminous emulsion camouflage liquid, formerly used in disguising roads and airfields, in the building of artificial cities masking war plants, and in giving concrete block houses the appearance of residences. As a camouflage agent it was practical but it possessed no civilian utility.

## Camp Fire Girls.

With the end of World War II in 1945, the Camp Fire Girls, grown to a membership of more than 350,000 girls in the United States, mobilized for peacetime service to home, community and the world. The Camp Fire Girls have a long record of victory contributions, embracing salvage, bond sales, child care, hospital aid, victory gardens, farming, helping the Red Cross, the Office of Price Administration and defense councils. Accurate membership figures were not available in 1945 for Great Britain. The headquarters were bombed out three times and all records destroyed, although the group continued to function during the war and contributed largely to war service.

As one example of their efforts, these young people sold \$2,437,500 worth of bonds during the Sixth War Loan drive, which paid for a total of 1,250 army ambulances. Secretary of the Treasury Henry Morgenthau, just before he left office in 1945, sent a national citation to the Camp Fire Girls commending their distinguished service rendered in behalf of the war finance program.

At the San Francisco Conference of the United Nations, Camp Fire Girls of that city presented a "treasure chest of books" to the French delegation for the children of France. On Sept. 18, 1945, thousands of Camp Fire Girls observed a national "share the food day" by eating meals typical of the very meagre diet of war-devastated countries. Cash savings in the cost of food were sent to the Edith M. Kempthorne fund for furthering Camp Fire's international friendship program.

During the Victory Loan drive of November and December 1945, it was Camp Fire's special responsibility to sell bonds, the money from which was to be used for occupational therapy to help in rehabilitation of the wounded.

Every year Camp Fire Girls choose a coast-to-coast project to highlight a vital theme of the entire program. "Hi, Neighbor!", an adventure in friendship, was the special 1945 project. The girls explored their own neighbourhood to discover what was old or new, good or bad, foreign or native, and how it should develop in the postwar world. A "neighbourhood fair" provided a fitting climax to this survey, which focused attention on the racial background of each community and the contributions of foreign lands and cultures. During the summer of 1945 this interest in world friendship was continued through a United Nations theme for the camping season.

The project for 1946 was announced and was titled "At Home in the World." This program was planned to star the important role of the home in building a family of nations. Fun with the family was to be featured in parties, hobbies, trips, picnics, home-safety checkups and fix-it campaigns. Collecting a picture gallery of children and home life in other countries was to be one activity of the project.

In 1945 President Harry S. Truman accepted the position of honorary president of the Camp Fire Girls. Headquarters are at 88 Lexington avenue, New York 16, N.Y. National presi-

dent in 1945 was Dr. Bernice Baxter. Mrs. Franklin D. Roosevelt was honorary chairman of the advisory council. Martha F. Allen was secretary and national executive and Earle W. Brailey was treasurer.  
(C. F. Lo.)

**Canada, Dominion of.** A dominion of the British Commonwealth of Nations (Statute of Westminster, 1931, 22. Geo. V. c. 4) covering all portions of North America north of the United States, except Newfoundland, Labrador and Alaska. Canada is a federal union of nine provinces united under the terms of the British North America act (a statute of the imperial parliament, 1867). The original provinces were Nova Scotia, New Brunswick, Quebec and Ontario; to these were added, Manitoba 1870; British Columbia 1871; Prince Edward Island 1873; Alberta and Saskatchewan 1905. Outside the provincial boundaries are the Yukon and the Northwest Territories, which are under the jurisdiction of the national government. The area is 3,694,863 sq.mi.; pop. 11,506,655 (census of 1941). The capital is Ottawa (pop. [1941] 154,951). Montreal is the largest city (pop. [1941] 903,007). Provincial capitals and their population (1941 census) in order of the provinces listed above are: Halifax (70,488); Fredericton (10,062); Quebec (150,757); Toronto (667,457); Winnipeg (221,960); Victoria (44,068); Charlottetown (14,821); Edmonton (93,817); Regina (58,245). Other leading cities, population based on the 1941 census are: Vancouver (275,353); Hamilton (166,337); St. John, N.B. (51,741); Kingston (30,126); Fort William (30,585); Saskatoon (43,027). The governor general during the year 1945 was the Earl of Athlone; the prime minister, William Lyon Mackenzie King.

Population increases and shifts of considerable significance were observed during 1945. On the basis of ration books issued it was computed that the population was 12,250,000 as of Oct. 1, 1945. A part of this increase was accounted for by immigration—in the first six months of the year, 13,920 persons entered the country. Of this number, the British Isles provided 9,760, the majority being, presumably, war brides and their children. Within Canada, a considerable shift in population took place occasioned by the attractions of war industry. The areas which gained in population were, Nova Scotia 8,000; Ontario 58,000; British Columbia 90,000. There appeared to have been a marked movement to urban centres. For example, the population of Quebec city was estimated, as of Nov. 1, to be 183,441. Of this total 169,113, or 92.2% were French-speaking, 13,574, or 7.4% were English-speaking; the remainder 754, or .4%, were Jewish, Chinese and Greeks. The figures given from the census of 1941 in the preceding paragraph are subject, therefore, to considerable revision.

**History.**—Parliamentary activity characterized the year 1945. General elections for the national parliament took place in June, as well as general elections for the local parliaments of Ontario, Manitoba, Nova Scotia and British Columbia. These latter occurred in October. Since these were the first elections to take place after the end of World War II, an unusual degree of interest surrounded them. In addition, there were a number of bye-elections, both national and provincial, which provided further means of testing public opinion.

On March 31, the Canadian parliament was prorogued, with the election day being set for June 11. An unprecedented number of candidates (964), representing all parties, were nominated for the 245 seats of the house of commons. In the old house, party standing was as follows, Liberals 161; Progressive Conservatives 39; Co-operative Commonwealth Federation 10; So-

PRIME MINISTER W. L. Mackenzie King, Canadian Liberal party leader stumping at Montreal prior to his re-election in 1945

AMPHIBIOUS LORRIES, guarded by Canadian troops, were part of the equipment massed near the Rhine river prior to the great assault of March 1945

cial Credit 10; other parties 14; vacancies 11 (*Canadian Parliamentary Guide*, 1944). On the basis of the voting on June 11, the new standing was, Liberals 118; Pro. Con. 66; C.C.F. 28; Social Credit 13; *Bloc Populaire canadien* 2; Labour Progressive 1. The voting of the armed forces did not alter materially this standing. The Liberal party, under the leadership of Mackenzie King, continued in office, although with a manifestly reduced majority. The Pro. Con. party, as before, formed the official opposition. A number of cabinet ministers, the most notable being Mackenzie King himself, were defeated. A new seat was found subsequently for King in the Ontario riding of Glengarry. The leaders of the other major parties, John Bracken, Progressive Conservative and M. J. Coldwell, Co-operative Commonwealth Federation, were both returned. For the first time Bracken took his seat in the house of commons, after his elevation to the Progressive Conservatives leadership in Dec. 1942. The general elections, therefore, brought into active public life promising new figures, including a number of ex-servicemen.

Provincial general elections were held in Ontario, Manitoba, British Columbia and Nova Scotia. In the Ontario elections, the administration of George Drew was overwhelmingly sustained, as the following figures indicate: Pro. Con. 66; Liberals 11; C.C.F. 8; Labour-Progressive 2; Liberal-labour 3. Before dissolution, party standings were, Pro. Con. 38; C.C.F. 34; Liberals 15; Independent Liberal 1; Labour 2. In Manitoba, polling took place on Oct. 15. The government of Stuart Garson (Coalition) was sustained with a slightly reduced majority. The result of the vote was as follows: Coalition 43; C.C.F. 9; Independent C.C.F. 1; Labour-Progressive 1; Independent 1. The Coalition government was composed of Progressives, Progressive Conservatives, Social Credit and a number of Independents. The Nova Scotian election took place on Oct. 24. It resulted in the Liberal government of Angus Macdonald carrying 28 of the 30 seats in the assembly. The C.C.F. party secured two seats; the Pro. Con., none. Before dissolution, party standing was as follows: Liberals 23; Pro. Con. 4; C.C.F. 3.

On the next day (Oct. 25), voting took place in British Columbia. The Coalition government of John Hart improved its position by carrying 37 of the 48 constituencies. The C.C.F. secured ten seats; Labour, one. Previous to the elections, party standing was as follows, Coalition 30; C.C.F. 15; Labour 1; Independent Liberal 1. The Coalition government in British Columbia was composed of the former Liberal and Pro. Con. parties.

Bye-elections, both national and provincial, took place in 1945. On Feb. 5, a bye-election for the national parliament was held in Grey North. This resulted in the defeat of General A. G. L. McNaughton, the minister of national defense, at the hands of Garfield Case, Pro. Con. Case was returned again in the general elections on June 11. On Nov. 22, a provincial bye-election took place in Beauce county, Quebec. Georges Poulin, the candidate for *l'Union Nationale* won an overwhelming victory over his Liberal and Social Credit opponents. On the same day, a provincial bye-election was held in Wadena, Saskatchewan, resulting in the return of the government, C.C.F. candidate. In British Columbia, the Coalition candidate was returned for Okanagan on Dec. 19. In Prince Edward Island, local bye-elections brought about the return of both a Liberal and a Progressive Conservative candidate, in Fifth Prince and in First Prince respectively. In neither Saskatchewan, British Columbia nor Prince Edward Island did the bye-elections affect the standings in the house of assembly.

The first session of the 20th parliament met on Sept. 6. The speech from the throne outlined the program of legislation, the submission of the charter of the United Nations; the rapid relaxation of wartime controls; demobilization; sponsorship of measures to promote world trade; clarification of Canadian citizenship. The speech referred to the nomination of field marshal, the Hon. Sir Harold Alexander, as governor general, to take office early in 1946.

On Oct. 22, the minister of finance introduced the budget. This document contained an impressive statement of Canada's contributions during the six years of war. The war expenditure was more than \$15,000,000,000, of which more than 45% was met out of current revenue, after supplying all other ordinary

government expenses. The remainder of this huge sum was supplied by the genuine savings of the Canadian people, invested in dominion government securities. The budget contained, as well, some very welcome reductions in taxation. The most welcome was probably the announcement that personal income taxes would be reduced 16% as of Oct. 1. Other reductions favoured business enterprise. The excess profits tax of 100% was cut to 60%; the excess profits tax on advertising being abolished. The war exchange tax on imports from countries outside the commonwealth was abolished. The excise tax on furs and on fur-trimmed garments was reduced. The sales tax was removed from machinery and from appliances of production. All these reductions, the minister declared, were but the first steps in a general program of reductions. A complete revision of the taxation structure, especially of the personal income tax, had to wait the outcome of the Dominion-Provincial conference (*see* discussion of Dominion-Provincial conference, below). Considerable attention was directed to the Customs Tariff act, which was included in the budget. Following discussion in the house, all amendments to the act, some 34 in number, were withdrawn, since they gave the impression that they involved increases in the tariff. In view of the early impending international conferences on trade, the minister agreed to withhold these.

Because of their social and economic implications, certain legislative measures were of great moment. In the spring, the government published its report on employment. This paper, described as a *White Paper on Employment and Income*, outlined a program of providing occupations, roughly in excess of 1,000,000 more than the number available in 1939. The basis of the program was to encourage private industry to expand. The government undertook to provide employment through public works, only when private enterprise was unable to do so. The government also declared itself prepared so to budget during years of surplus that it could meet lean years without substantially increasing the burden of taxation. When parliament met, the minister of reconstruction reaffirmed this policy. Private enterprise was to have a free hand in providing employment through conversion from wartime to peacetime economy. The second element in the program of social legislation was housing. In April, the government declared its intention to stimulate construction in order to meet the needs of the returned servicemen, and to supply adequately the increasing civilian population. In accordance with this declaration, the government set as its objective the construction of 50,000

housing units for the first construction year following the close of World War II. It also proposed generous grants for slum clearance, and for financing housing projects in areas where employment might suffer from the cancellation of wartime contracts. Thus, its policies respecting employment and housing were linked. By midsummer, the value of new building contracts totalled \$58,875,000, as compared with the \$37,315,000 of June 1944. In spite of these efforts, the housing situation remained acute. On Aug. 20, the Wartime Price and Trade board extended its emergency shelter regulation to cover all Canada. Up to that time it had applied to only seven specially designated "congested" areas. Upon the meeting of parliament, a Central Mortgage and Housing corporation, capitalized at \$25,000,000, was created. This body administered the National Housing act, and assisted mortgage companies in home financing. The object was to increase the liquidity of mortgages, and to encourage lending at low rates of interest. The third social security measure was the Child Allowance act, the provisions of which went into effect on July 1. The first payments under the act, amounting to \$17,560,394, were made in July. While the act was designed to benefit directly its specific recipients, the children, indirectly it would aid in increasing the purchasing power of families. Hence, in its operation, the act was economic as well as social.

Other important legislation was introduced in the course of the session. The most important was probably the National Emergency Powers' bill (Bill 15). The introduction of this measure was necessitated by the conclusion of the war, and the automatic lapsing of many of the national government's powers. Considerable criticism was levelled at the bill. In general, it was considered as being too sweeping, and, in particular, fault was found with clause "G," section III. This clause gave the government authority to exclude, deport and even to deprive persons of their nationality. A measure was introduced to increase the payment of members of parliament. By this, the indemnity was raised \$2,000 above the previous \$4,000. For private members, this sum was to be considered free from income tax, but not for cabinet ministers, senators nor for the leader of the opposition. Although not strictly in the realm of legislation, discussion upon the adoption of a distinctly Canadian flag stirred much interest. In the speech from the throne, the government proposed the formation of a parliamentary committee to examine this subject. In November the committee was named, consisting of 50 members, drawn in equal proportions from the house of commons and from the senate. Before the close of the session in December, more than 600 designs had been submitted. Accordingly, the committee was unable to bring in any definite report.

Royal commission reports were presented during 1945. In May, the royal commission on the taxation of annuities and of family corporations made its recommendations. Respecting annuities, a number of suggestions were made, the chief of which was that the capital of the annuity be regarded as exempt from taxation, but the portion of the annuity representing interest should be taxable as income. The Commission on Veterans' Qualifications reported in late October. The report recommended the completest co-ordination between the national and provincial governments in the rehabilitation of ex-servicemen. The commission also made very strong recommendations for extended technical training, and for the establishment of additional technical schools and institutes. The royal commission on co-operatives reported in December. It recommended that co-operatives engaged in merchandising and marketing be subject to ordinary taxation; credit unions to continue to enjoy exemption. A third royal commission, on the coal industry, completed its investigations, but not its report in the course

CANADIANS IN ITALY made increasing use of mules in getting supplies over the snow-covered mountain roads. Leading this pack train is a Canadian quartermaster sergeant and an Italian guide

of the year. It might be assumed that the commission would outline a comprehensive fuel policy, which would assure adequate supplies in periods of emergency, and which would assure Canadian miners satisfactory protection against foreign competition. A royal commission investigated the Halifax V-E day disturbances.

The Dominion-Provincial conference met in the latter part of 1945. This body was summoned for the purpose of determining the postwar relationships, financial and of kindred character, between the dominion and the provincial governments. The matter of national health insurance was also a subject for discussion, the dominion government having prepared a draft bill thereon. Thus, the ending of the war, together with the failure of the conference of 1940, gave the conversations a note of great urgency. The conference opened at Ottawa on Aug. 6, 1945. The chief proposals put forward by the spokesmen of the national government were new agreements regarding taxation and subsidies. The provinces were to vacate the field of personal income tax in return for the assumption by the dominion of many social measures which had been met, in whole or in part, by the provinces: old age pensions, maintenance of needy persons, unemployment insurance, etc. The national offer also included grants to the provinces and to the municipalities for public works projects under the full employment scheme. The dominion likewise offered to increase the subsidies paid to the provinces by a minimum of \$12 a head, based on the 1941 census. None of these proposals trenched on the constitutional rights of the provinces, nor called into question the relationships of national and local governments. The proposals were acceptable in general, and discussion proceeded on them. A co-ordination committee, consisting of the prime minister and the premiers of the provinces was set up, charged with general supervision. This committee met again in November, when the proposals put forward by the national government were discussed after a period of examination. The discussion apparently was frank and helpful. Some of the provinces requested definite assurance as to the tax field which would be left them, if the national government assumed full powers of direct taxation. Exceptions were taken, as well, to the national government's measure extending emergency controls. Thus, while finality was not achieved in these preliminary discussions, a wide measure of acceptance was gained for many of the proposals. The conference was to reconvene at the beginning of 1946.

Between certain of the provinces, important agreements were reached. The two most notable were between the provinces of Ontario and Quebec. Early in the year, they agreed to a division of succession duties on the estates of persons who died in one province, but who held property in the other. This measure, which became operative as of Feb. 1, put an end to the practice of levying double succession duties. On Nov. 22, the two governments agreed to the development of a hydroelectric power site at Des Joachim on the upper Ottawa river. The Des Joachim plant was expected to be the start of the \$200,000,000 postwar program of the Ontario Hydroelectric Power commission. While these agreements had nothing to do with the Dominion-Provincial conference, they were indicative of the practical co-operation between the several governments.

The status of Japanese residents in Canada was the subject of much discussion. Of these, the total number was 23,149 (1941 census) about one-half of whom were Canadian-born. Living chiefly in British Columbia, they were subject to various disabilities even before the outbreak of war. With the declaration of war on Japan, they were disabled further; for example, they were not allowed to join the Canadian armed forces. In Feb. 1942, the government evacuated the Japanese from the

"defense zone," a strip about 100 mi. wide along the Pacific coast. A security commission was empowered to move the Japanese, who were treated as a racial bloc, no distinction being made as to citizenship. The Japanese were dispersed, about 16,000 being within British Columbia, but outside the defense zone, the remainder in Alberta, Manitoba and Ontario. In 1944, the prime minister made a declaration, which may be regarded as a statement of official policy towards the Japanese. The gist of this was that it was desirable that the Japanese should be scattered across Canada, likewise that the loyal be distinguished from the disloyal, the latter being returned to Japan. In the spring of 1945, detachments of the royal Canadian mounted police interviewed the Japanese to ascertain those who wished to return to Japan. By September, it was stated that about 9,000 so desired, although the accuracy of this figure could not be vouched. In December, however, some 2,000 of these reconsidered their position, and asked to be allowed to remain in Canada. Repatriation was expected to commence, probably in Jan. 1946, in co-operation with the United States, which was also returning a number of persons of Japanese origin. The dispersal of Japanese throughout Canada, as of Dec. 11, was as follows: British Columbia 15,000; Alberta 3,500; Manitoba 2,800; Quebec (the Montreal area) 850.

**External Relations.**—External trade problems and problems of external relations occupied Canada throughout 1945. In the early summer, the prime minister, along with parliamentary representatives of the other political parties, attended the San Francisco conference of the United Nations. The Canadian delegation was responsible for the adoption of several important measures, including the complete revision of the chapter on the social and economic council. The prime minister, and the minister of justice, signed the World Security charter with powers under the great seal of Canada. This was the first occasion that this instrument was used in external relations. In the autumn, Prime Minister King visited London and Washington. In the former capital, he conferred on vital matters with Clement R. Attlee, the prime minister of Great Britain; in the latter, he attended conferences on the atomic bomb. The U.S. loan to Great Britain attracted wide attention in Canada, the more so, since it was followed by statements from the prime minister of Great Britain that the system of commonwealth preferences might be abandoned, if there were reciprocal action for the general reduction of tariffs. This was in line with statements of the minister of finance when he withdrew the tariff proposals in his budget. It might be assumed that the Washington-London agreement would be followed by an Ottawa-London agreement on comparable lines. At the end of 1945, Great Britain was indebted to Canada to the extent of \$561,000,000. It was, therefore, in the interest of Canada to have the purchasing power of Great Britain restored. The situation was complicated by the practice of Great Britain in withholding or cancelling import licences, thus affecting adversely Canadian export interests. In prewar years, Canadian manufacturers of farm machinery, office equipment, household appliances and other lines of goods had built up a very profitable market in Great Britain. The action of the British government threatened them with total loss in Great Britain, and probably in other sterling areas, as well. A similar cause of irritation was the decision of the British ministry of war transport prohibiting British vessels from purchasing supplies in Canada. After ten days, this order was rescinded. In order to stimulate export trade elsewhere, Canada extended large credits to the following states, Czechoslovakia, the Netherlands, the Netherlands Indies, Norway, Russia and Belgium.

The status of the Canol project caused some discussion between Ottawa and Washington. When Japanese attack on the

Pacific coast seemed imminent, the United States government developed the petroleum fields in the Fort Norman area, Northwest Territories, as a parallel undertaking to the Alaska highway. The project cost in the neighbourhood of \$134,000,000. The right of acquisition was reserved by Canada, when the original agreement was made. Toward the end of 1945, however, the Canadian government decided to waive its right. It was understood that private petroleum companies, notably Imperial Oil, were investigating with a view to purchase. The petroleum reserves were estimated to be about 30,000,000 bbl. To make the proposition profitable commercially a larger pipe line would be necessary, and a different refining centre (Whitehorse, Y.T.) chosen.

Looking to closer co-operation in world affairs, parliament ratified the charter of the United Nations and the Bretton Woods financial agreement. In October, the Food and Agriculture organization of the United Nations met at Quebec, under the chairmanship of L. B. Pearson, the Canadian ambassador to the United States. The conference was attended by 40 representatives of the United Nations and associated powers. A contribution to the humanitarian work of the United Nations was the gift by the Canadian people of 12,555,000 lb. of clothing. Clothing collections were made throughout the autumn for free distribution to the suffering peoples of war-devastated Europe and Asia.

**Canada in World War II.**—The conclusion of hostilities in Europe and Asia made the year 1945 a convenient point at which to summarize the achievements of the Canadian people and of their armed forces. Until V-E day, Canadians were engaged actively in western Europe. Early in February, the Canadian forces began their offensive south of Nijmegen in southern Netherlands; by the end of the month, they held more than 40 mi. along the Rhine, and had captured 14,500 prisoners. Canadians were engaged also in Italy, along the Adriatic coast and in the Po valley. On April 23, however, it was announced that all Canadian army formations were fighting as part of the 1st Canadian army in north-western Europe. Forming the left flank of the western allies, the 1st Canadian army was closing in on Emden and Wilhelmshaven when the German armies surrendered on May 8. In the final ten months of the war, Canadians captured 190,000 prisoners at a cost to themselves of 43,000 casualties. On July 4, Canadian troops entered Berlin to take over their assigned occupational zone. The Canadian army of occupation numbered 25,000, who policed approximately 80 sq.mi. in the north-western part of the country.

Upon the conclusion of the European phase of the war, plans were made for large-scale operations in the Pacific. For a year or more, Canadian officers and observers had been attached to the United States and Australian forces gaining information in tropical and jungle warfare. In May, the prime minister announced the details of Canada's Pacific force, an infantry division, supported by armoured and service troops. At an earlier date (February), the minister for naval defense had disclosed something of Canada's naval contribution, some 250 vessels of various types. These forces saw no active service, since the surrender of Japan occurred before their transfer from Europe was completed. Nor did Canadians take any part in the occupation of Japan, although the instrument of surrender was signed on behalf of Canada by Col. Moore Cosgraves on the historic occasion on board U.S.S. "Missouri" in Tokyo bay, Sept. 2. Thus, Canada, which had entered the war in Sept. 1939, was represented at its dramatic conclusion. The cost to Canada of its participation was 41,371 dead; total casualties 104,925.

The repatriation and rehabilitation of the Canadian armed forces proceeded throughout 1945. As speedily as shipping could be obtained, Canadian personnel was withdrawn from the war zones, leaving behind only occupational and essential troops, the latter being principally officers and noncommissioned officers. The women's services, Canadian women's army corps, women's royal Canadian naval service, and women's division, royal Canadian air force, were demobilized. It did not appear that they would be included in the "interim force," nor in the permanent force, when it was formed. The term "interim force" was applied to the armed forces until Canada's military obligation under international authority might be known. The rehabilitation of the ex-servicemen and women was placed under the direction of the ministry of veterans' affairs. One phase of rehabilitation, university training, attracted 15,934 veterans.

The material contributions of Canada to the victory of the United Nations might be judged from the following figures. Contracts placed by the ministry of munitions and supply were \$10,500,000,000, the total commitment for the department, including financial provision for plant expansion, which was \$12,751,000,000. The resultant output included, 16,200 aircraft, 28,000 heavy naval and field guns, 1,500,000 rifles and machine guns, 100,000,000 rounds of filled heavy ammunition, 60,000,000 units of empty shell and cartridge cases, 4,440,000,000 rounds of small arm ammunition, more than 2,000,000 tons of explosives and chemicals, 800,000 automotive and armoured fighting vehicles, 8,000 ships and signal and communication equipment valued at more than \$500,000,000. The sale of war equipment was entrusted to the War Assets corporation. This body disposed of not only war equipment in the ordinary sense, but plants, machinery, etc., acquired by the government. A considerable amount of war material was disposed of to various European states, to the amount of \$11,000,000. The Netherlands government was the largest

purchaser, acquiring equipment for four divisions. By November, a total of \$613,000,000 of war assets was disposed. These weighty contributions were climaxed by the production of uranium for the manufacture of the atomic bomb. Canadian scientists, along with the scientists of other countries, collaborated on the production of the bomb. In the autumn of 1945, the Canadian government organized a number of survey parties to search for fresh supplies of uranium in the neighbourhood of Great Bear lake where the original deposits were found.

**Economic Survey.**—The year 1945 witnessed the commencement of the momentous and perplexing transition from war to peace. The certainties of rigid wartime demand gave place to the uncertainties of peace, which were intensified by problems of repatriation and rehabilitation of ex-service personnel, and by obscurity in the conditions of world trade. All these were thrown into clear relief when compared with the high level of economic activity in the previous year, 1944. In that year the index of the physical volume of business stood at 236.8 (the period, 1935-39=100). By the end of Jan. 1945, a decline was observable, when domestic export merchandise fell to \$230,498,000 from \$242,011,000 of Jan. 1944. Thereafter, the decline was steady, reaching its lowest point in September, when the index was 194.5, the lowest from Feb. 1942. During the first ten months of 1945, the average was 216.7.

**Agriculture.**—Agriculture reflected this general tendency. Cold weather and rains interrupted field operations and seeding. By midsummer it was accepted that the crop for the year would be below the long-term average, especially in the Prairie provinces. The official estimate for the wheat crop in 1945 was 308,600,000 bu. Other cereals were reduced proportionately: oats 378,300,000 bu., a reduction of 10,000,000 bu.; barley reduced by 4,900,000 bu. Nonetheless, the movement of grains to points outside Canada was heavy. By the end of the first week of July, 300,000,000 bu. of wheat and of wheat flour had left the Canadian ports. The urgent need of European countries for food explained this strong movement. As well, nearly every European state sought Canadian grain and vegetable seeds, alfalfa, timothy and red clover being in greatest demand. The carry-over of wheat was placed at 356,000,000 bu., the lowest from 1939, the year in which World War II broke out. The wheat board raised the export price from \$1.46 to \$1.55 a bu., and wheat was sold to the United Nations at this new rate. In crops other than cereals the output was approximately average, although the yield of orchard fruit was markedly light. The apple harvest was placed at about 7,500,000 bu. The potato crop was 35,184,000 cwt. (49,409,000, cwt., 1944). Livestock production was 7,500,000 head. Slaughtering totalled as follows: cattle 1,747,362; calves 768,427; hogs 5,477,325; sheep 1,133,980 during 1945. The need for foodstuffs in Europe drew heavily on Canadian supplies. This necessitated the resumption of the rationing of meat, and the observation of meatless days, Tuesdays and Fridays, in all public eating places. By these means the domestic consumption of meat would be reduced from 141 to 130 lb. per person. The gross value of field crops was estimated, as of December, to be \$1,098,859,000, a decrease of \$222,449,000 from the estimate of 1944. The estimated cash income of farmers was reckoned to be down \$62,000,000 in the first half of the year as compared with the same period in 1944.

**Mineral Production.**—Mineral production declined in a similar fashion. In all minerals the drop was 30% in the mineral production index from 1944. Metals used in war production showed an especially sharp decrease. The estimated steel production for 1945 was 2,836,000 tons; that of 1944, 3,024,000 tons. Gold receipts at the mint, and gold export fell by 13% and 15%, respectively.

**Communications.**—Railway transportation reached what might probably be regarded as its peak in 1945. The Canadian National railways reported a surplus of \$25,000,000, an increase of \$2,000,000 over 1944. Freight carried during the year was estimated at 79,900,000 tons; passengers 32,000,000; wages and pay roll \$221,520,000. Between V-E day and the end of the year, the railway carried more than 150,000 servicemen and women from vessels docking at the Canadian ports to their homes. In addition, it moved about 10,000 British troops from Vancouver to Halifax on their way from the orient. More than 600 special trains were required for service personnel, as well as extra sections for regular trains. Precisely comparable figures for the Canadian Pacific were not available; nonetheless, the accomplishments of this railway might be judged from the following: gross earnings \$318,084,000; revenue freight 55,220,951 tons; passengers 18,180,765. This summary was based on the period, Nov. 1944-Nov. 1945. During the war, more than 20,000 employees of the Canadian Pacific enlisted. The reconversion achievement of the railway was equally impressive. For example, only 60 days were required to change over the Ogden shops, Calgary, from all-out war production to the replacement and construction of locomotives. Canadian railways also assisted in the repatriation of United States servicemen, troops being brought over the Canadian lines to Montreal, whence they were routed to various points in eastern U.S. In the course of the year 1945, both railways added considerably to rolling stock, especially freight rolling stock. The Canadian National experimented with radio equipment looking towards the yard operation of trains by this medium. Both railways operated considerable fleets. While many of their vessels were still in war service, the Canadian National resumed its freight service to the West Indies, two of its 11 ships having limited passenger accommodation. The fleets of the two railways suffered heavily as a result of the war. Three of the five Canadian National liners were lost. The heaviest loss suffered by the Canadian Pacific was the "Empress of Britain," the well-known luxury liner. As well as rail, water-borne traffic in the Great Lakes basin was unusually heavy, owing to the unprecedented length of the season.

**Employment.**—Employment throughout 1945 presented a confused picture. In early midsummer, National Selective Service announced that in Ontario there were 46,550 vacancies with only 5,482 applicants. As late as August, it was estimated that the supply of workers was still about 100,000 short of jobs available. By late November, the situation was very nearly reversed, the department of labour reporting nearly 80,000 persons seeking work across Canada. The precise figure of unemployment is difficult to fix, but it appeared to have risen sharply during the autumn. Among veterans, the increase was marked by Nov. 28, when 1,300 were receiving out-of-work benefit; as of Sept. 1, this number was

725. While the situation was widespread, certain localities and certain lines of work were affected especially. The areas most severely affected were the extremes of east and west. In the east, Cape Breton Island, and in the west, Vancouver and the coast region were described as being "hit fairly hard." Those occupations most closely associated with war-time production suffered most. Efforts to maintain employment at war-time level were envisaged by the government. In April, a White Paper on employment was submitted to Parliament outlining a program which aimed to supply 960,000 more jobs than were available in 1939.

In August, the minister of labour announced the relaxation of controls over the movement of workers in order to facilitate the transition from wartime to peacetime employment. During the autumn, controls were progressively withdrawn. In September, the minister of reconstruction stated that there were in sight 1,000,000 more jobs than were open in 1939. In spite of this confused situation in the field of employment, strikes and industrial disputes were at a low level in the year 1945. In the first nine months of the year there were 143 strikes, involving 63,884 workers with a loss of 355,544 man-days. In the same period in 1944, comparable figures were respectively, 166; 67,533; 456,394. In the Cape Breton coal fields, a serious dispute was averted by the men's voting to accept a new two-year contract. The contract called for increases in pay and a two-week vacation with pay. The most extended strike of the year occurred in the Ford plant at Windsor, Ont., the issue being union-shop and check-off. After a 99 day stoppage of work, both parties agreed to accept an arbitrator, Justice I. C. Rand, of the supreme court of Canada (Dec. 20). Throughout the entire war period, Canada was remarkably free from serious labour disputes.

**Finance.**—Two Victory loans were floated during 1945, the Eighth and Ninth. Subscriptions to the latter loan, which closed in November, amounted to little less than \$2,000,000,000, the original objective being \$1,500,000,000. The number of applications for bonds in the Ninth loan was 2,546,569, as compared with 2,324,861 of the Eighth loan. A very substantial number of bonds was purchased by men and women returned from overseas. The success of the two loans in 1945 strikingly attested the well-being of the country at the end of six years of war. These loans, as well as the Victory loans of earlier years took a most important part in wartime finance, enabling the government to meet about 45% of its war expenditure from current revenues, thus implementing to a notable degree its announced policy at the outbreak of hostilities to put the cost of the war on "a pay-as-you-go" basis.

The cost of living index advanced slightly during the year. On the basis that the period, 1935-39=100, the index stood at 119.9 on Nov. 1. The increase was due entirely to a rise in the food index, especially in the price of butter and eggs. Other indices either remained stationary, or declined. (See also BUSINESS REVIEW.)

**BIBLIOGRAPHY.**—*The Canada Year Book, 1945; Canada at War; Bank of Montreal Business Summary; Agricultural and Industrial Progress in Canada;* Various publications of the Dominion Bureau of Statistics. (J. I. C.)

**Canadian Literature.** **Fiction.**—More than 100 books were published in Canada during 1945, making it the highest annual production up to that time. Most significant novel was Hugh MacLennan's *Two Solitudes*, a dramatic portrait and stiletto-pointed analysis of French Canada. *All This Difference* by Dorothy Dumbrell also examined the French-Canadian scene. The 1945 Ryerson fiction award was divided by Philip Child's *Day of Wrath*, a study of dictatorship in Germany, and Will R. Bird's *Here Stays Good Yorkshire*, an historical novel of Yorkshiremen who settled in Nova Scotia in 1772. Violet King's *Better Harvest* also chose an historical theme, the 1837 Rebellion in Ontario. *Darkly the River Flows* by Lt. Comdr. John Macdonald, R.C.N.V.R., winner of Longmans, Green \$1,000 book prize, was a character study in a modern Ontario setting. Two Canadians naturalized in the United States published important novels: Thomas B. Costain's *The Black Rose* had England and China in the 13th century for its background, while Robert Fontaine's *The Happy Time* recalled his boyhood in Ottawa. Three collections of short stories were published: *So Near Is Grandeur* by Leslie Gordon Barnard, *Tambour* by Thomas H. Raddall, *The Village of Viger* by Duncan Campbell Scott. Other novels were: *Turf Smoke* by John Coulter, *The Shadow of Tradition* by C. H. MacGillivray, *Blow Wind—Come Wrack* by John Wentworth (pseudonym of Philip Child), *Winter Reason* by Evelyn Eaton, *Her Own People* by Grace Tompkinson, and *Fireweed* by Frances Sarah Moore.

**Poetry.**—Most significant single poem was Dr. E. J. Pratt's *They Are Returning*, a salute to Canada's fighting forces. Major Earle Birney, governor-general award winner in 1943 (*David And Other Poems*) described in *Now Is Time* what the war meant to a Canadian soldier. Anne Marriott, another poetry governor-general award winner (*Salt Marsh*: 1941) also pub-

lished a collection of poems, *Sandstone. Tallahassee* by Andrew Merkel was a long narrative poem about the maritime provinces during sailing-ship days. *Overture* by F. R. Scott was a collection of poems of social content, marked by satire and irony. Other collections of poems included: *True Harvest* by Arthur S. Bourinot, *From Dawn to Dusk* by Helen Fairbairn, *A Tent For April* by Patrick Anderson, *Here and Now* by Irving Layton, *Moths After Midnight* by Vere Jameson, *Songs of the Western Islands* by Hermia Harris Fraser, *And in Time of Harvest* by Monica Roberts Chalmers, *Sea-Woman* by Eileen Cameron Henry, *Wood-Fire and Candle-Light* by Mary S. Edgar, *When I Turn Home* by Dorothy Howard.

**Nonfiction.**—Reader-interest centred on the nonfiction war books written by Canadians in 1945. *Gauntlet to Overlord* by Ross Munro told the story of the Canadian army in action. *Escape From Arnhem* by paratrooper Leo Heaps was a first-hand account of the battle of Arnhem during the latter days of World War II. Edgar McInnis added *The War: Fifth Year* to his annual survey volumes on the progress of World War II. *Saints, Devils and Ordinary Seamen* by Lt. W. H. Pugsley, R.C.N.V.R., was the human-interest story of Canada's navy in action. In *Wings of the Morning* Jean Brown Segall told her brother's experiences and sacrifice with the R.A.F. A fugitive for 18 months from the Japanese in the Philippines, Louise Reid Spencer described the experience in *Guerrilla Wife*. Other war books were *Germany's War Crimes And Punishment* by M. H. Myerson, *Hi-Sky!* by Alec McAlister, and *Sailors* by Grant Macdonald.

Publication of an unusual number of regional books marked Canadian literature of 1945. *We Keep a Light* by Evelyn Richardson described the tribulations of lighthouse living on an island off the tip of Nova Scotia. *The Castle Buck* by Phil H. Moore reported hunting and fishing in Nova Scotia. *A Saga of the St. Lawrence* by D. D. Calvin reported timber and shipping through three generations along the St. Lawrence river. *Grand River* by Mabel Dunham told the story of the coming of the Mohawk Indians to that Ontario region. *Three Mile Bend* by Kerry Wood was a collection of humorous sketches about wild life in an Alberta valley. Two books of pictures also told the story of Canada: *This Is Canada* by Donald W. Buchanan, and *Outdoors With a Camera in Canada* by Dan McCowan.

Other topics were history, current affairs, science, arts, religion, biography and autobiography. Lawrence J. Burpee retold *The Discovery of Canada* in the words of the discoverers themselves. Dr. Lorne Pierce made a passionate plea for Canadian unity in *A Canadian People. The Spirit of Canadian Democracy* by Margaret Fairley was an anthology of Canadian democratic writing for the past 200 years. *The Voice of Dafoe* was a selection of editorials by John W. Dafoe, great Canadian journalist who died in 1944. In *Left-Turn*, Canada Major James W. Coldwell spoke for socialism, and in *While There Is Yet Time* Stephen Leacock spoke posthumously against socialism. Art books were *Painting in Canada* by Paul Duval, *The Arts and Crafts of Canada* by Douglas G. W. McRae and *The Group of Seven* by Thoreau MacDonald.

Biographies were *Frederick Philip Grove* by Desmond Pacey, *C. W. Jefferys* by William Colgate, *Emily Murphy—Crusader* by Byrne Hope Sanders; while *Brave Harvest* by Kennethe M. Haig was the life story of E. Cora Hind, famous Canadian woman agricultural journalist. In *The Stream Runs Fast* Nellie McClung, noted Canadian novelist and inspirational writer, continued her autobiography.

**Juvenile.**—Several juvenile books appeared. Prolific William MacMillan published three novels for older boys—*Arctic Adventure*, *Dark Treasure* and *Mystery Ship*. *Windigo* by Kathrene Pinkerton was a girl's novel about northern Ontario. *Wild*

*West Bill Rides Home* by M. F. Millen described ranch life in Alberta. Louise Richardson Rorke continued the story of a Colie dog in *Lefty's Adventure*. Ray Darby and John Phillips, writer and artist, combined to produce three books during the year—*Peter Smith And the Bugs*, *Peter Smith And the Sky People* and *Oomah*. Dorothy Morrison wrote *Tales The Eskimos Tell* and Marjorie E. Cropp wrote *The Tremendous Adventures Of The Peace Fairy*. Mary MacIntyre wrote 43 short stories about words under the title *Skippy and Others*.

(C. Cy.)

**Canadian-U.S. War Committees.** With the exception of the Permanent Joint Board of Defense, all Canadian-U.S. war committees were expected to be dissolved by the end of the calendar year 1945. On Aug. 17, 1940, 11 months after Canada declared war on Germany, President Roosevelt and Prime Minister King signed the Ogdensburg agreement, which brought into being the Permanent Joint Board on Defense. As a result of the Hyde Park declaration of April 1941, which recognized the need for further measures to co-ordinate the productive facilities of both countries if the utmost aid was to be given to the United Kingdom and the other democracies, the Material Co-ordinating committee, the Joint Economic committees, and the Joint War Production committee were established. The Joint Standing Committee on Agriculture and the Joint War Aid committee were not set up until March and Aug. 1943, respectively.

**Permanent Joint Board on Defense.**—As the name implies, the board which was established in Aug. 1940, was expected to continue on a permanent basis, and during the last quarter of 1945 it met every two months instead of every three months as it did during the war. The over-all plans for the defense of North America were drawn up by this board and implemented by the two governments. Recommendations of the defense board resulted in the building of the Alaska Military Road, the construction of a chain of air fields between Edmonton and Alaska, and construction and other operations in Labrador, Newfoundland and Alaska by United States and Canadian civilian and military forces. The United States and Canada continued in 1945 to co-operate on joint defense measures against any future attack, particularly across the arctic regions. The United States assigned six observers to accompany "Exercise Musk-ox," the Canadian army and air force expedition which was to make a 3,100-mi. expedition through the arctic early in 1946 to gather information on possible military operations in that region. The expedition was to be supplied by air. The air forces expected to obtain vital information on polar operations and the ground forces were to gather data on equipment needed in the arctic area. U.S. officials were also supporting the Arctic institute at McGill university in Canada, which was studying problems of existence in the arctic. There were six United States members representing air, ground and navy forces, with one member from the department of state and a civilian chairman. There were five Canadian members representing air force, army and navy, with one member from the department of external affairs. The board acts in a recommending capacity only.

It was understood that the United States and Canada had co-operated closely in liquidating their joint wartime ventures, particularly the air route between the U.S. and Alaska and the installations connected with it. The highway sections linking Alaska and the U.S. were to be taken over by Canada on April 1, 1946, and the telephone lines on June 1. By the end of 1945, Canada had paid for every permanent air facility installed by the U.S., and the United States had not requested

any bases on Canadian soil. In view of the mutual confidence between the two countries, it was believed that a comprehensive defense program could be worked out in any emergency.

**Material Co-ordinating Committee.**—This committee had ceased operation and was expected to be dissolved by Dec. 31, 1945. It was set up in May 1941 to plan the over-all raw material supply and requirements position of the two countries and to iron out distribution problems arising from short supply.

**Joint Economic Committees.**—Establishment of these committees was announced June 17, 1941. They were to harmonize economic controls, priority regulations, shipping problems, questions of tariff, duties and exchange, and generally to mesh production in both countries for the most effective prosecution of the war. They were dissolved in March 1944, when it was apparent that other agencies had taken over most of their functions.

**Joint War Production Committee.**—This committee had actually gone out of existence although no official dissolution date had been announced up to Dec. 1945. This committee was first set up as the Joint Defense Production committee by President Roosevelt and Prime Minister King in Nov. 1941 pursuant to an earlier recommendation of the Joint Economic committees. The objective of the committee was to integrate and speed up munitions production in both countries. It was successful in reducing duplication, increasing the exchange of technical information, closing short-term gaps and in rationalizing production to take advantage of the best facilities available in both countries. There were ten technical subcommittees which did the basic ground work for the committee. These expert bodies covered aircraft, artillery, artillery ammunition, conservation, chemicals and explosives, small arms and small arms ammunition, naval shipbuilding, merchant shipbuilding, signal corps equipment and tank automotive.

**Joint Standing Committee on Agriculture.**—This committee was inactive after Oct. 1943 when full membership on the Combined Food board was extended to Canada. Most of the functions of the committee were absorbed at that time by the Food board. The committee was originally set up in March 1943 to keep in constant review agricultural and food production and distribution in the light of war and civilian needs at home and in liberated areas.

**Joint War Aid Committee.**—Since the purpose of this committee was to study problems arising out of the operations of the United States lend-lease and the Canadian Mutual Aid programs, its operations may be said to have ended with the termination of these programs early in Sept. 1945. Its formation was announced by President Roosevelt and Prime Minister King during the Quebec conference in Aug. 1943. (See also BRITISH-U.S. WAR BOARDS.)

(W. E. TH.)

**Canals and Inland Waterways.** The principal canals and inland navigable waterways of the United States include the Great Lakes, the Mississippi river system, the Illinois waterway, the New York State Barge canal system, the Cape Cod canal, the Chesapeake and Delaware canal, the Atlantic Intracoastal waterway extending from New Jersey to the Florida keys, the Gulf Intracoastal waterway extending from Florida to the vicinity of the Mexican border, the San Joaquin-Sacramento river system in California, and the Columbia river system in the northwest.

The Great Lakes, which consist of lakes Superior, Michigan, Huron, Erie and Ontario, have natural deep water except in the connecting channels which have been artificially deepened where necessary to accommodate deep-draught vessels. They have an outlet to the Atlantic ocean via the St. Lawrence waterway and

via the Oswego and Erie branches of the New York State Barge canal system and Hudson river.

The Mississippi river waterway system embraces the river proper, the Red, Arkansas, Missouri, Illinois, Ohio, Tennessee, Monongahela, Allegheny and Kanawha rivers and other streams. The Mississippi river has a channel for ocean-going vessels upstream to Baton Rouge, La., and thence a channel for modern barge navigation to Minneapolis, Minn., and in its principal tributaries. In the 650 mi. of river above Alton, Ill., to Minneapolis, a system of low-head dams with locks provides a 9-ft. channel depth adequate for modern barge navigation, and below Alton the channel is maintained by open river works. The Ohio river and certain of its improved tributaries are also canalized to provide a 9-ft. channel for barge navigation serving this highly industrialized region. The system of six locks and dams on the Ouachita and Black rivers provides depths of 6½ ft. at low water from the Red river to Camden, Ark., a distance of 351 mi. The Red river proper and the Arkansas river have been improved for light-draught navigation throughout a total length of more than 1,000 mi. The Illinois river and waterway to Lake Michigan has a barge channel which connects the Great Lakes with the Mississippi river system. The Mississippi river inland waterway system, together with the Intracoastal system, which it connects at Plaquemine and New Orleans, La., brings barge navigation within reach of important industrial and farming centres.

The Cape Cod canal which extends from the head of Buzzards bay, Mass., to Cape Cod bay and the Chesapeake and Delaware canal between the Delaware river and Chesapeake bay are sea-level waterways, affording a protected and shorter route for coastwise ocean-going vessel traffic.

The Atlantic and the Gulf Intracoastal waterways provide a protected channel for barge and other light-draught navigation

following coastal sounds, bays, rivers and artificial channels. This canal system, extending for more than 2,300 mi. along the Atlantic and Gulf coasts, affords a channel 12 ft. or more in depth throughout the Atlantic coast section from Trenton, N.J., to Jacksonville, Fla., and in the Gulf coast section from Carrabelle, Fla., to Corpus Christi, Tex.

The San Joaquin-Sacramento river system, with an outlet to the sea through San Francisco bay, has a deep-draught channel to Stockton, Calif., on the San Joaquin river and a moderate-draught channel to Sacramento, Calif., on the Sacramento river. The Columbia river affords a channel for ocean shipping to Portland, Ore., and Vancouver, Wash., and depths suitable for commercial vessel traffic to the head of the pool formed by the Bonneville dam, and thence depths for barge navigation upstream to and including the Snake river.

These systems of inland waterways were maintained and operated to provide for commerce and traffic of importance to the war, including the movement of newly built war vessels from inland yards to the sea.

During the fiscal year ended June 30, 1945, the two flood-gates at the Colorado river, Texas, crossing of the Gulf Intracoastal waterway, were completed. Dredging was undertaken in the section of the waterway between Galveston and Corpus Christi, Tex., to provide the authorized depth of 12 ft., involving the removal of some 7,000,000 cu.yd. of material. Preliminary work was accomplished toward providing the authorized extension of the waterway below Corpus Christi to the vicinity of the Mexican border.

Work was resumed on the construction of additional open river regulating works to improve the navigation channel in the middle Mississippi river between the mouth of the Ohio river and the mouth of the Missouri river, and also in the Missouri river below Sioux City, Ia.

During the year work was initiated on the extension to the

A VIEW of the 37-mile Madera canal, which was completed in June 1945, as part of the Central Valley project of the U.S. bureau of reclamation in California

Southwest pier and reconstruction of Brady pier in the St. Mary's Falls canal, Michigan. The Great Lakes harbours and connecting channels were maintained as required for the needs of commerce.

The water-borne commerce of the United States, Puerto Rico, Alaska and the Hawaiian Islands for the calendar year of 1944 aggregated 605,928,000 tons. A total of 135,172,179 tons was carried on the Mississippi river and its tributaries, and 116,985,667 tons moved through the St. Marys Falls canal connecting Lake Superior and Lake Huron.

The River and Harbor act of March 2, 1945, authorized the improvement of various inland waterways throughout the United States. These new projects included a 12-ft. channel in the Intra-coastal waterway from Jacksonville, to Miami, Fla.; the improvement of the Apalachicola, Chattahoochee and Flint rivers, Georgia and Florida; and the development of the Alabama and Coosa rivers and tributaries, Alabama and Georgia, for navigation, flood control, power development and other purposes. The Neches and Angelina rivers, Texas, the Guadalupe river, Texas, and the Trinity river and tributaries, Texas, were authorized to be improved in the interest of navigation, flood control and allied purposes. Also, the above-mentioned act provided for the improvement of the Mississippi river between the Ohio and Missouri rivers; the Illinois waterway, Illinois, and Indiana Harbor canal and harbour, Indiana; and the Missouri river between Sioux City, Ia., and the mouth. For the northwest region, the congress authorized the construction of dams and open channel improvement for the purpose of providing slack water navigation on the Snake river, Oregon, Washington and Idaho; and the construction of the McNary (Umatilla) dam for purposes of navigation, power development and irrigation in the Columbia river, Oregon and Washington. (R. A. Wr.)

**Europe.**—Continuation of hostilities in Europe in 1945 militated against any important developments in canal construction in the eastern hemisphere. Such activities as were possible during the latter half of the year after the defeat of Germany were directed entirely to repairing the serious havoc wrought in the preceding months and years of the war, and by the autumn much progress had already been achieved. To mention one instance out of many, the Dortmund-Ems canal, which was much bombed by Allied airmen on account of its importance to inland transport in Germany, was receiving concentrated attention, and was expected to be once more in full commission by the end of the year. The Rhône and Kiel canals by September were already open to traffic.

As regards other waterways on the continent, it can only be said in general terms that no effort was being spared to restore them to their former efficiency for traffic. Among items of general interest may be mentioned the attainment in 1945 by the Kronstadt-Leningrad ship canal of its diamond jubilee.

**Great Britain.**—There were no important constructional developments during 1945 on British canals. The main movement was a change-over from horse haulage to motor-driven craft, a trend which would be pursued with great vigour as soon as boat builders and engine manufacturers received adequate supplies of labour. Much attention was devoted to consideration of a postwar policy for British canals, and on April 19 the canal joint committee, comprising representatives of the Canal association and the National Association of Inland Waterway Carriers, issued a statement outlining proposals whereby it was hoped that the inland waterway industry would be able to contribute more effectively to the general scheme of inland transport in Great Britain. The statement recommended that waterways regularly used for the carriage of traffic be restored and maintained so as to provide an adequate navigable channel for the largest craft loaded to maximum draft in current use on the respective waterways. It was stated that further bank protection was needed to enable power-driven craft to operate efficiently; also that some narrow or low bridges still caused obstruction and that a number of locks required improvements. Perhaps most important as regards the prosperity of the industry, the statement advocated a correlated rates structure, or standard system of charging for different forms of transport which would be both economic and of general application. (See also AQUEDUCTS.)

FILMS.—*Canals of England* (Encyclopædia Britannica Films Inc.). (B. Cu.)

**Cancer.** **Experimental Production of Cancer.**—The occurrence in human beings of extremely complicated malignant tumours, composed of a complex of tissues foreign to the organ in which the cancer occurs, has long been observed. The explanation offered has been that these growths are derived from remnants of rudimentary tissue of one type or another left during the early period of embryonic life. On occasion

these growths are extremely complex and may contain portions of organs which under ordinary conditions never form cancer. Verification of the idea that these are remnants had been repeatedly attempted by injection of hashed-up embryos into the ordinary laboratory animals of the same race and strain, but except in rare instances no tumours have been formed. Several portions of tissue may grow, quite frequently cartilage or epidermis, but after a short period this tissue is again absorbed and no tumour follows. Peyton Rous in a series of ingenious experiments answered this question. He implanted under the skin of mice fragments of mouse embryos which were treated with small quantities of carcinogenic chemicals. Malignant tumours were obtained after a moderate lapse of time which were of the type which regularly come from the epithelial cells of the skin and various internal organs of adult human beings. A large number of tumours of many different varieties was thus obtained, which showed that embryonic tissue was perfectly capable of forming carcinomas and sarcomas in adult animals if given the proper stimulation.

**Cancer Research.**—In studying methods of application for some of the highly carcinogenic hydrocarbons, *e.g.*, methylcholanthrene, W. Cramer and his co-workers discovered that when carcinogen was dissolved in anhydrous lanolin instead of the usual solvents, such as benzol or acetone, cancer of the skin did not appear as would be expected. In other words, the lanolin in a sense had a protective action. The skin was not greatly damaged by the lanolin-carcinogen applications; there was no falling of the hair, destruction of the sebaceous glands, or hyperplasia of the superficial epidermal layer. However, some biological change did occur. After a prolonged series of these applications, although no morphological or chemical changes could be detected in the skin, this particular skin area, nevertheless, responded very promptly to painting, with a benzol or acetone solution of methylcholanthrene, by producing a carcinoma.

The production of a cancer may also be noted after a painted area has been burned or otherwise injured so that a chronic inflammatory process is set up. It is interesting to note that this is exactly what occurs in human beings. Extensive skin burns which are seen in children, scalded by hot water or caustic lye, never become cancerous during childhood. In adult life cancer does not appear in such an area unless there has been an injury to this burned skin which remains for some time, generally months or years, unhealed. In other words, the burn is not directly responsible for the appearance of a cancer, it merely reduces the nutrition of the tissues so that they will not heal after an injury. Any inflammatory and reparative processes which go on in such an unhealed area probably account for a spontaneous mutation of the cell or cells with the production of a cancer. Thus experimental study confirms what has long been known from practical experience.

**Therapy.**—When the extraordinary therapeutic value of penicillin in treating many infectious diseases was demonstrated, it was inevitable that the substance would be investigated to see if it had any destructive power on the cells of malignant tumours. Some rather inconclusive reports hinted at the possibility that it might be of some value, but a very careful study by Gey and his collaborators showed there was no evidence that penicillin had any destructive power on either normal or cancer cells growing in tissue cultures. Others have shown that it possessed no value in the treatment of tumours in the living animal, and a few physicians have tried it on advanced cancer cases, also without benefit.

**Radiation Treatment.**—The war greatly interfered with certain lines of investigation which were in active prosecution some years ago. The use of various atomic breakdown products

and artificially produced radioactive material was impeded by the employment of cyclotrons, otherwise free to make artificial radioactive agents, for the needs of the research staff of the atomic bomb group. A few reports were still being made on the use of radioactive phosphorus in the treatment of leukaemias and similar conditions, but on the whole the results were not very encouraging because the substance was not controllable. If a radioactive substance is injected into a patient's veins and he reacts unfavourably, nothing can be done, whereas if a patient is treated with X-ray, the dose given should never be large, and the X-ray should be very slowly administered in order to ensure careful control over the destructive effects of radiation. That is, radiation with either radium or X-ray is much more flexible, and the fact that rays from radium correspond to about 2,500,000 volts gives the physician control of an ample range of wave length. No differences were observed experimentally between radium rays and X-rays when the measurements of both agents were made in comparable units. One unit of X-ray produced at 50,000 volts is no more and no less effective in killing a cell than one produced by 1,000,000 or 2,000,000 volts. The only difference lies in the physical distribution of the intensity of radiation.

A warning note concerning these matters was published by J. H. Lawrence, whose wide experience gave great weight to his opinion. He called attention to the fact that some unwarranted enthusiasm had been noted, especially in those with the least experience, and stressed that too little attention had been given to the possibility of harmful late effects. He referred to aplastic anaemias and osteogenic sarcomas which developed many years after the swallowing of radioactive material. Obviously in treating a disease like leukaemia with radioactive phosphorus these late possibilities are less important, because the patient with this disease is not likely to live more than five or six years and therefore runs no risk of the development of a bone sarcoma. Almost all published cases required a longer period than that to show tumour development. On the other hand, the impossibility of controlling the effects after injection into the blood stream may lead to extremely embarrassing situations in which it is evident that the patient's life has been shortened by this treatment. Despite such warning notes the daily press continued to announce that advances in atomic knowledge had been so great it seemed probable that cancer and similar diseases would soon be under control.

**Castration Therapy.**—Dr. Frank E. Adair and his colleagues analyzed the results of castration treatment of cancer of the breast in 342 persons, seven of whom were men. The results were not particularly encouraging. A certain amount of improvement was noted in a little more than 10% of the patients. On the whole, the men exhibited better results following castration than the women. It was not possible to prophesy results in any individual patient. Of course, after failure to cure prostatic cancer by this treatment no better results could be expected on the breast; in fact, they were not nearly so good. The effect of X-ray on carcinoma of the breast varies so extraordinarily from individual to individual that it is almost impossible to say that the good results authors obtained in any case resulted from castration. With X-ray alone it is sometimes possible to prolong the life of a patient with fairly extensive bone metastases for four or five years; although others, with apparently perfectly similar morphology of the tumour and the same quality of surgery, will die in a few months despite the heaviest kind of radiation. It would seem the only position that can be taken is, if a patient wishes to undergo the discomforts of castration, either by surgical methods or by radiation, to grant this desire. On the other hand, it is altogether unjustifiable to recommend castration to a patient as in any way pro-

longing life or mitigating pain. (See also BIOCHEMISTRY.)

**Candy.** Approximately 2,700,000,000 lb. of candy, with a wholesale value of about \$640,000,000 was produced in the United States during 1945. This compared with 2,804,000,000 lb., valued at \$658,000,000, manufactured and sold in 1944.

For the second year in the history of the candy industry (1944 was the first), bar type candies, 90% of them five-cent items, represented a greater portion of the national candy supply than the combined volume of all other types of candy. Bar goods constituted more than 52% of both the tonnage and dollar value of all candy made and sold in 1945. Continuing the trend, a notable increase was also shown in fancy packages and in over-the-counter sales of manufacturing retailers' establishments. A sharp decrease was recorded in penny goods. This type of candy accounted for less than 5% of the total volume whereas in the depression years of the '30s one-cent items represented one-fifth of the candy volume.

About 20% of the total 1945 candy tonnage was shipped to the armed forces in the United States and abroad. During the first half of the year, most of the bar goods manufacturers devoted from a third to one-half of their production for army and navy use, but sharp curtailments of government buying were recorded after V-E and V-J days. A 50% set-aside order was in effect on five-cent bar goods during the first quarter of 1945, while in the last half of the year, the quartermaster was entirely "off-the-market" insofar as new candy purchases were concerned. Post exchanges and navy supply depots continued to buy candy throughout the year. Candy, in the form of bars, solid chocolate, fudge, caramels, jelly drops, hard candy and sugar-coated peanuts, was among the varieties used in 1945 in the following rations: ten-in-one, K, C, D, air crew lunch, life boat and parachute.

The industry's 1945 tonnage was produced by approximately 1,300 candy manufacturers in Chicago, Philadelphia, New York, Boston, Minneapolis, San Francisco and other sections of the country, employing 50,000 persons, mostly women. Illinois, the largest candy manufacturing state, accounted for more than one-fourth of all confectionery produced in 1944. Pennsylvania was second, with New York and Massachusetts as runners-up. In addition to the near-record domestic production, the 1945 candy supply included about 50,000,000 lb. of imported candy, most of which came from Cuba. In prewar years, however, big candy imports came from Germany, Russia, the Netherlands, France and other continental countries. The per capita consumption of candy in 1945 was 19 lb., compared with 20.5 lb. in 1944. The per capita consumption of candy in Great Britain in the same year was 22 lb. According to a department of commerce survey, however, U.S. consumers would have bought 700,000,000 lb. more candy in 1945 had supplies been available. The average value of candy in 1945 was 24 cents per lb., compared with 23.5 cents per lb. in 1944.

To produce the 1945 volume, the candy industry used nearly \$287,000,000 worth of ingredients, divided approximately as follows: cane sugar 823,000,000 lb.; beet sugar 284,000,000 lb.; corn syrup 722,000,000 lb.; milk 425,000,000 lb.; chocolate coating 244,000,000 lb.; peanuts 223,000,000 lb.; nuts 50,000,000 lb.; corn sugar 36,000,000 lb. and fruits (mostly cherries, figs and raisins) 10,000,000 lb.

For the fourth year in its history, the candy industry in 1945 met sharp curtailments in ingredients, particularly sugar and chocolate. The sugar ration for the first quarter was 70% of base period use; 65% for the second quarter and 50% for the last six months. The chocolate ration was about the same, although cocoa bean grinding quotas were set at 70% for the first nine months and 85% for the final quarter.

The confectionery industry continued in 1945, with the aid of the U.S. department of agriculture, a research development program begun in 1943, the purpose of which was to find greater use for soybeans, cottonseed and other home-grown agricultural production in the manufacture of candy. The industry also continued a co-operative \$500,000 a year consumer advertising program. (H. D. G.)

**Cane Sugar:** see SUGAR.

**Canning Industry.** United States and territorial canned food production in 1945, including canned vegetables, fruit, fish and milk totalled about 490,000,000 cases as compared with 480,000,000 in 1944. At the beginning of 1946, statistics on the previous year's pack of meat products were not available. However, in addition to production for the civilian market, considerable quantities of meat products and special rations were canned for the armed forces.

Preliminary statistics for the major commodities in 1945 are compared with 1944 in the table in terms of standard cases.

Preliminary Statistics for Major Commodities, 1945 and 1944

	1945 Cases	1944 Cases		1945 Cases	1944 Cases
Fruits . . .	51,000,000	56,000,000	Specialties,	68,000,000	70,000,000
Fruit Juices .	65,000,000	63,000,000	fruit and		
Vegetables	200,000,000	190,000,000	vegetable .		
Milk . . .	90,800,000	82,200,000	Fish . . . . .	17,600,000	18,375,000

In view of increased government requirements, the canning industry was requested to pack in 1945 quantities of fruits and vegetables well in excess of the 1944 packs. This increased production goal was designed to satisfy as nearly as possible all the civilian and government requirements for canned foods. Shortly after the cessation of hostilities, government purchases of canned foods were sharply reduced, resulting in substantially larger quantities being available for the civilian market than had earlier been anticipated.

The maximum price and subsidy programs continued in effect throughout the year. These 1945 programs followed the same general outline as in 1944. The rationing program on canned fruits, juices and vegetables was ended the middle of August, immediately upon the ending of hostilities, while rationing of canned meat and fish was discontinued later in the year.

The tin supply and its collateral effect on the availability of metal containers for foods remained critical at the end of 1945. Shortly after the surrender of Japan both the British and Netherlands governments sent missions to the far east to make a study of conditions in liberated tin-producing sections. According to the Reconstruction Finance corporation, about 4,500 tons were located in Malaya and about the same quantity in Siam. It was also known that there were certain stocks of concentrates in those countries. However, it was emphasized by the War Production board that the end of the war did not in-

COMMUNITY CANNING centre at Frisco City, Ala., where a schoolgirl heats carrots before sealing the cans. The carrots were bought by the department of agriculture under its price-support plan and given to the school lunch program

crease the amount of tin available to the U.S. but, rather, it increased the number of claimants for the already meagre world supplies.

In Nov. 1945, conservation order M-81 was amended to permit unlimited tin for 153 kinds of canned foods. The amendment set up no packing quotas, as did the previous amendments, but it continued certain restrictions on the can sizes and the can materials that canners may use. The packing of pet foods was still restricted under the order. At the end of 1945, further liberalization of tin quotas for canned foods was expected through new amendment to conservation order M-81.

**Canol Oil Project:** see NORTHWEST TERRITORIES.

**Canton Island:** see PACIFIC ISLANDS, U.S.

**Cape Verde Islands:** see PORTUGUESE COLONIAL EMPIRE.

**Carbon Black.** Unprecedented demand for the compound- ing of synthetic rubber caused sharp increases in the production of carbon black in the U.S., most of which was concentrated in 1944. Deliveries to rubber companies in 1944 took 390,230 short tons, an increase of 56% over 1943, and 95% of the domestic sales. The salient data of the industry during the war years are shown in the table.

Production continued to increase in 1945, but demand was so consistently ahead of production that in February the War Production Board reduced the average permissible carbon black content of rubber about 10% below the average of 950 lb. per ton that had been used in 1944. In March arrangements were made to increase production. In May, following the German surrender, army cutbacks in rubber requirements, coupled with the increased output, brought supply and demand into approximate balance for the first time in two years, and in June the emergency restrictions of February were cancelled. The surrender of Japan made still further reduction in military demands, and made greater supplies available for civilian use.

Postwar prospects for the industry depended on the rate at which natural rubber could be brought back into production and use, and on the degree to which it was deemed advisable to keep synthetic rubber plants in operation as a safeguard against possible future shortage of natural rubber. While synthetic rubber uses 950 lb. of carbon black per ton, natural rubber requires only 460 lb.

Data of Carbon Black Industry in the U.S., 1940-44  
(Short tons)

	1940	1941	1942	1943	1944
Production . . . . .	284,396	297,033	287,003	296,711	400,930
Year-end stocks . . . . .	84,794	59,429	121,378	102,108	34,622
Total sales . . . . .	264,887	322,372	224,966	314,650	468,715
Export sales . . . . .	88,809	74,083	57,818	52,456	78,476
Domestic sales . . . . .	176,078	248,290	167,148	262,194	390,239
Rubber . . . . .	155,090	219,751	147,974	236,737	369,015
Ink . . . . .	12,079	19,099	9,616	11,765	12,239
Paint . . . . .	3,403	2,920	1,808	1,972	2,658
Other uses . . . . .	5,506	11,520	7,750	11,720	6,327
Natural gas used* . . . . .	368,802	365,377	335,533	315,562	355,570
Average yield† . . . . .	1.54	1.63	1.71	1.88	2.20
Average value‡ . . . . .	2.90	3.26	3.41	3.41	3.67

\*Millions of cubic feet. †Pounds per thousand cubic feet. ‡Cents per pound.

At the end of 1945 plant capacity was expected to be 725,000 short tons annually, of which 100,000 tons was government owned. Some of the added war capacity was in plants where high costs of operation would prevent production under normal conditions. Even after these deductions, there was ample capacity for any probable postwar needs, indicating a period of sharp competition.

It is to be noted that while the war period was one of increasing costs, as measured by a rise of 27% in the average value per pound, the cost increase was more than offset by a 43% increase in the yield. At the same time new techniques were developed in the use of carbon black in rubber, which improved the product and reduced the cost. (G. A. Ro.)

**Carnegie Trusts:** see SOCIETIES AND ASSOCIATIONS.

**Caroline Islands.** A widely scattered archipelago in the North Pacific, administered by Japan under a League of Nations mandate, included in Micronesia and lying between 5° and 10° N. and 135° and 165° E. The total land area is about 380 sq.mi., and of this 307 sq.mi. is covered by the four main islands, Ponape, Kusaie, Truk and Yap. Pop. (Japanese est. of 1939) 54,944, distributed between the four administrative districts as follows: Palau 18,957, Ponape 12,922, Truk 18,838, Yap 4,227. The seat of administration for all the Japanese South Sea islands is on the island of Corrol, in the Palau group. Aeroplane service between Tokyo and Palau was established during the 1930s.

**History.**—A Japanese naval force occupied the islands in 1914 and Japan obtained the group as a mandate from the League of Nations after World War I. Information about the islands from Japanese sources became increasingly scanty and visits from foreign vessels were not welcomed. A few foreigners, including the writer and correspondent, Willard Price, visited the islands in the '30s. In violation of the terms of the mandate, Truk was developed as a major naval base.

Truk, although heavily bombed by U.S. planes in Feb. 1944 and on other occasions, was by-passed in the main U.S. offensive against Japan, which proceeded from the Marshalls (*q.v.*) to the Marianas (*q.v.*) and the Philippines and thence to Iwo Jima and Okinawa. In the Carolines, as in other outlying islands, Japanese garrisons held out until the surrender in Aug. 1945, living on the scanty fare of the islands, supplemented by occasional supplies sent by submarine.

The Carolines are composed largely of volcanic rock and the highest peak on Ponape reaches an elevation of about 3,000 ft. There are no navigable rivers. Angaur, in the Palau group, is called the treasure island of the group because of its large deposits of phosphate. It was connected by a steamship line with Menado, in Celebes, and Davao, in Mindanao, of the Philippines.

The Yap group, where some of the more primitive natives live, is a centre of cable communication, as submarine cables from various directions meet there. The Ponape group, some 400 mi. E. of Truk, is interesting to archaeologists and anthropologists because of the ruins of a mighty city, built of huge

blocks of rock. Its origin is veiled in mystery, as there is no indication that the islands could have ever supported a large population.

A branch of the industrial experiment station of the islands was opened on Ponape in 1925 to make trial plantings of rice and medicinal herbs. Copra, however, remains the leading export product of the Carolines, together with the phosphate on the island of Angaur. The output of this phosphate in 1937 was 134,098 metric tons, valued at 3,533,606 yen.

The main islands are of considerable elevation and are surrounded by low coral islets. The climate is generally equable and moist, but the islands are subject to occasional tropical hurricanes. The vegetation is tropical and luxuriant. Open ports in the Carolines before World War II were Palau, Angaur and Truk. Almost all the overseas trade of the group was with Japan.

**Education, Religion, Health.**—Some schools are provided for the natives, but attendance is not compulsory. There is a dormitory system for children from remote regions. The regular Japanese system of compulsory elementary education for six years was extended to cover Japanese children in the Carolines. There are ten church schools in the Carolines, six in Truk, two in Palau and two in Ponape.

There was some Christian missionary activity in the islands under the Spanish, German and Japanese regimes. Under Spain it was exclusively Catholic. There was German and American mission activity, both Protestant and Catholic. The Japanese sent Christian, Buddhist and Shinto missionaries.

The Carolines are not as unhealthy as some tropical regions, but are subject to some diseases. Influenza often breaks out with the shifting of the trade wind, which brings a change in climate. Amoebic dysentery, framboesia and dengue are endemic diseases. A cause of the spread of disease is the shortage of water, rainwater tanks often being used and proving an agency for spreading sickness. The Japanese authorities enforced precautions, including vaccination, against contagious diseases. The native population is generally attached to primitive customs and is not very responsive to modern medicine and hygiene.

(W. H. CH.)

**Caro Rodriguez, Jose Maria:** see RODRIGUEZ, JOSE MARIA CARO.

**Carpato-Ukraine.** This former easternmost province of Czechoslovakia which had been from 1939 to 1945 under Hungarian occupation—before 1918 it had been for very many centuries part of Hungary—was ceded on June 29, 1945, to the soviet union. Carpatho-Ukraine or Ruthenia is a territory of 4,871 sq.mi. with a population of 725,357 according to the census of 1930. Of this population 450,925 were of Ukrainian or Ruthenian nationality. According to religion, 359,167 were Greek Catholics, 112,034 Greek Orthodox, 102,542 Jewish.

The agreement between soviet Russia and Czechoslovakia regarding Carpatho-Ukraine provided for the inclusion of that territory into the Ukrainian Soviet Socialist Republic. Persons of Ukrainian and Russian nationality living in Czechoslovak territory received the right to opt for soviet citizenship until Jan. 1, 1946. The same right of option was given to Czechoslovak nationals residing in the Carpatho-Ukraine. Persons so opting were to move into the state whose nationality they acquired. They could take with them all their mobile goods free of any customs duty and were to be compensated for immobile goods.

(H. Ko.)

**Cassel, Gustav** (1866-1945), Swedish economist, was born Oct. 20 at Stockholm. After gradu-

ating from Uppsala university, he received his Ph.D. degree from Stockholm university in 1895. Professor of political economy at the latter school from 1904 to 1933, he later became professor emeritus and acted as tax and finance expert for the department of finance of the Swedish government. Considered an outstanding authority on monetary and international economic affairs, Cassel regarded planned economies with suspicion, maintaining that once the economic domain came under authoritative control, other liberties might vanish. In 1928 he was invited by the U.S. banking committee of the house of representatives to advise on the stabilization of the dollar. Some years later, he advocated a permanently managed currency and controlled currency inflation. Cassel was the author of numerous works on financial affairs and his latest books include *On Quantitative Thinking in Economics* (1935) and *The Downfall of the Gold Standard* (1936), as well as *Autobiography*, 2 vols. (1940-41). He was named to the Royal Swedish Academy of Science in 1914, received the academy's gold medal in 1922 and was president in 1926. He died Jan. 14, according to a Stockholm report. See *Encyclopædia Britannica*.

**Cassirer, Ernst** (1874-1945), German philosopher, was born at Breslau July 28. For his earlier career, see *Encyclopædia Britannica*. Dr. Cassirer, who was ousted from a professorship at the University of Hamburg in 1933 because of the Hitler racial laws, left Germany and lectured for two years at All Saints college, Oxford. In 1936 he became professor of philosophy at the University of Gothenburg, Sweden.

Dr. Cassirer was visiting professor at Yale university, New Haven, Conn., 1941-44, and was later appointed visiting professor of philosophy at Columbia university, New York city. He died in New York city, April 13.

**Catastrophes:** see DISASTERS.

**Catholic Church:** see ROMAN CATHOLIC CHURCH.

**Catholic Community Service, National:** see SOCIETIES AND ASSOCIATIONS.

**Catholic Library Association:** see SOCIETIES AND ASSOCIATIONS.

**Catholic Organizations for Youth.** The official national co-ordinating agency for Catholic organizations for youth in the United States is the youth department of the National Catholic Welfare conference with headquarters at 1312 Massachusetts Ave., Washington 5, D.C.

In 1940, the bishops of the Catholic Church in the U.S. established this department to guide and co-ordinate Catholic youth groups and organizations on a national basis.

On a regional basis, as of 1945, 106 of the 117 diocesan divisions in the U.S. had established diocesan servicing and co-ordinating agencies under the direction of a diocesan youth director.

Almost all of the 20,906 local parishes of the Catholic Church in the U.S. conducted one or more programs or organizations for youth during 1945.

The structure which unifies and co-ordinates all approved Catholic youth groups is the National Catholic Youth council. Approved by the national hierarchy and supervised by the youth department, National Catholic Welfare council, the National Catholic Youth council is composed of a diocesan section and a college and university section.

The diocesan section of the N.C.Y.C. is comprised of diocesan youth councils which in turn are made up of parish youth councils or organizations.

The college and university section of the N.C.Y.C. is formed of two national student federations: the National Federation of Catholic College Students which related in 1945 the student bodies of about 102 Catholic colleges in the U.S.; the Newman Club federation which was composed at that time of 116 Catholic student clubs in non-Catholic colleges and universities.

Within the framework of this federating machinery, a number of national Catholic youth-serving programs assist the development of diocesan and parochial units in which youth are organized. Besides the diocesan agencies assisting local youth groups in their organizational and program needs, the following national groups offered programs to local units in 1945 and were adopted in many areas throughout the country: the Queen's Work, 3742 W. Pine Blvd., St. Louis, Mo.; The Catholic Student Mission Crusade, Shattuc Ave., Cincinnati, O.; the Junior Catholic Daughters, 39 Manchester Ter., Mount Kisco, N.Y.; the Columbian Squires, 45 Wall St., New Haven, Conn.; The Catholic Central Verein, 3835 Westminster Pl., St. Louis, Mo.; The Catholic Committee on Boy Scouts, 2 Park Ave., New York city, N.Y.; The Junior Holy Name society, 141 E. 65th St., New York city, N.Y.

A directory of diocesan and national Catholic youth-serving organizations was published by the youth department of the National Catholic Welfare conference wherein are listed the headquarters, personnel, objectives and programs of these agencies under convenient headings according to the six main categories of Catholic youth work. (C. E. Bm.)

## Catholic Rural Life Conference, National.

A national organization of bishops, priests and lay persons, founded in 1923 by Bishop Edwin Vincent O'Hara and a group of priests, and dedicated to the economic, social and spiritual interests of the U.S. farmer. The newly adopted constitution pledged the conference to promote the social and economic well-being of the rural population by applying the principles of Catholic ethics to rural and agricultural problems and to strengthen and expound the Catholic faith in rural districts.

The 23rd convention and 3rd wartime meeting was held at Des Moines, Ia., Oct. 22-24, 1945, under the presidency of Bishop J. H. Schlarman of Peoria, Ill. Rural life directors representing 75 dioceses were present. The public session was attended by 1,000 persons. Discussion centred around promotion of practical schools of agriculture and establishment of veterans upon the land.

The convention went on record in favour of: (1) formation of land associations to help worthy rural youth; (2) extension of the co-operative movement; (3) better housing, electrification and beautification of farm homes; (4) legislation favouring family type farms; (5) decentralization of industry; (6) decent minimum wage for agricultural workers; (7) protection of the right of these workers to organize for obtaining just wages, proper housing and decent working conditions. The convention also approved principles and methods set forth in the statement, "Man's Relation to the Land," issued by Catholic, Protestant and Jewish religious leaders during the course of the year.

During 1945 the conference sponsored 82 rural life schools and institutes, with a total attendance of 22,000. Study groups in Catholic seminaries numbered 35, with 350 students participating.

The Most Rev. William A. Griffin, bishop of Trenton, N.J., was elected president (1946), and the Rt. Rev. L. G. Ligutti was reappointed executive secretary. *Land and Home*, a quarterly, is the official publication. Permanent headquarters in 1945 were at 3801 Grand Ave., Des Moines 12, Ia.

(J. LAF.)

## Catholic Welfare Conference, National.

The conference was organized by the bishops of the United States in Sept. 1919, to unify, co-ordinate and organize the Catholic people of the United States in works of education, social welfare, immigrant aid and other social and religious activities.

The conference is conducted by an administrative board consisting of ten archbishops and bishops. The administrative bishops report annually upon the work of the conference to the Holy See.

The annual meeting of the conference was held at Washington, D.C., Nov. 13-16, 1945, attended by 111 members of the hierarchy. Members elected or re-elected to the administrative board were: chairman, Most Rev. Samuel A. Stritch, archbishop of Chicago, Ill.; vice-chairman, Most Rev. John Gregory Murray, archbishop of St. Paul, Minn.; secretary, Most Rev. Francis J. Spellman, archbishop of New York, N.Y.; treasurer, Most Rev. John M. Gannon, bishop of Erie, Pa.; chairman of the department of Catholic action study, Most Rev. John J. Mitty, archbishop of San Francisco, Calif.; chairman of the youth department, Most Rev. Richard J. Cushing, archbishop of Boston, Mass.; chairman of the legal department, Most Rev. Joseph F. Rummel, archbishop of New Orleans, La.; chairman of the education department, Most Rev. John H. Ryan, archbishop of Omaha, Neb.; chairman of the department of lay organizations, Most Rev. John F. Noll, bishop of Fort Wayne, Ind.; chairman of the social action department, Most Rev. Karl J. Alter, bishop of Toledo, O. Mgr. Howard J. Carroll was reappointed general secretary.

In the field of international relations the bishops of the administrative board on April 14 issued a statement on world peace, in anticipation of the United Nations conference about to open at San Francisco. The statement rejected isolationism, expressed concern for the rights of small nations, recommended adoption of an international bill of rights and pointed out that true democracy is founded on the dignity of man and is therefore incompatible with the Marxian philosophy. At the annual meeting a further statement was issued urging constructive work for peace and warning against the dangers of power politics.

Mgr. John A. Ryan, pioneer in American Catholic social thought and long associated with the conference as director of its social action department,

died on Sept. 16, at the age of 76. During the 26 years of the conference's existence Mgr. Ryan had been responsible for numerous socially progressive statements issued by it. One of his last acts was to urge the establishment of a permanent fair employment practices commission on the national level. Rev. Raymond A. McGowan was named director of the social action department, to succeed Mgr. Ryan.

In April the conference made known that it favoured the Mead-Aiken bill (S. 717) as providing federal aid impartially to all schools rather than the Thomas bill (S. 181) which assists only public schools.

Victims of World War II continued to be helped by the conference during 1945 through its War Relief services. A special service was set up for the liberated Philippine Islands and Rev. William F. Masterson, S.J., was named representative. In July the New York office of the relief services met with tragedy when an army plane crashed into the Empire State building. It killed ten and injured five N.C.W.C. employees. A vast war relief food campaign was launched by the services toward the close of 1945.

For the second year the *Acta Apostolicae Sedis*, official publication of papal documentation, was published in the U.S. by the conference for circulation in 38 countries which otherwise could not receive it because of wartime conditions.

The news service of the press department was distributed to subscribing papers in 32 countries. This service marked its silver jubilee in April. Manuel Colayco, Filipino editor, killed in Manila, was the second N.C.W.C. correspondent to die in action.

Having completed 25 years of service with the conference, five members of the N.C.W.C. staff received a special greeting and blessing from Pope Pius XII. National headquarters in 1945 were at 1312 Massachusetts Ave., N.W., Washington 5, D.C. The N.C.W.C. has as its official publication the monthly *Catholic Action*. (J. LAF.)

**Catholic Youth Organization:** see CATHOLIC ORGANIZATIONS FOR YOUTH.

**Cattle.** The number of cattle, including cows kept for milk, in the United States passed a high peak in 1944 and continued to decline in 1945. The total number reported by the United States department of agriculture on Jan. 1, 1945, was 81,760,000 head compared with a total of 82,400,000 head on Jan. 1, 1944. The average for the previous ten-year period 1934-43 was 70,200,000 head. Slaughter trends in 1945 indicated that the total number on Jan. 1, 1946, would only be slightly less than at the beginning of the year.

The number of milk cows reached a high record of 27,800,000 head on Jan. 1, 1945, but declined about 2% by June and was expected to show a further decline at the end of the year due to the smaller number of heifer calves saved during 1944-45.

The slaughter of cattle and calves and the output of beef and veal continued at a high level in 1945 near to the record slaughter of 1944. Beef prices were held down in 1945 by retail price ceilings. Producer subsidies of 50 cents per 100 lb. on sales of the better grades of live cattle of over 800-lb.

QUADRUPLET Hereford calves with their dam on the farm of C. D. Lucas in Dyer, Ky., where they were born on April 18, 1945. Weighing about 50 lb. each at birth, they were reported as the only living quadruplet calves

weight were continued through the year and authorized through June 1946. Subsidy payments to slaughterers of from \$1.25 to \$3.00 per 100 lb. live-weight were also a factor in making more meat available to consumers.

The number of cattle fed for high quality beef was about as large as during the previous season. The number on feed on Jan. 1, 1945, was almost as large as in 1942 and 1943. A total of 4,173,000 head was reported on feed Jan. 1, 1945, compared with a prewar average of 3,000,000 head. The large and late corn crop was a factor in encouraging feeding since this is the best way to use soft corn resulting from early frosts.

The total value of cattle declined slightly in 1944 and 1945. On Jan. 1, 1945, the total value of cattle was \$5,505,000,000 compared with \$5,661,000,000 a year earlier. This was double the average of 1934-43 which was \$2,770,000,000.

Meat consumption continued through the year at a high level though not as high as in 1943 and 1944. From a high record of 177 lb. per capita, meat production declined to 160 lb. per capita and was expected to continue near that level. The requirements for meat for the armed forces and for export began to decline in late months of 1945 as reserve stocks were released. Much of the latter was taken by relief agencies however which served to stabilize the market. The major factor affecting returns to cattle producers in late 1945 and 1946 was the manner in which government subsidies and price control were handled. (See also LIVESTOCK.)

After the peak of war construction had been passed late in 1942 there was a sharp drop in cement production, extending to early in 1945, when the approaching end of the war brought a renewal of building activity, causing an increase in cement output from 5,371,000 bbl. in February to 11,104,000 bbl. in October. Production during the ten months was 10% above the same period of 1944, and shipments were 9% above. This was only the first lap in a postwar building program that was expected to reach unprecedented proportions under the combined demand for home, commercial, industrial, municipal and government construction.

Cement sales in Canada followed the same general trend as in the U.S. Output declined from 7,302,289 bbl. in 1943 to 7,190,851 bbl. in 1944. The production trend turned upward in Feb. 1945, and sales for the first nine months of the year were 6,384,732 bbl., 15% over the same period of 1944. (See also GYPSUM.) (G. A. Ro.)

**Censorship.** The U.S. Office of Censorship was the first federal agency to cease operations after the end of hostilities. Within 24 hours after the surrender of Japan the president approved a recommendation of Director Byron Price that all censoring activities stop on Aug. 15, 1945. Having fulfilled its two wartime responsibilities—the censorship of international communications and the supervision of the voluntary self-censorship of the U.S. press and radio—the office completed its liquidation and went out of existence on Nov. 15.

The defeat of Germany in May 1945 had enabled the Office of Censorship to invoke a long-considered plan of lifting many censorship restrictions that were unnecessary to the one-front war against Japan. Shortly after V-E day the office issued a curtailed code of wartime practices for the U.S. press and radio, listing items of information which were dangerous to national security and which U.S. editors and broadcasters were requested not to disseminate. Censorship regulations affecting letters, cables, radiograms and telephone calls leaving or entering the U.S. also were relaxed to permit a freer flow of business and personal communications, particularly across the Atlantic ocean and adjacent waters, which the navy designated as a noncombat zone.

Correspondence flowing through the cable, postal and telephone censorship stations on U.S. borders increased as more liberated areas abroad were opened to communication. But the realignment of Office of Censorship operations permitted substantial economies. Early in the year the cable and postal stations in Seattle, Wash., were closed, because the work there could be done at other points. In April, 1945, the military authorities in Hawaii took over the operation of the two Honolulu stations at the suggestion of Director Price. Various readjustments in communications censorship between the defeats of Germany and Japan resulted in a personnel reduction of one-third. A similar cut was made in the staff of a dozen experienced newspaper and radio men who administered the voluntary censorship program. The agency's budget for the fiscal year starting July 1, 1945, was \$13,000,000 in contrast to the \$29,700,000 for the preceding year. Actually, because of the end of the war, only \$4,800,000 of the appropriation was utilized.

The successful program of voluntary censorship of the domestic press and radio, unique in history, was climaxed in August by disclosure of the development of the atomic bomb. Editors and broadcasters had helped preserve the secrecy around this project by refraining from divulging any information on atomic experiments. Dropping of the first bomb on Japan was a complete surprise to the enemy and therefore attested to the efficiency of voluntary censorship. Major General L. R. Groves, in charge of the bomb's development, paid tribute to the press and radio for their patriotic co-operation.

This, however, was only one of many subjects of military information which censorship—both of the press and radio and of international communications—kept from the enemy. In addition, intercepted information of use in prosecuting the war was turned over to the proper government agencies. (See also NEWSPAPERS AND MAGAZINES; RADIO.) (B. PR.)

**Census Data, 1945.** By way of supplement to the results of the periodic censuses, the bureau of the census collects a wide variety of data on a monthly, quarterly, or annual basis, publishes frequent estimates of population, labour force, employment and unemployment, and makes special censuses of limited areas and surveys in various fields from time to time, as occasion demands. A considerable part of the current data is based on sample inquiries and is, therefore, subject to a moderate sampling variation. With respect to these sample-based statistics it may be said that in

general the totals and the larger subtotals in any given table are subject to a fairly small error from this source, but that the smaller and more detailed subtotals are subject to a possibility of error which increases with the decrease in the size of the figures in question.

**Growth of Total Population.**—Estimates of the population of the United States as a whole have been made month by month since the census of 1940, on a basis of current records of births and deaths (corrected for under-registration) and net immigration, the latter including the excess of arrivals over departures of citizens as well as aliens. The estimates for Jan. 1 and July 1 of each year from this series are presented in Table I. These estimates represent the *de jure* population, including persons in military service overseas. The table also shows the increase in each six-month period and indicates what part of this increase is the result of the excess of births over deaths and what part represents immigration from foreign countries. (The estimates are presented to the last digit as computed instead of being rounded, not because they are assumed to be accurate to the last digit but for convenience in summation.)

Table I.—Estimated Population of Continental United States Including Armed Forces Overseas, for Specified Dates: July 1, 1940, to July 1, 1945

Date	Estimated population, including armed forces overseas	Increase since preceding date		Source of increase	
		Number	Per cent	Excess of births over deaths	Net civilian immigration
July 1, 1945 . . .	139,621,431	698,797	0.50	592,089	106,708
Jan. 1, 1945 . . .	138,922,634	839,185	0.61	746,980	92,205
July 1, 1944 . . .	138,083,449	715,070	0.52	641,728	73,342
Jan. 1, 1944 . . .	137,368,379	871,330	0.64	818,457	52,873
July 1, 1943 . . .	136,497,049	851,080	0.63	792,196	58,884
Jan. 1, 1943 . . .	135,645,969	981,045	0.73	929,913	51,132
July 1, 1942 . . .	134,664,924	711,699	0.53	674,244	37,455
Jan. 1, 1942 . . .	133,953,225	750,352	0.56	718,562	31,790
July 1, 1941 . . .	133,202,873	564,940	0.43	555,568	9,372
Jan. 1, 1941 . . .	132,637,933	667,709	0.51	618,457	49,252
July 1, 1940 . . .	131,970,224	...	...	...	...

The population of continental United States on July 1, 1945, according to these estimates, was 139,621,431, which represents an increase of 1,537,982 over the population estimated for July 1, 1944. The sources of this increase may be analyzed as follows: There were, during the year ending June 30, 1945, 2,970,284 births, from which may be subtracted 1,631,215 deaths, leaving a natural increase of 1,339,069, which represents the major part of the population increase. The remainder was made up of net civilian immigration amounting to 198,913. The rate of increase for the year ending in June 1945 was 1.1%, which is slightly less than the rate of increase attained in some of the years just preceding, but much higher than the average annual rate of 0.7% for the decade 1930 to 1940. The maximum increase in any six-month period, it may be noted, was that in the second half of the year 1942, which amounted to 981,045, or 0.73%.

The recent acceleration in the rate of population growth results mainly from a very considerable increase in the annual number of births. During the calendar year 1943, in which the birth rate reached its maximum, there were 3,158,593 births, as compared with 2,558,000 in 1940 and an annual average of about 2,400,000 for the decade between 1930 and 1940. In the calendar year 1944 the number of births had fallen to 2,969,186, though it was still higher by more than 500,000 than the prewar average. The rapid increase in the birth rate after 1940 followed an almost continuous decline from 1921 to 1936 and a very slight increase between that date and 1940. It may be attributed, first, to the business prosperity induced by defense activities, and then to the anticipation of conscription and of the actual entry of the United States into the war. The marriage rate increased from 10.5 per 1,000 of the population in 1939 to 13.1 in 1942; and while the number of marriages in 1943 and 1944 was substantially lower than in the peak year, it was still

above the number reported for 1940. The increase in the number of marriages was followed by an increase in the number of first births and there was also an increase in the number of children born to couples married earlier. The number of deaths in 1944, however, was only a little larger, even with war casualties included, than the number in 1943 and only about 150,000 above the average for the preceding ten years.

The trend in the number of births seemed to have passed a definite peak in 1944, with a reduction of about 6% from the record of 1943, but a comparison of the figures available month by month for 1945 indicates very little further reduction. In fact, the preliminary total for the ten months from January to November in 1945 is less than 2% smaller than the total for the same months in 1944. It seemed likely, then, that the rate of population growth might continue during the next two or three years at about the rate prevailing in 1944 and 1945, unless there should be another considerable increase in the birth rate as a result of the release of several millions of men from military service overseas. (Preliminary returns for marriages were showing a marked increase month by month after July 1945.)

While those population estimates which include the military forces abroad are perhaps the most fundamental of all the estimates which it has been found possible to make, there are many purposes for which it is desired to have an estimate representing only the population actually in continental United States. Such estimates are presented in Table II.

Table II.—Estimated Population of Continental United States Excluding Armed Forces Overseas and Estimated Civilian Population, for Specified Dates: July 1, 1940 to July 1, 1945

Date	Estimated population excluding armed forces overseas		Estimated civilian population	
	Increase (+) or decrease (—) since preceding date		Increase (+) or decrease (—) since preceding date	
	Population	Number Per cent	Population	Number Per cent
July 1, 1945	131,975,774	+311,802 +0.24	127,409,297	+372,008 +0.29
Jan. 1, 1945	131,663,972	-888,033 -0.67	127,037,289	+501,115 +0.40
July 1, 1944	132,552,005	-1,028,278 -0.77	126,536,174	-491,862 -0.39
Jan. 1, 1944	133,580,283	-386,036 -0.29	127,028,036	-382,321 -0.30
July 1, 1943	133,966,319	-75,345 -0.06	127,410,357	-1,317,486 -1.02
Jan. 1, 1943	134,041,664	+271,164 +0.20	128,727,843	-2,147,067 -1.64
July 1, 1942	133,770,500	+82,057 +0.06	130,874,910	-1,068,155 -0.81
Jan. 1, 1942	133,688,443	+628,398 +0.47	131,943,065	+385,335 +0.29
July 1, 1941	133,060,045	+499,202 +0.38	131,557,730	-339,229 -0.26
Jan. 1, 1941	132,560,843	+606,699 +0.46	131,896,959	+237,673 +0.18
July 1, 1940	131,954,144	...	...	...

The estimate on this basis for July 1, 1945, is 131,975,774, which represents a decrease of 576,231, as compared with the corresponding estimate for July 1, 1944, and a still greater decrease as compared with the figure for a year earlier. These decreases represent the amount by which the departure of men during the year for overseas service exceeded the natural increase in the population plus net immigration. Estimates of population on yet another basis, namely, the civilian population, excluding not only the military forces overseas but also military personnel resident in camps and on other military reservations in the United States, are also presented in Table II, with a total in July 1945 of about 127,000,000 or about 4,000,000 less than the total population in 1940.

To make clear the significance of the item which has been referred to above as natural increase or the excess of births over deaths, there is presented in Table III a summary of the data on births and deaths (adjusted for under-registration) for the fiscal years 1941 to 1945. In this grouping of the data, as in the presentation by calendar year, the year 1943 stands out as having the maximum number of births; and the appreciable increases in the number of deaths in 1944 and 1945 (resulting largely from war casualties) stand out in comparison with the relative uniformity of these figures in the earlier years.

**Internal Migration 1941-45.**—The latest figures available at the close of 1945 on the movement of population from one

Table III.—Births and Deaths in Relation to Population Increase:  
Fiscal Years 1941 to 1945

Year ending	Population increase		Births	Deaths	Excess of births over deaths	Net civilian immigration
	Number	%				
June 30, 1945 . . .	1,537,982	1.1	2,970,284	1,631,215	1,339,069	198,913
June 30, 1944 . . .	1,586,400	1.2	3,016,562	1,556,377	1,460,185	126,215
June 30, 1943 . . .	1,832,125	1.4	3,209,177	1,487,068	1,722,109	110,016
June 30, 1942 . . .	1,462,051	1.1	2,808,000	1,415,194	1,392,806	69,245
June 30, 1941 . . .	1,232,649	0.9	2,628,113	1,454,088	1,174,025	58,624

place to another within the U.S. are the results of a survey of the movement of the civilian population (omitting persons in institutions) between Dec. 1941 and March 1945. In this survey an inquiry was made of a representative sample of about 30,000 families in March of 1945, in which each person was asked where he was living on Dec. 7, 1941. This survey indicates that 15,330,000 persons were living in 1945 in a county different from that in which they lived in 1941. Of this number, 7,670,000 had moved from one state to another, and 3,580,000 had moved from one to another of the three regions designated the north, the south and the west. The figures representing interstate movement are shown by regions in Table IV. The interstate migration in this 3½-year period somewhat exceeded the migration recorded in the 1940 census for the 5-year period 1935 to 1940, in which, out of a total of 15,734,798 intercounty migrants, 6,495,049 had crossed state lines and 2,647,651 had moved from one major region to another. A better measure of the relative extent of internal migration, as between these two periods, is the average per year. The average number of interstate migrants per year in the more recent period was 2,360,000, as compared with 1,300,000 in the earlier (and longer) period. Even this difference, however, represents perhaps not quite so much increase in mobility as one would have expected to find as a result of war conditions, with the extensive migration of workers to centres of war production.

Table IV.—Interstate Migration of Civilian Population, by Regions,  
December, 1941, to March, 1945

Residence in 1945	Total migrants between states	Between states in same region	Total	Migrants between regions		
				Residence in 1941		
				The North	The South	The West
Total . . .	7,670,000	4,090,000	3,580,000	1,550,000	1,630,000	400,000
The North . . .	2,950,000	1,710,000	1,240,000	...	980,000	260,000
The South . . .	2,390,000	1,610,000	780,000	640,000	...	140,000
The West . . .	2,330,000	770,000	1,560,000	910,000	650,000	...

Another feature of the survey just referred to was a question on farm residence at the beginning and the end of the period covered. The answers to this question indicated that 5,440,000 people moved from farms to nonfarm areas, while 2,510,000 were found living on farms in 1945 who had been living in nonfarm areas in 1941. In this exchange the farm population sustained a net loss of 2,930,000. During the same period, the farm areas also lost about 1,500,000 through enlistments and inductions into the armed forces.

Because of the demand for workers in war production centres, the rate of migration from farms was much greater during this period than in normal times, though there had been for many years a continued and fairly extensive migration from farms to urban areas. The net loss through the movement of civilians from farms averaged around 900,000 a year in the period from 1941 to 1945, which may be compared with an average of 375,000 per year during the depression decade of the 1930s and 630,000 per year during the 1920s.

This wartime migration to and from farms was largely a short-distance movement between a city or town and its surrounding rural areas, as shown in Table V. Of the 4,160,000 persons 14 years old and over who left the farm population, 2,480,000 moved from farm to nonfarm areas within the same county; 920,000 moved to a different county within the state;

TRENDS in the labour force, 1941-50 (Source: U.S. Bureau of the Census)

and only 760,000 moved from a farm in one state to a nonfarm area in another state. The reverse movement from nonfarm areas to farms was distributed in somewhat similar fashion.

Table V.—Civilian Migration Between Farms and Nonfarm Areas:  
December, 1941 to March, 1945

Item	From farm to nonfarm	From nonfarm to farm	Net loss to farm areas
Total farm-nonfarm migrants (all ages) . . . . .	5,440,000	2,510,000	2,930,000
Farm-nonfarm migrants 14 years old and over . . . . .	4,160,000	1,890,000	2,270,000
Farm-nonfarm migration involving movement—			
Between states . . . . .	760,000	350,000	410,000
Between counties in same state . . . . .	920,000	510,000	410,000
Within same county . . . . .	2,480,000	1,030,000	1,450,000

Apparently the cities had drawn to a considerable extent upon workers from nearby farming areas, both to expand production in their own war industries and to replace the workers who had entered the armed forces or migrated to other cities to take more attractive war jobs. A considerable amount of migration thus results from urban workers' moving to a different city and being replaced by migrants from surrounding rural areas. A relatively large proportion of the long-distance migrants were city workers, that is, workers who lived in nonfarm areas both in 1945 and 1941.

**Employment and Labour Force.**—On the basis of data obtained each month from a representative sample of about 30,000 households, monthly estimates were published from March 1940 giving the number of persons in the civilian labour force, the number employed (with separate figures for those in agriculture and those in nonagricultural occupations), and the number unemployed. These figures are summarized for the month of July 1940 to 1945, in Table VI. The month of July, it may be

Table VI.—Civilian Employment and Unemployment in the United States: 1940 to 1945

noted, represents the peak in the seasonal variation in the number of persons in the labour force, being a month of active employment in agriculture and also a month in which many young persons are working during school vacation.

The effect of the induction of men into military service and the fact of their partial replacement by women are clearly indicated by the figures shown for the civilian labour force. The number of males in the civilian labour force in July 1940 was 42,570,000, which number had declined by July 1945 to 34,940,000. The number of females in the labour force, on the other hand, increased from 13,850,000 in July 1940 to a maximum of 19,110,000 in July 1944, with a slight decrease to 18,810,000 by July 1945.

The gradual disappearance of unemployment is likewise indicated by these representative monthly figures. In July 1940, 14.9% of the labour force was unemployed (including those on public emergency work); by July 1941, this percentage had been reduced to 9.3; by July 1942, to 4.3; by July 1943, to 2.3; and by July 1944, to 1.8, which last figure may be assumed to represent approximately the minimum number of persons who will, in July of any year, be in process of passing from one job to another—the so-called “frictional unemployment.”

The number of persons employed in agriculture declined from 10,660,000 in July 1940 to 9,140,000 in July 1945. This net loss of 1,520,000 resulted from a decline of 2,380,000 in the number of males employed in agriculture, partly offset by an increase of 860,000 in the number of females so employed. The number of persons employed in nonagricultural occupations increased from 37,350,000 in July 1940 to a maximum of 45,050,000 in 1943, and stood at 43,520,000 in July 1945. The number of females employed in nonagricultural occupations was 10,080,000 in July 1940 and 16,170,000 in 1945, the increase in this number thus accounting for practically all of the in-

crease in the whole number of nonagricultural workers.

Recent changes in employment and the labour force are indicated by the figures in Table VII, the first column of which gives an over-all measure of the entire labour force, including persons in the armed forces as well as civilian workers. (The July data in this table differ slightly from the figures shown for July 1945, in Table VI, because of a minor change in the methods followed in the monthly survey, adjustments for which had not yet been carried back into the earlier records.) Some of the changes shown in the month-to-month data are the usual seasonal changes, like the decline in agricultural employment between

July and Nov. or Dec. 1945; others, like the increase in unemployment, measure changes resulting from the closing down of war industries and the re-employment of personnel in civilian activities. The increase in unemployment, up to Dec. 1945, it may be noted, was far less than had been expected. The decrease of more than 5,000,000 in the total labour force, including the armed forces (or the excess over the usual seasonal decline of around 2,000,000), represents in part the fact that many recently discharged veterans were not yet either at work or actively seeking work, and in part the probably permanent retirement from the labour force of women who had taken jobs under stress of wartime demands.

**Normal Labour Force Estimates.**—As a basis for forecasts of employment needs and as a standard for measuring temporary wartime increases in employment, estimates of the “normal” labour force were computed for the years 1941 to 1950. These estimates represent the labour force that would have been expected if the trends of preceding years had continued after 1940 under economic conditions similar to those of 1940.

During the war years, the actual number of persons in the labour force (including the armed forces) was much greater than what would have been expected on a basis of long-term trends, the excess amounting in 1944 to approximately 6,500,000.

Table VII.—Total Labour Force by Employment Status: July to Dec. 1945

Week ending		Civilian labour force (14 years old and over)					Unemployed	
		Total labour force including armed forces	Total civilian labour force	Employed		In non-agricultural industries		In agriculture

Aug. 1945.		46,910,000	35,020,000	34,590,000	27,700,000	6,890,000	430,000	
July 1945.		47,150,000	35,140,000	34,660,000	27,530,000	7,130,000	480,000	
Female								
Dec. 1945.		17,360,000	17,180,000	16,710,000	15,510,000	1,200,000	470,000	
Nov. 1945.		18,370,000	18,160,000	17,630,000	15,560,000	2,070,000	530,000	
Oct. 1945.		18,760,000	18,520,000	17,900,000	15,710,000	2,190,000	620,000	
Sept. 1945.		18,920,000	18,650,000	17,930,000	15,790,000	2,140,000	720,000	
Aug. 1945.		19,600,000	19,330,000	18,930,000	16,770,000	2,160,000	400,000	
July 1945.		20,350,000	20,080,000	19,610,000	16,900,000	2,710,000	470,000	

It seemed likely that some part of this excess would persist for several years after the war, especially if relatively full employment was maintained. On the other hand, war casualties would subtract somewhat from the number of men who would have been in the labour force, had there been no war.

Table VIII, which presents the 1950 estimates by age and sex against a background of earlier census figures, provides material for some analysis of the significance of the estimates. As between one age group and another, there are wide differences in the percentage of the population in the labour force, but within a given age group there is usually evidence of a consistent trend. In the age group 14 to 19 years, for example, both male and female, there is a consistent decline in labour force participation (which means either working or seeking work), resulting presumably from longer time spent in school. Likewise, with both males and females 65 years old and over, there is a decrease, resulting mainly from earlier retirement. On the other hand, the figures indicate a continuous increase in the percentage of women between 20 and 64 years of age in the labour force. The 1950 estimates, it may be noted, represent the result of trends already established prior to 1940 and do not include those women who came into the labour force under stress of wartime conditions, many of whom might still be in the labour force at the end of the decade.

In Table IX actual labour force data for the years 1941 to 1945 are presented for comparison with the estimated normal labour force. In this table the figures represent averages for the year rather than estimates for a single period. The "normal" estimates are thus somewhat larger than the corresponding figures in Table VIII, partly because of seasonal variations, the labour force in April being less by about 2,000,000 than the maximum in midsummer, and partly because of natural growth from month to month, which adds about 700,000 to the labour force in the course of a year.

Table IX.—"Normal" Labour Force, 1941 to 1950, and Actual Labour Force, 1941 to 1945

1950	...	...	...	60,470	43,670	16,800	...	...	...

\*Preliminary figures.

The normal labour force estimated for 1950, it may be noted, exceeds by nearly 500,000 the figure of 60,000,000 jobs which had been so much discussed in late 1945; and the actual labour force of 1950 is likely to be appreciably larger than this figure, since the holdover of wartime excess employment is likely to exceed the relatively small number of war casualties. (About 300,000 deaths of persons in military service had been reported up to the end of 1945.)

Table VIII.—Population and Labour Force, April 1930 and 1940, and Estimated Population and "Normal" Labour Force, April 1950, by Sex and Age, for the United States

\*Estimated "normal" labour force; actual labour force likely to be somewhat higher.

The relation between the actual labour force and the normal labour force is indicated for the major part of the war period in the chart on p. 187, in which the shaded area represents the amount by which the wartime labour force exceeded the estimated normal. The diagram is plotted on the basis of quarterly data which are not yet available, at this writing, for the third and fourth quarters of 1945. As indicated by the averages presented in Table IX, the steep downward trend shown for the actual labour force during the second quarter of 1945 was not maintained in the latter half of the year, though the trend presumably still continued downward.

**Marriages.**—The number of marriages in the United States increased rapidly, under stress of approaching war conditions, from 1939 to 1942, then declined slightly in 1943 and still further, to about the 1940 level, in 1944. The decline apparently came to an end during the first half of 1945, and a new increase began, based first on the promise of recovery from wartime restrictions and then reflecting the actual return of large numbers of veterans from the war areas. The annual data for the United States as a whole are summarized in Table X, while the month-to-month changes from 1941 to the end of 1945 in the number of marriage licences granted in the 92 cities of 100,000 or more (containing about one-third of the nation's population) are presented in Table XI.

The very considerable increases in the numbers of marriage licences issued in the large cities in the months from July to Dec. 1945, without doubt represent marriages of veterans returning from overseas. If increases of this magnitude were to continue through the early months of 1946, a total for the fiscal year ending June 30, 1946, might rival the record year 1942. The number of licences issued in Dec. 1945, exceeded the number issued in Dec. 1944, by 32.5%. The large-city total for the entire year 1945 was 10.8% higher than that for 1944 and larger than any earlier year's record except the peak year, 1942.

Table X.—Marriages in the United States: 1939 to 1945

Year	Number of marriages	Increase (+) or decrease (−) in preceding year	
		Number	Per cent
1945*	1,600,000	155,000	+9.4
1944	1,445,000	-132,000	-8.4
1943	1,577,000	-181,000	-10.3
1942	1,758,000	79,000	+4.7

**Families.**—The number of families in the United States continued to increase during the war, in spite of the fact that the civilian population was actually growing smaller from year to year as a result of inductions into the armed forces. According to estimates based on a sample survey made in May 1944, there were at that time approximately 37,000,000 families, or about 2,000,000 more than in April 1940. Preliminary returns from a survey made in Nov. 1945 indicate an increase in the number of families to about 37,600,000. These figures, it may be noted, represent an annual increase of about 500,000 families after 1940.

The increase in the number of families was the result of continued additions to the population and the abnormally high marriage rate which had prevailed from 1940, offset in part by the merging of families as a result of inductions into the armed forces. Many of the war marriages did not result in the formation of new families, either because the bridegroom was about to be inducted or because he was already in the service at the time of marriage. If, therefore, the increase in the marriage rate had occurred unaccompanied by these other wartime conditions, the increase in the number of families would have been even more rapid.

The extent to which temporary separations resulting from inductions into military service and other wartime conditions, such as the migration of individual workers to war production centres, may have checked the increase in the number of families can be judged by the fact that in May 1944 there were 2,770,000 families having as head a married woman whose husband was absent from the household. This number exceeds by about 2,000,000 the number of similar families in 1940; and it is safe to assume that the major part of this increase, at least, was made up of families having as head the wife of a man absent in military service. This assumption is supported by statistics obtained in a survey covering all married women (including those who were not heads of families) in Feb. 1944, in which it was shown that out of 4,220,000 married women with husbands absent, 2,760,000 were women whose husbands were in the armed forces.

The classification of families by sex and marital status of head is shown for 1944 and 1940 in Table XII. It may be noted that the increase in the number of families between 1940 and 1944 was entirely in families having female head, these forming 20.3% of the total in 1944, as compared with 15.3% in 1940. From other tabulations of the survey it may be noted that there were considerable increases in the number of families with married male heads 45 years old and over, a slight increase in the number with such heads 35 to 44 years old, but very radical decreases in the number with married male heads under 35 years of age.

**Census Releases Available.**—Current figures on any of the subjects for which the latest data are summarized above may be obtained on request from the bureau of the census, Washington 25, D.C. There are monthly reports on the labour force and on marriage licences issued in the large cities, and releases on other subjects from time to time through the year.

Table XII.—Families in the United States by Sex and Marital Status of Head, May, 1944 and April, 1940

Marital status of family head	1944		1940		Per cent	
	1944	1940	1944	1940	1944	1940
All families . . . . .	37,040,000	35,124,380	100.0	100.0		
Families having male head . . . . .	29,510,000	29,762,800	79.7	84.7		
Married, wife present . . . . .	26,350,000	26,632,400	71.1	75.8		
Married, wife absent . . . . .	520,000	447,280	1.4	1.3		
Single . . . . .	1,220,000	1,323,400	3.3	3.8		
Widowed and divorced . . . . .	1,420,000	1,359,720	3.8	3.9		
Families having female head . . . . .	7,530,000	5,361,580	20.3	15.3		
Married (husband absent) . . . . .	2,770,000	795,160	7.5	2.3		
Single . . . . .	1,070,000	903,460	2.9	2.6		
Widowed and divorced . . . . .	3,690,000	3,662,960	10.0	10.4

**Centennials:** see CALENDAR, 1946, page xxii.

**Central America.** That section of the Americas situated between Mexico on the north and Colombia on the south. Six republics are located in the area: Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica and Panamá; in addition it includes the colony of British Honduras and the Panama Canal Zone. Area: approximately 222,675 sq.mi.; pop.: about 8,500,000. Most of the inhabitants live in the highlands of the western cordillera.

**History.**—The political history of Central America in 1945 was somewhat less disturbed than during the previous year. No government was overthrown by rebellion; the most serious of several minor revolts and plots occurred in El Salvador in June. In Guatemala constitutional guarantees were suspended for 30 days in April and again for two months starting early in October, due in both cases to the asserted discovery of plots against the administration in power. Opposition leaders were arrested and many of them deported. One minor rebellion was reported from Honduras in April, and a few terroristic bombings took place in Panamá in the latter part of the year.

Three new administrations assumed office peacefully during 1945. In Guatemala President Juan José Arevalo took office on March 15 immediately following promulgation of a new constitution; he had been elected in December. Salvador Castañeda Castro was installed as chief executive of El Salvador after a January election from which other candidates withdrew. In Panamá a provisional government headed by former ambassador to the United States Enrique A. Jimenez was es-

STEAMING through the Panama canal, the escort carrier U.S.S. "Sangamon" nears journey's end at Norfolk, Va. Its elevator was blown up in the Ryukyus on May 4, 1945, when a Japanese suicide plane exploded on the flight deck

established after the resignation of President Adolfo de la Guardia on June 15. In this republic a national assembly started preparation of a new constitution at this time, while another change in constitutions occurred in December when El Salvador reverted to its 1886 constitution. A ban on political activity in connection with the presidential election scheduled for 1946 was lifted in Nicaragua in July by President Anastasio Somoza.

Foreign relations during the year were marked by a renewal of claims by Guatemala to British Honduras; they had been in abeyance for the war period. Guatemala and Costa Rica opened relations with the soviet union, and El Salvador indicated its intention of doing so. Panamá and Guatemala broke with the Franco regime of Spain. All republics either ratified the United Nations charter formed at the San Francisco conference or took steps toward this end. The republics participated in this conference and the earlier hemisphere parley in Mexico City, although in regard to the latter there was for a time dispute as to whether El Salvador should be admitted. During the summer the presidents of El Salvador and Guatemala met with a view toward working out a plan for union and later an agreement eliminating certain economic and political barriers was reportedly signed. Ostensibly designed as a step toward a Central American union, the plan found little favour in other republics.

Figures released by the United States government in October revealed that lend-lease military goods valued at \$23,020,000 had been sent to the five northern republics, with Guatemala receiving by far the larger part (\$21,089,000).

**Trade and Communication.**—With the ending of World War II many controls imposed at the start of hostilities were lifted in the several republics. Imported articles remained in short supply and the cost of living remained high. An increase in shipping facilities caused by the ending of the European phase of the struggle allowed restoration of the banana industry to almost normal levels. The elimination of coffee quotas during the year had little effect on the Central American nations since most had been able to ship their entire crops under the existing allowances. Hope of eventual completion of the Central American portion of the Inter-American Highway was stimulated by a recommendation by President Truman of the United States that Congress appropriate \$25,000,000 for this purpose. (See articles on individual countries.)

**Cereals:** see BARLEY; CORN; OATS; RICE; RYE; WHEAT.

**Ceylon.** A British crown colony, lying off the southern extremity of India and approaching within 6° of the equator. Area 25,332 sq.mi.; pop. (est. Dec. 31, 1943) 6,197,000. Chief towns (pop. census 1931): Colombo (cap. 284,155); Jaffna (45,708); Galle (34,424); Kandy (37,147). Governor (1945): Sir H. Monck-Mason Moore; languages: English, Sinhalese, Tamil; religions: Buddhism and Hinduism the chief.

**History.**—The report of the Soulbury commission on constitutional reform was published in the autumn of 1945. It recommended self-government on the British model, as a step to full dominion status. Ceylon was to have a bicameral legislature with cabinet responsibility; but certain subjects, such as defense, currency, external affairs and the protection of the rights of minorities, would be reserved to the governor general.

On Nov. 1 the secretary of state for the colonies announced in parliament that the constitution proposed by the Soulbury commission would be offered to the people of Ceylon. The

GROUND FORCE member of the British WAAF posted at a Ceylon flying boat base. She radio-telephoned landing instructions to incoming pilots

Ceylon state council accepted by 51 votes to 3 the British government's proposals.

War conditions gave an additional stimulus to local industries. Factories were established for the manufacture of various products, and loans to a maximum value of 10,000 rupees were granted to approved applicants. The state council debated the report of the committee which had been investigating the defects of the educational system. Its leading recommendation was to the effect that all education, from the kindergarten to the university, should be free. (H. G. RN.)

**Education.**—In 1942: Sinhalese and Tamil schools 4,114; scholars, 276,290 boys, 227,003 girls; English and bilingual schools 408; scholars, 53,882 boys, 19,846 girls. Total number of schools 5,799; scholars 785,936.

**Banking and Finance.**—Revenue (est. 1944-45) \$75,601,200; expenditure (est. 1944-45) \$74,396,400; public debt (Sept. 30, 1942) \$58,122,500; currency Rs.1=100 cents=1s. 6d. in 1944=30.12 U.S. cents.

**Trade and Communication.**—Overseas trade, merchandise, 1943: imports \$127,200,000; exports (domestic) \$161,700,000. Communication and transport: roads, motorable (1943) 6,551 mi.; railways (1943) (106 mi. narrow gauge) total 912 mi.; shipping, entered (1942) 2,724,000 net tons; motor vehicles licensed (Dec. 31, 1941), 20,092 motor cars and taxis; 4,394 trucks and vans; 2,486 omnibuses; 2,644 cycles; 66 tractors; 231 trailers; wireless receiving set licences (Dec. 31, 1940), 9,736; telephone instruments in use (1938), 10,424.

**Agriculture.**—Production, in short tons: rice (1938-39) 330,000; copra (including coco-nut oil) (1941) 169,401; tea (1943) exports 131,450; rubber (1943) shipments 137,500.

**Chain Stores:** see BUSINESS REVIEW.

**Chambers of Commerce.** In a year sharply divided into distinct periods of war and of peace, the activities of the Chamber of Commerce of the United States displayed a natural variation during 1945.

Until victory was assured, first priority was given to winning the war. Services developed during preceding war years were continued and augmented, as necessary, in order to keep businessmen informed of the ever-changing and complex effects of wartime regulations and to present to government officials the views and opinions of U.S. business.

With the surrender of Japan in August, this objective was supplanted by the urgent problem of reorienting the country's

vast industrial machine from production for war to the production of peacetime goods. This was a many-sided problem, involving major shifts in the plant operations, the flow of materials, the employment pattern and many other factors. Complicating the picture was the fact that some wartime controls were revoked almost immediately, while others were retained for varying lengths of time. The same lack of uniformity affected the supply of raw materials.

Recognizing the difficulties inherent in making many radical alterations in the business and industrial structure in a short time, the national chamber threw all its resources into the task of facilitating reconversion. During the period immediately after the cessation of hostilities, while governmental controls were being rescinded in wholesale lots, it issued daily bulletins to its membership. Nor did it content itself with acting as a transmitter of information; frequent consultations with government officials helped the organization to determine policies and to adjust federal actions to the needs of business.

While first priority was given to these primary objectives, the normal work of the chamber was not neglected. The views of its membership on legislative and economic questions affecting business life were determined and presented to appropriate federal agencies; the formation of local committees to study governmental affairs was encouraged; and the merits of free enterprise as a motivating force for progress were vigorously championed.

In May 1945, Eric A. Johnston of Spokane, Wash., was re-elected to a fourth term as president of the national chamber. Ralph Bradford was the general manager. (X.)

**Junior Chambers of Commerce.**—The objectives of the United States Junior Chamber of Commerce are: (1) improvement of the individual community through active participation in civic projects; (2) building and training of leaders, accomplished through individual participation of young men who adopt a worth-while civic project, plan its execution, arrange its financing, physically participate in its accomplishment and report in a businesslike manner the results of the program. Young men are enabled to receive education in a complete business cycle, giving them civic poise, friendships, contacts and experience in accomplishment; (3) the awakening and development of "active" citizenship through participation in community and governmental affairs.

Members, "Jaycees," as they are called, are men of good repute, ages 21 through 35. Each organization is autonomous but is provided state affiliation to exchange ideas. The U.S. Junior Chamber of Commerce consists of affiliates in every state and territory. Its purpose is co-ordination of projects, presentation of assistance in expanding the local program and recognition, nationally, of accomplishment. Special emphasis in 1945 was placed upon service to returning veterans; interest in affairs of government; and preparation of projects in Agriculture, Aviation, Americanism, Fire Prevention, Public Safety, Public Health, Sports and Recreation, Youth Activities, Community Face-Lifting and International Relations.

The U.S. Junior Chamber of Commerce regularly publishes *Future*, a magazine devoted to young men. It is financed principally from dues at the rate of \$1.00 per year. Supplementary finances were secured from sponsorship of nationwide projects.

The headquarters address in 1945 was the LaSalle hotel, Chicago, Ill. Its principal officers were: Henry Kearns, president; Rex McMorris, executive vice-president; Ken Kennedy, treasurer. (H. Ks.)

**Chandler, Albert Benjamin** (1898— ), U.S. politician and baseball commissioner, was born July 14 in Corydon, Ky., and served in

the U.S. army in 1918. He was graduated with an A.B. degree from Transylvania college, Lexington, Ky. (1921), studied at Harvard university (1921–22), and received his LL.B. from the University of Kentucky (1924). Chandler began practising law at Versailles, Ky., in 1924, was elected to the state house of representatives, 1929, was lieutenant governor of Kentucky, 1931–35 and was governor, 1935–39. He resigned the governorship in Oct. 1939 to fill a vacancy in the U.S. senate and was elected for a full six-year term in Nov. 1942. During his youth and college years, Chandler starred in football, basketball and baseball. He played semi-professional baseball with several small teams and also acted as coach for high school basketball teams in Kentucky. On April 24, 1945, the owners of the 16 major league baseball clubs, by unanimous vote, selected Chandler to fill the position of baseball commissioner vacated by the death of Kenesaw Mountain Landis. Chandler accepted the post, which carried a seven-year contract at an annual wage of \$50,000, and announced his resignation from the senate Oct. 9.

**Channel Islands:** see BRITISH EMPIRE.

**Chapultepec Conference:** see INTER-AMERICAN CONFERENCE ON PROBLEMS OF WAR AND PEACE; PAN-AMERICAN UNION.

**Charles** (CHARLES THÉODORE HENRI ANTOINE MEINRAD, COUNT OF FLANDERS) (1903— ), prince of Belgium, was born in Brussels, Oct. 10, 1903, brother of King Leopold III of the Belgians. On Sept. 20, 1944, shortly after the liberation of Belgium from German occupation, Prince Charles was appointed regent by a joint vote of the parliamentary chambers, as the king was still a prisoner of the enemy. On May 8, 1945, King Leopold was freed by Allied troops at Salzburg (see article BELGIUM for the subsequent political crisis). On May 11, Prince Charles went to Salzburg and returned with a written request that he retain the regency until the king, then in poor health, should be fit to travel. In August the regent paid a visit to London which, in spite of official denials, was popularly believed to be connected with the crisis mentioned above. (W. FOR.)

**Charter of the United Nations:** see UNITED NATIONS CONFERENCE ON INTERNATIONAL ORGANIZATION.

**Chauvel, Sir Henry George** (1865–1945), Australian army officer, was born April 16, in New South Wales. He attended the Sydney and Toowoomba grammar schools and at 21 years of age joined the New South Wales cavalry regiment, becoming a second lieutenant. Later, he was attached to the Queensland mounted infantry and the mounted police, and was appointed to the Queensland permanent staff in 1896. In the years preceding World War I, he was adjutant general of the Australian military forces, later saw active service in Egypt and Gallipoli and was a cavalry leader in the Palestine and Syrian campaigns. He was cited in despatches nine times. Following the war, Gen. Chauvel became inspector general of the Australian military forces in 1919 and chief of the general staff in 1923, holding both posts until 1930. In World War II, he served as inspector-in-chief of the Australian home guard. He died in Melbourne, March 4.

**Cheese.** The production of cheese in the United States exceeded the total of 1944, or about 1,035,000,000 lb. in 1945 compared with 1,031,000,000 lb. in 1944 and a prewar average of 724,000,000 lb. A large part of the output was set aside for government purchase until October when restrictions on manufacture were released. The per capita consumption of

BUTADIENE was produced from normal butane in 1945, at this government-owned plant operated by Phillips Petroleum Co. Butadiene is one of the copolymers of Buna-S synthetic rubber

civilians was about 5 lb. which was near the prewar average. A subsidy of 3.75 cents per lb. to processors was discontinued in November and the ceiling price advanced in proportion. The production of cheese declined near the end of the year however, and stocks were expected to be sharply reduced at the year's end. The delay in purchasing supplies for relief purposes was a factor that caused some of the decline in production. About one-third of the stocks were government-owned in November. (See also BUTTER; DAIRYING; MILK.) (J. C. Ms.)

**Chemical Therapy:** *see* CHEMOTHERAPY.

**Chemistry.** Many of the topics covered in this report come as a result of lifting of wartime restrictions in the United States during 1945, but a large volume of non-restricted material was published also. Most spectacular from the restricted list was that dealing with the chemistry of the atomic nucleus. This work gave rise to four new chemical elements, numbers 93 to 96.

**Elements 93-96.**—Until recently the list of chemical elements began with hydrogen and ended with uranium. To appreciate the announcement of four new elements it is necessary to understand the basic features of atomic structure. An atom, the smallest unit of an element, is composed of a tiny but relatively massive nucleus and a large external sphere of influence containing relatively weightless electrons. The weight of the

nucleus is traceable to the positive charges and neutrons which are contained therein, the number of positive charges being invariable and different for each atom. The neutron is a neutral particle consisting of a positive charge balanced by a negative charge. It contributes, therefore, to the mass of the nucleus (because of its positive charge) but not to the charge of the nucleus. Electrons are negative particles. A neutral atom contains the same number of electrons outside the nucleus as there are positive charges within. An electron may be captured by a neighbouring atom in the production of molecules or ions. These external electrons are responsible for the chemical properties of an element.

Although the number of positive charges in the nucleus of an atom cannot vary, the number of neutrons may vary. Two nuclei of the same element containing different numbers of neutrons are called isotopes. It is obvious from this that isotopes of the same element have differing atomic weights, but identical chemical properties since the number of positive and negative charges is not disturbed. Isotopes cannot be separated, therefore, by chemical means.

The two isotopes of hydrogen are called hydrogen and deuterium. The nucleus of hydrogen contains simply one positive charge, whereas deuterium or "heavy hydrogen" contains one neutron in addition to the positive charge. Helium, the second element, contains a nucleus with two positive charges and two neutrons, hence an "atomic weight" of 4. Carbon, the sixth element (at. wt. 12), contains 6 positive charges and 6 neutrons. This kind of thing continues till one reaches uranium (at. wt. 238) with a nucleus holding 92 positive

charges and 146 neutrons. Chemists refer to it as element number 92 because of the 92 positive charges in the nucleus. The isotope of uranium of atomic weight 235 also is No. 92, but it contains only 143 neutrons within the nucleus. Natural uranium is a mixture containing 99.3%  $U^{238}$ , and 0.7%  $U^{235}$ , and a trace of a third isotope  $U^{234}$ .

Under "Chemistry" in the *Book of the Year* for 1941 mention was made of the decomposition of  $U^{235}$  and the tremendous power production thereby released. The "atomic bomb" was the expression of this power in 1945. To achieve this end the two isotopes of uranium had to be separated in quantity and, except for the enormous governmental subsidy of about \$2,000,000,000, such a separation would have required several decades. Since uranium hexafluoride,  $UF_6$ , exists as a gas above 56°C. it was the reference compound selected for most of the separation procedures. These physical methods, among others, were adopted for the separation of  $U^{235}F_6$  from  $U^{238}F_6$ : electromagnetic deflection (depending on molecular mass) of a beam of ionized  $UF_6$  molecules, diffusion through porous barriers permitting the lighter gaseous molecules to penetrate a little faster than the heavier ones, and thermal diffusion of uranium hexafluoride in a vertical annular tube kept hot at the core and cool at the outside thereby attracting the heavier isotope to the cooler surface.

Radium, as it decomposes, ejects from its nucleus a fast-moving helium ion known as an "alpha particle." If this helium bullet is directed so as to collide with a beryllium atom a neutron is expelled from the beryllium nucleus at high velocity. The velocity of this stream of neutrons may be moderated by passing it through heavy water, graphite, or other materials. It is this type of slow-moving neutron that causes the disintegration of uranium 235 into two smaller atoms such as barium and krypton. The energy released in this process is 5,000,000 times that obtained from burning an equal weight of coal. As a matter of fact, uranium 235 gives off neutrons spontaneously. In a pile of pure natural uranium (chiefly 238) of sufficient size these neutrons penetrate the 238 molecule to yield a short-lived isotope of uranium (at. No. 92, at. wt. 239). Heat is generated spontaneously, and one of the neutrons in this nucleus throws out its negative charge as a "beta particle," thereby increasing the number of positive charges in the nucleus from 92 to 93. The element thus formed is named neptunium. In turn, it loses another beta particle in the course of a few days, giving rise to plutonium, element 94. This element, discovered late in 1940 by G. T. Seaborg, E. M. McMillan, A. C. Wahl and J. W. Kennedy, was first obtained pure in weighable quantities in 1942 by B. B. Cunningham and L. B. Werner. Only a couple of years later it was produced industrially at Hanford, Wash. This site was selected to utilize the cooling action of the Columbia river. The construction of the massive plant at Hanford was a triumph of co-operation between chemical engineers, chemists and physicists, because its preliminary design was under way at a time when the world's supply of plutonium was invisible to the naked eye. As is well known, plutonium resembles uranium 235 in that its nucleus can be made to disintegrate by slow-moving neutrons.

Two new elements, as yet unnamed, were announced on Nov. 16, 1944, by G. T. Seaborg at a meeting of the American Chemical society held at Northwestern university, Evanston, Ill. These elements, 95 and 96, were found to be among the products produced by bombardment of uranium and plutonium with very high energy (40,000,000 electron volts) helium ions in the 60-in. cyclotron of the University of California, Berkeley, Calif.

Seaborg calls attention to the fact that in the periodic arrangement of the chemical elements those above actinium (No. 89), namely, Ac, Th, Pa, U, Np, Pu, 95, 96, seem to represent

the beginning of an "actinide" series not unlike the rare earth series from lanthanum (No. 57) to lutecium (No. 71). This provides an explanation for the general similarity in chemical behaviour of the new elements: e.g., the valences of uranium are 3, 4, 6 with 6 the most stable; neptunium, 4, 5, 6 with 4 the most stable; plutonium, 3, 4, 5, 6 with 3 the most stable; and the prediction of very stable trivalent states for elements 95 and 96.

**British Anti-Lewisite.**—The need for protection against injuries from the use of lewisite as a war gas prompted British and U.S. chemists to find an effective therapeutic agent. Announcements of the solution of this search were made by R. A. Peters and by L. L. Waters and C. Stock. Lewisite, an organic arsenical, is made by catalytic interaction of acetylene and arsenic chloride. Although lewisite was not used in World War II the antiarsenical developed proved to be of value in the treatment of types of arsenical poisoning encountered in civilian medicine. British anti-lewisite or BAL is 2, 3-dimercapto-1-propanol,  $HSCH_2-CHSH-CH_2OH$ . The method developed for its manufacture involved addition of bromine to allyl alcohol followed by reaction with sodium hydrogen sulphide at 60–70° C. under a hydrogen sulphide pressure of 100 lb. in<sup>2</sup>. Ammonium hydroxide stabilizes the substance to permit its vacuum distillation without pyrolysis.

**Sodium Fluoroacetate.**—Another discovery of wartime research which had an important peacetime application is the rodenticide "1080" or sodium fluoroacetate,  $FCH_2COONa$ . This salt is effective in water solution, and rodents find such solutions palatable. Unfortunately, the substance is extremely poisonous also to other animals such as dogs; hence it is necessary to restrict its application as a rodenticide to responsible agencies.

**Toluene from Petroleum.**—Demand for toluene during wartime is always heavy because it is the source of T.N.T. The annual U.S. production of toluene in 1918 was 15,000,000 gal., obtained almost entirely from coal tar. By 1939 the output was 30,000,000 gal., but in 1944 the quantity had skyrocketed to 250,000,000 gal. The increase came chiefly from petroleum sources by three methods: (1) about one-fifth by recovery of naturally occurring toluene from straight run and cracked naphthas; (2) about seven-tenths by dehydrogenation of methylcyclohexane, which occurs to the extent of 30–40% in feed stock from Texas petroleum. This is the "hydroforming process" of the Standard Oil Co. of Indiana; (3) about one-tenth by  $AlCl_3$ -isomerization of dimethylcyclopentane (made from light gasoline and aluminum chloride) to methylcyclohexane, then dehydrogenating the latter. This process was developed by Shell Oil Co.

Two catalysts reported to be effective for the dehydrogenation of methylcyclohexane are molybdena-on-alumina which is regenerated with air every four hours (to burn off the deposited carbon), and nickel-tungsten sulphide which is regenerated with hydrogen semiannually. The first of these catalysts was used in the hydroforming process, conditions for which were 540°C. and 250 lb. pressure. The magnitude of the installation may be appreciated somewhat by pointing out that the cost of catalyst per. charge was \$400,000, such a charge being effective for about seven months.

The toluene as produced was mixed with paraffins, cycloparaffins and olefins. Separation from this mixture was a major problem. The problem was solved by use of two new techniques: (1) extractive distillation with phenol, the latter clinging to the toluene more than to the paraffins; (2) azeotropic distillation with methanol or methyl ethyl ketone. Distillation towers as tall as an eight-story building were used in these steps, and toluene of 99% purity was obtained.

**Butadiene from Petroleum.**—During 1945 synthetic rubber

plants in the United States for government rubber containing styrene (GR-S) had an estimated capacity of 1,000,000 tons. In contrast, the best German annual production was about 17,000 tons. About one-third of the butadiene for the U.S. production came from alcohol, the remainder coming from petroleum. Butadiene from petroleum may cost 6.4 cents per lb., whereas that from alcohol is estimated at not less than 9 cents.

Refinery gases, the butanes and butylenes, were the chief source materials. The undesired isobutylene was selectively polymerized by sulphuric acid into diisobutylene, useful for aviation gasoline. The desired 1- and 2-butenes were separated from the butanes by azeotropic distillation with furfural or acetone through huge columns containing 75 bubble trays, a column being on the order of 200 ft. high and 13 ft. diameter. These butenes, mixed with steam to give a hydrocarbon partial pressure of 1 to 2 lb. per sq.in. absolute, were passed over a catalyst at 620°C. The conversion to butadiene per pass was about 25%, and separation of the butadiene was by means of azeotropic distillation with furfural or extractive distillation with cuprous ammonium acetate. The catalyst, as yet undisclosed, was regenerated periodically with hot steam which removed the carbon as carbon monoxide.

Conversion of butane to butadiene may follow either a two-step (butane to butene to butadiene), or the Houdry one-step process. Two plants were using the latter in 1945. The process called for a chromia-alumina catalyst at 595°C. and 1.5 lb. pressure. Every 7-15 minutes the carbon deposit on the catalyst burned off with air.

**Thiophene.**—Search for a new method of making butadiene from butane guided chemists at the Socony Vacuum laboratories to the discovery of a practical synthesis of thiophene. They reasoned that sulphur at sufficiently high temperatures might pull away the hydrogens of butane, to form butadiene and hydrogen sulphide. The reasoning was good because a substantial amount of butadiene was isolable under certain conditions, but the method proved to be much more attractive as a source of thiophene. A yield of 70% (by recycling) was obtainable by heating a mixture of one part of butane with 1.5 parts of sulphur at 650°C. for one-tenth of a second, followed by quick cooling. The conversion per pass was 20-24% based on butane.

Thiophene,  $C_4H_4S$ , had been primarily of interest as the impurity (0.1%) in coal tar benzene. It was fairly well studied in the six decades after its discovery, but never with anything but academic motives. Industrial utilization in 1945 seemed assured.

Thiophene resembles benzene in that it displays conventional substitution reactions with bromine, chlorine, nitric acid, or sulphuric acid; but the greater reactivity of thiophene is noteworthy. Its reactions with mercuric salts, or ethylmagnesium bromide, or acid chlorides in the presence of stannic chloride all contrast to the corresponding nonreactions with benzene. F. S. Fawcett and H. E. Rasmusson, working with purer thiophene than was hitherto available, found its boiling point to be 84.1°C. and its melting point -38.5°C.

**Organic Silicon Compounds.**—E. G. Rochow and collaborators of General Electric Co. developed a new process for making organo silicon halides which proved to be especially useful in the preparation of dimethylsilicon dichloride  $(CH_3)_2SiCl_2$ , namely, the interaction of methyl chloride with hot pellets of an alloy of silicon and copper (10% Si). Some methylsilicon trichloride and other products are formed concurrently. Interest in this compound stems from the unusual properties of the substance it yields on reaction with water. First the dihydroxy analog is produced  $(CH_3)_2Si(OH)_2$ , and it then undergoes inter-

molecular dehydration. One may visualize the first dehydration product to be of this structure:  $HO-Si(CH_3)_2-O-Si(CH_3)_2-OH$ , and the next  $HO-Si(CH_3)_2-O-Si(CH_3)_2-O-Si(CH_3)_2-OH$ , and so forth. The extent of this dehydration may be controlled somewhat, so that the products formed may vary in physical properties from light liquids to rubbery solids. This process is known as "curing." A partly cured product may be cured further by heating to 400°C., or by using such dehydrating agents as sulphuric acid or boric acid. A methyl silicone rubber, thus prepared, has several thousand  $[(CH_3)_2SiO]$ -units in its molecule. This may be used at temperatures much higher than ordinary rubber could withstand. Another interesting application was in electrical insulation. A wire wound with glass fibre and then impregnated with a partly cured silicone resin may then be cured at 400°C. to give a product which is remarkably durable at high temperature and of high dielectric quality.

**Starch.**—T. J. Schoch of Corn Products Refining Co. made the novel discovery in 1941 that corn starch could be separated fairly readily into two fractions by adding butyl alcohol to a 2% starch solution. About one-fifth of the starch solids separated. This material, known as "amylose" or the "linear fraction," is crystalline and gives an intense blue coloration with iodine. The unprecipitated portion, known as "amylopectin" or the "branched fraction," gives a red coloration with iodine. A 5% solution of amylose sets to a rigid gel, whereas a 5% solution of amylopectin remains a mobile liquid. Evidence supports the belief that amylose is a linear arrangement of glucopyranoses with glucosidic attachments at positions 1 and 4. Amylopectin is a much larger polymer with the glucose units considered to be in a branched structure. Like amylose, most of the glucosidic attachments involve positions 1,4 but occasionally position 6 (or 2) participate as well.

R. L. Whistler and G. E. Hilbert of the U.S. department of agriculture found that the triacetates of amylose and amylopectin differ greatly in film-forming ability. Brittle films are formed from amylopectin triacetate, much like the brittle films from completely acetylated whole starch. Amylose triacetate, on the other hand, readily forms films of good tensile strength and suppleness, resembling those made of cellulose triacetate.

**Acetyl Peroxide.**—Organic peroxides are used extensively to bring about the polymerization of unsaturated compounds (such as styrene, acrylic esters, allyl compounds, etc.). M. S. Kharasch and collaborators announced that in the presence of a trace of acetyl peroxide phosphorus trichloride or carbon tetrachloride can be made to add to unsaturated hydrocarbons. Kharasch regarded the acetyl peroxides as a source of methyl radicals:  $(CH_3CO)_2O_2 \rightarrow CH_3 + CO_2 + CH_3COO$ . The methyl radical soon disappears by reacting with  $CCl_4$  (or  $PCl_3$ ) to give trichloromethyl (a new radical) and methyl chloride. The olefin,  $RCH=CH_2$ , adds trichloromethyl giving  $RCH-CH_2-CCl_3$  which changes into  $RCHCl-CH_2-CCl_3$  and  $CCl_3$  by reaction with more carbon tetrachloride. The new  $CCl_3$  radical sets up a chain reaction.

Methyl radicals (from acetyl peroxide) also have been shown to cause the conversion of acetic acid ( $CH_3COOH$ ) into succinic acid  $(-CH_2COOH)_2$ ; methyl chloroacetate into methyl dichlorosuccinate; methyl succinate into methyl butanetetra-carboxylate, etc.

Alkylbenzenes (such as ethylbenzene or isopropylbenzene) were discovered to behave similarly at the relatively low temperature of 125-145°C. in the presence of acetyl peroxide. As judged by the products formed ( $CH_3CHPh-CHPh-CH_3$  from  $CH_3CH_2Ph$ ), it is evident that the methyl radical at this temperature exerts a highly specific action at the carbon atom holding the phenyl group.

**Penicillin.**—Late in Dec. 1945 the Committee on Medical

Research, Office of Scientific Research and Development, representing 21 U.S. research organizations, and the Medical Research Council, London, representing 17 British laboratories published a summary of principal findings on the structure of penicillin secured up to the end of 1944. Several antibiotics of the penicillin class have been found, all possessing the general formula,  $\text{RCO-NH}-(\text{C}_7\text{H}_9\text{ONS})-\text{COOH}$ . In what is known as F-penicillin (or penicillin-I in Britain) the RCO group is 3-hexenoyl, or  $\text{CH}_3\text{CH}_2\text{CH}=\text{CHCH}_2\text{CO}-$ ; in G-penicillin (or penicillin-II) it is phenylacetyl or  $\text{C}_6\text{H}_5\text{CH}_2\text{CO}-$ ; in X-penicillin (or penicillin-III), p-hydroxyphenylacetyl, or  $\text{HOC}_6\text{H}_4\text{CH}_2\text{CO}-$ ; in K-penicillin it is caprylyl,  $\text{C}_7\text{H}_{13}\text{CO}-$ . In dihydro-F-penicillin the RCO group represents caproyl,  $\text{C}_6\text{H}_{11}\text{CO}-$ . These structures explain the formation of phenylacetic acid, p-hydroxyphenylacetic acid, etc. as hydrolytic products of penicillin. Acid hydrolysis of penicillin was found to yield penicillamine, characterized as D- $\beta$ ,  $\beta$ -dimethylcysteine,  $\text{HSCMe}_2\text{CH}(\text{NH}_2)\text{COOH}$ . Unstable "penaldic acids,"  $\text{RCNHCH}(\text{COOH})\text{CHO}$ , were formed concurrently and these decomposed readily into "penilloaldehydes,"  $\text{RCNHCH}_2\text{CHO}$ . Thus, G-penilloaldehyde is phenylacetamidooacetaldehyde.

A thiazolidine structure (I) containing a beta lactam configuration explains these and subsequent results and was in 1945

receiving most active attention as the structure for penicillin. Opening of the 4-membered lactam ring by alkaline hydrolysis gives rise to salts of a dicarboxylic acid named penicilloic acid. The penillic acids (II) are obtained by holding penicillin at  $30^\circ\text{C}$ . in dilute mineral acids. Treatment of the penillic acids with mercuric chloride is a method used to open the S-containing ring. Carbon dioxide is detached in this process and penillamines

(III) are formed. Although the synthesis of penicillin was not announced it appears to be clear that the groundwork was established for an understanding of most of its chemistry.

**Streptomycin.**—Another antibiotic which received prominence during 1945 is streptomycin, because in contrast to penicillin it is effective towards the gram negative bacteria. It seems to be particularly effective towards tularaemia and urinary infections. Not much of it was produced, and less was known concerning its structure than penicillin, but Karl Folkers and co-workers made progress in structural studies. They concluded that it has the general constitution of a hydroxylated base named streptidine which is attached through a glycosidic linkage to a nitrogen-containing disaccharide-like molecule. The latter contains a methylamino group and a carbonyl group. The formula of streptomycin is considered to be either  $\text{C}_{21}\text{H}_{37}\text{N}_7\text{O}_{12}$  or  $\text{C}_{21}\text{H}_{39}\text{N}_7\text{O}_{12}$ . Streptidine is  $\text{C}_8\text{H}_{18}\text{N}_6\text{O}_4$ . (See also ATOMIC BOMB; PHYSICS; VITAMINS.)

## Chemotherapy.

For the first time after large-scale manufacture was begun penicillin was removed

from controlled sale and made freely available in 1945 to physicians and hospitals. This drug had been previously rationed since the supply was not sufficient to meet the demand and because the needs of the armed forces had to be met first. Such freedom of sale permitted a more widespread use of the drug. It was claimed to bring about speedy recovery in trench mouth. Its use in syphilis was continued, especially in cases of congenital syphilis. It was found to be effective in agranulocytosis, a condition in which the white blood cells decrease in number. Penicillin was found to save lives of those suffering from this disease, probably by preventing infection which apparently is the primary cause of death.

Streptomycin, which, like penicillin, is known as an antibiotic, was used in humans suffering with tuberculosis. The results were sufficiently encouraging to warrant further trial. It was also shown to have value in other infections which were immune to the action of penicillin and the sulfonamides. Streptomycin is of much value in the control of infection in the urinary tract, an illness which is especially likely to occur following injury to the spine. Only small amounts of the drug were available in 1945 and much remained to be learned about it. However, sufficient knowledge was gained concerning the chemical structure to justify hope that the drug might soon be made synthetically, in which case the supply would be plentiful.

At the end of the year 1945 considerable publicity was given to a wartime secret involving an alcohol (2,3 dithiopropanol) called BAL. This name was derived from British anti-lewisite because the material was developed as a treatment for lewisite, a war gas poisoning. The British shared their secret with the Americans, to learn that it could be injected to counteract arsenic poisoning such as may occur in patients being treated with arsenic for syphilis. They also learned that it may be of value in the treatment of mercury poisoning which, if substantiated, is of considerable importance because of the frequency with which mercury poisoning follows accidents with mercury bichloride, a poisonous substance often used as an antiseptic and disinfectant. BAL acts, at least in part, by combining with the arsenic and forming a new compound which can be excreted from the body.

A careful study was made of more than 5,000 cases of thyroid gland disease which had been treated with thiouracil, a drug released for sale in Jan. 1946. Until this study was completed it was difficult to determine the real value of the compound since it has dangerous possibilities even when used carefully. However, the drug was shown to have more than sufficient value to offset its dangers, and it provides a means of saving the lives of many patients suffering from hypothyroidism (excessive activity of the thyroid gland) who cannot be helped by operation. The unique feature of the study is the way in which it was done: manufacturers of the product, the Food and Drug administration and clinicians who had studied the compound pooled their knowledge, which was submitted in a report to the Council on Pharmacy and Chemistry for publication so that all physicians could be informed concerning the proper use of thiouracil before the drug was released in interstate commerce. Never before had there been such a co-operative project. Another drug claimed to be useful in the treatment of hypothyroidism is thiobarbital, which also has a slowing down effect on overactive thyroid glands.

Cholera was successfully controlled by administering blood plasma, salt solution and sulfadiazine. The blood plasma is used to dilute the concentrated blood which occurs in this disease; the salt solution to supply fluids for the body which are lost in enormous quantities and which account for the thickening of the blood; and sulfadiazine to counteract the organism responsible for the disease. Formerly almost half, and even

more at times, of the victims died. With the new treatment it appeared as if most sufferers would be saved.

Late in the year influenza vaccines were made available for civilian use. For the first time civilians appeared to have a vaccine which would permit them to acquire immunity to influenza, at least against Types A and B influenza. According to army studies, as high as 75% of those vaccinated may be protected in varying degrees, although it was not known how long the immunity would last. Another measure of immunity to become more generally available was that concerned with measles protection, it being provided by the injection of globulin, a substance derived from the serum fraction of human blood. Supplies were made available throughout the country through the co-operation of the American Red Cross, which was responsible for collecting the blood, and manufacturers, who processed the blood.

Various authorities agreed that vitamin D may play an important role in the prevention of dental caries and recommended that its importance be considered in programs designed to prevent or lessen tooth decay.

A new drug, tridione (3,5,5-trimethyl-oxazolidine-2,4-dione), was used in the treatment of petit mal epilepsy and found worthy of further investigation.

Another new drug still in need of more study, but in an entirely different medical field, is benadryl which was suggested for hay fever and other forms of allergy. Unfortunately, it causes a sedative action, mental confusion and disturbances of vision.

Chaulmoogra oil and a chemical salt known as ethyl chaulmoograte were used with doubtful success for the treatment of leprosy. On the basis of recent evidence a compound known as promin, a member of the sulfone series and a distant relative of the sulfonamides ("sulfa" drugs), was hailed as the most effective compound yet made available for the treatment of leprosy. It also needed further study to clarify its real value.

Curare, an old Indian arrow poison, was broken down chemically to provide pure substances which could be injected to cause relaxation in body muscles. It was used to overcome abnormal stiffness or spasticity which occurs in certain diseases and to obtain greater muscle relaxation with less anaesthesia during operations.

Because of the seriousness of fungus infections of the feet and body, especially in the armed forces, much attention was given to this problem. Few remedies were found to be of worthwhile value until a mixture of undecylenic acid (a fatty acid found in perspiration), zinc undecylenate and talc was tested. This compound was shown to have marked effect on fungi and to be the most useful preparation yet available for controlling fungus infections.

Attention was focused on the technique of injecting food substances in the presence of food deficiencies. Sugar, salt, vitamins and even protein can be administered into a vein and used by the body to overcome depleted reserves, a procedure of considerable value in the presence of starvation, lasting illness and severe operation. The role of food material given by injection is important since even the most potent drugs have limited value if the patient has no reserves which his body can use for normal recovery. Medical literature contains at least one report of a man being fed entirely by vein for eight weeks.

Tropical diseases were the object of a renewed onslaught of investigation because of their wartime and peacetime importance. The advances made in chemotherapy in this field were not as great as were hoped for and the results could not be made public until all secrecy of wartime research was lifted and the experimental observations made generally available. Virus diseases were also subjected to much study, this work being aug-

mented by knowledge concerning antibiotics and the electromicroscope. Once again a final report on this work had to await the availability for co-ordination of all the research that was undertaken and completed during World War II. (See also DENTISTRY; MEDICINE; PNEUMONIA; SURGERY; UROLOGY; VITAMINS.) (A. E. SH.)

**Chemurgy.** Florida was a notable scene of chemurgic accomplishment in the United States in 1945. A new use for an old crop, sweet potatoes, made its largest commercial advance. A new crop, ramie, first began to push into substantial acreages.

Both these developments took place in the Everglades section. At Clewiston the United States Sugar corporation completed, and at the year's end had ready to put into operation, a \$7,000,000 plant for extracting starch from sweet potatoes. Annual production was expected to be 75,000,000 lb. of starch materials and 30,000,000 lb. of livestock feed. New employment for 2,500 workers was promised.

The crop from 15,000 ac. was to be required to supply 40 freight carloads of sweet potatoes which the plant's daily operations required. A special variety of large size with high starch content was bred for production on the Everglades soils. They are planted in the fall and left in the ground until needed, since the crop is not damaged in that area by freezing. Yields average more than 20 tons per ac.; the maximum was 39 tons. More than 20% of the content is starch.

The six-acre plant at Clewiston included one notable new method in starch production. Previous plants, such as the one at Laurel, Miss., where much experimental work had been done by the department of agriculture, utilized settling tables to recover the starch from the mashed pulp. The Clewiston plant used centrifugals instead, achieving greater speed and efficiency in far less space.

Sweet potato starch was expected to compete with the tropical root starches, cassava, tapioca and arrowroot, which had been heavily imported from the East Indies. Imports in 1939 approached 500,000,000 lb. For certain uses in the adhesive and textile industries the root starches were preferred to corn starch.

Waxy corn, however, a new variety, yields a similar starch. The previous maximum of 15,000 ac. of this variety was increased substantially in 1945, principally in Illinois and Iowa. The product was marketed principally as a tapioca substitute.

CHICKEN FEATHER YARN, an experimental project of the U.S. Rubber Co. in 1945. The yarn was expected to provide cloth rivalling wool in lightness and warmth, and to utilize millions of pounds of feathers otherwise scrapped each year

The second significant development in Florida was with a fibre crop. This was ramie, long known in the orient, but only currently finding a commercial foothold in the United States. Heretofore ramie had been available only after costly and inefficient hand processes. Perfection of machines that effectively and economically decorticate and degum the fibre opened the way to large-scale domestic production.

Ramie was described as the most remarkable of all natural fibres. Lustrous and silky in appearance when fully degummed, it blends well with other fibres. When woven with wool the fabric will not shrink. When wet, ramie is a half stronger than when dry, and it is eight times stronger than cotton or silk. Practically immune to mildew, it washes well, absorbs more water than cotton, dries quickly and gives off no lint. It takes commercial dyes well and is said to be superior at holding colour.

The plant will grow wherever the ground freezes no more than two or three inches deep, but makes its greatest growth naturally in such a relatively frost-free area as the Everglades. There it may be seen as an upright stalk five to eight feet high. It grows from roots from which three or more crops may be taken annually for seven or eight years, when replanting usually becomes desirable. An optimistic view, perhaps justifiable, was that once ramie became well known the demand would make its production profitable even in such areas of lower yield as the southern fringes of the cotton belt.

The acreage actually planted by the close of 1945 and contemplated for early 1946 was probably in excess of 5,000. Two substantial processing plants were being erected, one by the Florida Ramie Products company near Belle Glade and another by Newport Industries, Inc., near Pahokee.

All but a small proportion of the feathers removed from dressed poultry had always been a complete waste. Disposal of the 50,000 to 75,000 tons thrown away yearly had been a nuisance. Two 1945 discoveries in chemurgy promised to convert this agricultural waste into a source of income.

First it was found that by a cheap chemical solution wet feathers could be prevented from decomposing. This allowed their preservation and transportation, both previously difficult.

Then it was found that after mechanical removal from the quills, which are discarded, the barbs could be reduced by weight to a heavy syrup. This, when extruded through spinnerets, such as are used in making rayon and nylon, appears in the form of fibres which can be stabilized in a chemical bath and made into yarn. Three-fourths of the feathers from each fowl and four-fifths of each feather are said to be usable.

The yarn was woven into an odourless fabric which is lustrous, softer and lighter than wool and readily dyed. Feathers, like wool are of protein character. Mixed with other fibres the feather fabric is attractive in appearance.

The feather research program was conducted in part by the Western Regional laboratory of the department of agriculture and in part by the United States Rubber company. Although it exhibited the product in public, the company expected to conduct further experimentation before commercial production was recommended.

The three principal advances in the field during 1945 represented each of the three major divisions of the farm chemurgic concept: sweet potato starch, a new use for an old crop; ramie, a new crop; fabric from feathers, an economic utilization of an agricultural waste.

FILMS.—*Science and Agriculture* (Encyclopædia Britannica Films Inc.). (W. McM.)

**Chennault, Claire L.** (1890— ), U.S. army air officer, was born Sept. 6 in Commerce, Tex. A school teacher during World War I, young Chennault was called up for service in 1917 and served in the aviation

section of the signal reserve corps in the United States. After the war, he became an officer in the army air corps and commanded a pursuit squadron in Hawaii 1923–26. He retired from the army in 1937 and in the same year accepted General Chiang Kai-shek's offer to become aviation adviser to China; he then helped the Chinese to create an air force to fight the invading Japanese. In 1941, he founded the American Volunteer group of the Chinese army—a flying squadron of U.S. volunteer aviators who later became known as the "Flying Tigers." Though seriously hindered by inferior planes, the "Flying Tigers" reflected their superior training under Chennault by repeatedly repulsing Japanese air attacks on the Burma road—then China's lifeline. Chennault was called back to active duty with the U.S. army air force on April 16, 1942. On July 14, 1945, Chennault announced his resignation as commander of the U.S. 14th air force. He retired from active duty late in 1945 and then went to China, reportedly as adviser on commercial aviation to the Chungking government.

**Chernyakhovsky, Ivan Danilovich** (1907?–1945), Russian army officer, was born in Uman in the Ukraine, the son of a railway worker. Orphaned while a child, he worked as a cowherd and later as a longshoreman in Novorossisk. By good fortune, he was able to attend a military school and there was grounded in the fundamentals of strategy that stood him in such good stead during World War II. Chernyakhovsky was a colonel when the Germans invaded Russia in June 1941. He covered himself with distinction during the fighting on the Western Dvina in the summer of 1941, and a year later he was promoted to the rank of major general. In Feb. 1943 he led the soviet forces that broke through the German hedgehog defenses at Kursk. For this achievement, he was made a colonel general. By the spring of 1944, he had been promoted to the rank of army general and had been given command of the 3rd White Russian army. His forces, in conjunction with Gen. Ivan Bagramyan's army, cleared the Germans from White Russia. By autumn Chernyakhovsky had reached the approaches to East Prussia, and in Oct. 1944 his were the first Russian troops to cross into German territory on the eastern front. During the great offensive that started in Jan. 1945, Chernyakhovsky's armies conquered nearly all of East Prussia and he was about to complete this task when he died, Feb. 18, from a wound received in battle.

**Cherries:** *see* FRUIT.

**Chess.** The "Big Four" of U.S. chess—Arnold S. Denker, Anthony E. Santasiere, Reuben Fine and Samuel Reshevsky—continued their dominance of men's championships during 1945. Denker of Forest Hills, N.Y., defended his championship in the national tournament, while Santasiere, a New York city school teacher, won the open championship of the U.S. Chess federation with eight victories and three draws. Fine, the Washington, D.C., speed specialist, won his fourth straight rapid transit title, and Reshevsky, seven-time national champion from Boston, won the Pan-American tournament. George Kramer, 16-year-old youth from Rego Park, L.I., won the New York state title, while Paul R. Ellis of New York won the U.S. amateur.

Mrs. Gisela Kahn Gresser of New York successfully defended her women's national championship, while the Pan-American tournament ended in a tie between Mrs. Mary Bain of Miami, Fla., and N. May Karff of Boston.

The United States was soundly beaten, 15½ to 4½, in a ten-man radio match with Russia. Extensive international competition was planned for 1946, including tentative arrangements for a

U.S. team to play in Russia. The board of directors of the U.S. Chess federation also announced the first world chess tournament after 1939 would be held in 1946 in Buenos Aires, Argentina. Dr. Alexander Alekhine of Paris won the world tournament in 1939.

(M. P. W.)

**Chiang Kai-shek** (1887- ), Chinese statesman and soldier, was born Oct. 31 at Feng-hwa, Chekiang. As president of the Chinese republic, commander in chief of all military forces and director general of the Kuomintang, devoting his life to China's struggle for independence and freedom and leading the Chinese people through black and helpless days and eight long years of resistance against aggression, he was greatly gratified and elated with Japan's acceptance of the unconditional surrender terms laid down in the Potsdam proclamation. In his victory message of Aug. 15, 1945, Chiang stated that the Chinese faith in justice had been rewarded. However, as a realist, Chiang regarded victory as not yet final and was fully aware of the difficult problems of national unity and reconstruction confronting him. Determined to preserve national unity and terminate the period of political tutelage, he announced in his 1945 New Year's message that a constitutional government should be established before the end of the war instead of within one year after the war. In an interview on Jan. 18 of that year Chiang reiterated that the differences between the government and the communists would be settled peaceably and added that there would be no civil war so long as he was head of the government. After the breakdown of the negotiations between the government and the communists, Chiang declared on March 1 that, "Today, but for the Communists and their armed forces, we are a united nation." Rejecting the communist proposal of a coalition government, Chiang urged the communists to incorporate their army and local administration into the national army and government. This speech evoked an open attack by the communists. This was the first time during World War II that any group publicly denounced Chiang. Upon Chiang's repeated invitations, Mao Tse-tung, the communist leader, arrived in Chungking on Aug. 28 to negotiate. As the year ended Chiang's passionate desire to create a united, strong and democratic China was far from

fulfilled.

Chiang was educated in China and Japan and rapidly rose to power after 1926. In 1927 he married Mei-ling Soong and established the national government in Nanking following his split with the Chinese communists. After 1927 Chiang was continuously in power, and through the eight years of war he was the leader and symbol of a resurgent China. (See also CHINA.)

**BIBLIOGRAPHY.**—Chiang Kai-shek, *Resistance and Reconstruction* (speeches 1937-43) and *Before Final Victory* (speeches 1943-44); R. Berkov, *Strong Man of China*; Hollington Tong, *Chiang Kai-shek*. (H. T. CH.)

**Chicago.** Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., at the southwest corner of Lake Michigan, Chicago is the largest centre of U.S. rail traffic and of long-distance air routes. Mayor in 1945: Edward J. Kelly.

The population of the city proper by the federal census of 1940 was 3,396,808. The white population numbered 3,115,379; non-white, 281,429. The population of the 1,119 sq.mi. comprising the metropolitan district was 4,499,126.

Combined civilian and military population of the Chicago area was estimated at 4,850,000 at the end of 1944 by the federal reserve bank. Return of approximately one-third of the 450,000 persons who entered the armed forces from the Chicago area was offset by departures of civilians leaving war industries and by reduction of military establishments.

Demobilization and reconversion of war industries had reduced the total working force of the area from 2,300,000 on Jan. 1, 1945, to 2,262,000 on V-J day. The industrial force had increased by 1,880,000 from 1940 to the end of World War II. Industrial output in the same period had increased 200%.

At the end of 1945 rapid progress had been made in turning industries to peacetime production and employment had steadied. Lack of building materials retarded construction, however, and the city suffered a severe housing shortage.

Strikes increased sharply after V-J day. During 1945, 178,000 workers were on strike in 415 plants compared with 80,500 in 233 plants in 1944. Most of the strikes were of short duration and orderly. Of those who walked out, 114,260 were members of the C.I.O., 48,168 of the A.F. of L., 15,505 of independent unions and 728 of no union affiliation. The most serious disturbance was from the strike of an independent teamsters union which tied up 6,000 trucks for 11 days. This strike was put down by the army which moved in troops and manned trucks.

Paralleling industrial growth, the city's financial resources were largely enhanced. At the close of 1945 Chicago bank deposits totalled \$8,597,676,000, nearly \$1,000,000,000 more than in 1944. Savings deposits amounted to \$1,270,969,000 showing a gain of \$279,000,000 during the year.

Chicago crimes in 1945 numbered 38,533, an increase of 10% over 1944. Murders numbered 204, only two more than in 1944, but rapes increased to 310 from 264 and burglaries from 9,502 to 10,962.

The divorce suits filed in 1945 exceeded all previous yearly records, totalling 19,430 or 15% more than in 1944. Decrees exceeded the number granted in any other year by 1,000.

By a vote of 285,596 to 46,594 the people on June 8 established a Metropolitan Transit authority to buy and operate the city's bus lines, street railways, subways and elevated lines. At the close of 1945 negotiations were virtually complete for the inauguration of municipal ownership.

At the same election the park board was authorized to provide 23 additional large parks, 127 20-acre playgrounds and 560 smaller play spots at an ultimate cost of \$60,000,000 for the 15,000 ac. involved.

The city's policy of providing free lodgings, food and transit

GENERALISSIMO CHIANG KAI-SHEK, broadcasting over the "Voice of China" on Aug. 15, 1945, announced the surrender of Japan and an end to eight years of war with Japan

to members of the armed forces was continued throughout 1945 and a total of 19,000,000 visits to U.S.O. centres had been attained by Dec. 22, 1945.

Budgets for the various branches of municipal government for 1946 were set as follows: city operating budget \$69,397,488; school board \$78,879,654; park board \$23,390,822; sanitary district \$59,453,669 (including \$25,359,161 new construction); Cook county \$25,688,000. Long range projects under way in the Chicago area under joint city and state auspices included highway reconstruction \$287,219,500; Congress street super highway \$45,000,000; new airport \$40,000,000. (L. H. L.)

**Chicago, University of.** An institution of higher education and research in Chicago, Ill. Founded in 1891, the university is privately endowed, co-educational and nonsectarian. In the academic year 1944-45, the university conferred 1,111 degrees, of which 585 were bachelor's (including 231 bachelor's degrees for general education conferred by the college, which admits students into its four-year program after the sophomore year of high school); 258 were master's degrees in the arts and sciences; 72 were doctor of philosophy degrees; and 196 were professional degrees in business administration, divinity, law, medicine and library science.

After exclusion of income from auxiliary enterprises and restricted expendable funds, as well as most of the income received and paid out on numerous contracts with the United States government for war purposes (all nonprofit undertakings) the estimated regular budget income for the year 1945-46 was \$10,296,491, an increase of \$1,293,706 over the previous year's actual income of \$9,002,785. The total current income for the year 1944-45, before the exclusions mentioned above, was \$32,616,357. Gifts for all purposes for 1944-45 amounted to \$2,361,944, an increase of 28.9%. Endowment funds as of June 30, 1944, were \$70,856,444; and the book value of all university assets was \$136,626,038.

After the atomic bombs were dropped on Japan, the U.S. war department revealed that the University of Chicago, through its metallurgical laboratory, was one of the major centres of research in the development of the bomb. This work, of the most secret nature, was first carried on under the auspices of the Office of Scientific Research and Development and later under the Manhattan district of the army engineers. The atomic age began Dec. 2, 1942, when physicists achieved release of atomic energy in a self-sustaining nuclear chain-reacting pile in a squash rackets court in the west stand of Stagg field. Operated at a low level, this pile served as the prototype of a pilot plant at Oak Ridge, Tenn., and of the vast production plant at Hanford, Wash. The metallurgical laboratory, directed by Arthur H. Compton, Nobel prize winner, and Charles H. Swift, distinguished service professor of physics, engaged the services of most of the members of the university's department of physics and chemistry, but it was fundamentally a great co-operative effort of the army, university scientists and industrial organizations of the U.S., engineers, industry and public agencies. Members of the metallurgical laboratory, in addition to their key achievement of the self-sustaining pile, determined the chemical properties of plutonium; devised a method of its chemical separation from uranium and fission products and in general solved the problems involved in mass production of plutonium. All this work was carried on with submicroscopic amounts of plutonium by means of "tracer" chemistry, and the step from this laboratory study to the design of the Hanford works based on it was of the order of 10,000,000,000 times. In the laboratory, Dr. Glenn T. Seaborg of the University of California and others identified two new transuranic elements, numbers 95 and 96. In

addition to directing the metallurgical laboratory, the University of Chicago operated a pilot plant on a site made available to the government by the Cook county board of forest preserve commissioners; operated the Clinton semiworks at Oak Ridge; and co-operated with the DuPont company in designing the production plant at Hanford.

Because of the important implications of the work in nucleonics, not only in nuclear energy, but in biology, medicine and other areas, the university made plans to continue fundamental research in this field. It organized the Institute of Nuclear Studies and appointed to it Enrico Fermi, professor of physics, who won the Nobel prize for his studies of the atom; Harold C. Urey, professor of chemistry, Nobel prize winner for his work on heavy water; Edward Teller, professor of physics, from George Washington university; Walter H. Zinn, associate professor of physics, College of the City of New York; Maria G. Mayer, research associate in physics, from Columbia university; Philip W. Schutz, professor of chemical engineering, from Columbia university and others. Samuel K. Allison, member of the Chicago faculty from 1929 and professor of physics, was made director. Two other organizations were formed, the Institute of Radiobiology and Biophysics, directed by Raymond E. Zirkle, professor of botany, and the Institute of Metals, directed by Cyril Smith, formerly research metallurgist of the American Brass company.

During 1945 an administrative reorganization of the university was effected to form a central administration office which would enable the university to deal more efficiently with the many matters an institution of its size faces. Robert M. Hutchins, president, was made chancellor of the university and its principal officer; Ernest C. Colwell, formerly vice-president, was elected president; Reuben G. Gustavson, formerly president of the University of Colorado, was named vice-president and dean of faculties; Wilbur C. Munnecke continued as vice-president in charge of business affairs; and Neil H. Jacoby, formerly secretary of the university, was made vice-president in charge of development. William Benton, formerly vice-president, was elected assistant to the chancellor at his request, because of numerous activities off campus, but shortly after his election resigned to become assistant U.S. secretary of state.

In the area of academic administration, a new constitution was adopted which added to the university senate, formerly limited to full professors, the associate professors and those of the assistant professors who had been faculty members for three years.

Because of rising costs, the university in June 1945 increased tuition rates on an average of 10%, and consolidated incidental student fees. One of the most pressing of the postwar problems was that of providing housing for the number of students seeking entrance. Despite energetic efforts, it was impossible to provide living quarters for all of the students qualified to enter. The number of veterans registering in the autumn quarter under the "G. I. Bill of Rights" was 514, and under the Vocational Rehabilitation bill was 38.

(For additional statistics of enrolment, faculty members, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

**Child Labour:** see CHILD WELFARE.

**Children's Books.** Children's book publishing in the United States during 1945 exceeded that of 1944, in the first 11 months of the year, by less than a score of titles, for in 1945 there were 604 juvenile books pub-

Map of *Alice in Wonderland* and *Through the Looking Glass*, designed by Richard Bennett and published and copyrighted in 1945. The drawings are based on those of John Tenniel and follow Alice's adventures, which are numbered and identified by quotations below the map (quotations not given here)

lished as against 585 in 1944. The wartime format remained much the same, the poorer quality of paper, narrow margins and thinness in the physical size of books for older children, but colour predominated in the picture books. Outstanding in the effective use of colour were *Little Lost Lamb* by Golden MacDonald, *Into the Ark* by Marjorie Hartwell and *The Little Fisherman* by Margaret Wise Brown. Picture story books were Winifred Bromhall's *Belinda's New Shoes*, Elizabeth Hamilton's *The P-Zoo* and Dorothy Lathrop's *The Skittle-Skattle Monkey*. Two picture books had a Russian theme, Rebecca Reyher's *My Mother Is the Most Beautiful Woman in the World* and Lee Kingman's *Ilenka*. The train-minded boy enjoyed *Railroad ABC* by Jack Townend, *Clear the Track* by Louis Slobodkin and *The Little Red Engine Gets a Name* by Diana Ross.

An interest in the daily activities of children of other countries was reflected in *Little Boat Boy* by Jean Bothwell, *Jungle Boy* by Lysle Carveth and *Gold of Glanaree* by Maura Laverty. The beginning of the China trade was told by Carl Carmer in *Wildcat Furs to China*, while the U.S. in the early 1900s was found in *Sibby Botherbox* by Mabel Leigh Hunt and *Strawberry Girl* by Lois Lenski. Family life in the U.S. characterized *The Burro of Barneget Road* by Delia Goetz and *The Mitchells* by Hilda Van Stockum; Maine was the setting for Berta and Elmer Hader's *Rainbow's End* and humour was the keynote of Phil Stong's *Censored, the Goat* and Myra Richardson's *The Mule Skinners*.

Older boys read *Smoke Jumper* by Marjorie Hill Allee and *Wings over the Desert* by Graham Dean, while their preference for dog stories was satisfied with *Brave Companions* by Ruth Knight and Stephen Meader's *Skipper's Family*.

Historical stories for older boys had a wide range in period, witness Herbert Best's *Border Iron*, Katharine Gibson's *Arrow Fly Home* and Magdalen King-Hall's *Sturdy Rogue*. Girls enjoyed stories of the U.S. past in *Harvest of the Hudson* by Erick Berry, *Jonica's Island* by Gladys Malvern and *The Year Without a Summer* by Ethel Parton, as well as in Martha Kiser's *Sylvia Sings of Apples* and in Marjorie Hayes' *Green Peace*.

Two books of special interest were Steingrímur Arason's *Golden Hair* and Florence Hayes' *The Eskimo Hunter*, while Evelyn Stefansson's *Within the Circle* covered the Arctic regions.

The desire for stories of girls of today was met by Adele DeLeeuw's *With a High Heart*, Mary Margaret McBride's *Tune in for Elizabeth* and Noel Streatfield's *Theatre Shoes*, as well as by Elizabeth Janet Gray's *Sandy*.

The World War II background was found in *Heroes in Plenty* by Theodora Dubois and *Reunion in Poland* by Jean Karsavina.

*Here Is India* by Jean Kennedy and *The Land and the People of India* by Manorama Modak were timely. Cornelia Spencer in *The Land of the Chinese People* and Katherine Shippen in *New Found World* contributed two notable books on China and South America. The interest in nonfiction was further evidenced by Jeanne Bendick's *Making the Movies*, John Floherty's *Flowing Gold*, Jo and Ernest Norling's *Pogo's Mining Trip* and Alex

Novikoff's *Climbing Our Family Tree*. Lena Barksdale's *That Country Called Virginia* was a regional history. Animals and nature were the subject of Clarence Anderson's *A Touch of Greatness* (horses), Gladys Cook's *American Champions* (dogs), Dorothy Hogner's *Farm Animals* and Jannette Lucas' *Indian Harvest*.

The field of biography stretched from *Lenin* by Nina Brown Baker, *Garibaldi* by Jean Burton, *American Emperor*, the story of Dom Pedro II of Brazil by Rose Brown, to Daniel Webster in *Keep My Flag Flying* by Mary Carroll, Patrick Henry in *Son of Thunder* by Julia Carson and Joseph Jefferson in *Good Troupers All* by Gladys Malvern. Laura Long's *Square Sails and Spice Islands* was of the Perry family, Arna Bontemps's *We Have Tomorrow* was short biographies of 12 outstanding Negroes and Charlie May Simon's *Art in the New Land* presented sketches of 16 U.S. artists.

Tolerance, understanding of minority groups and democracy at work characterized books from the youngest to the oldest reader, as in Lorraine and Jerrold Beim's *Two Is a Team*, Georgene Faulkner's *Melindy's Medal* and Jesse Jackson's *Call Me Charley*. Irmengarde Eberle's *The Very Good Neighbors*, Doris Gates' *North Fork* and Florence Crannell Means' *The Moved-Outers* were sincere and forthright. John Tunis wrote *A City for Lincoln* and the Literature committee of the Association for Childhood Education edited *Told Under the Stars and Stripes*. Art by children in Russia was the theme of *Little People in a Big Country* by Norma Cohn. A dramatization of *Caddie Woodlawn* by Carol Brink and an anthology *Very Young Verses* by Barbara Geismer and Antoinette Suter further reflected the arts. *You Can Write Chinese* by Kurt Wiese, *Let's Do Better* by Munro Leaf and *We Are the Government* by Mary Elting satisfied a variety of interests.

Modern tales of whimsy and magic were *The Plain Princess* by Phyllis McGinley and *Stuart Little* by E. B. White. Traditional folk literature was represented by 9 *Cry-Baby Dolls* by Josephine Bernhard, *John Henry and the Double Jointed Steam Drill* by Irwin Shapiro, *True and Untrue* by Sigrid Undset and *Koos the Hottentot* by Josef Marais. (See also BOOK PUBLISHING; PRIZES OF 1945.) (E. A. Gs.)

## Child Welfare.

The devastating effect of the war on children was summed up at the International Labour conference (Paris) in the fall of 1945 in the following words:

"Millions of children have died under enemy oppression and millions of others face a seriously compromised future since, in each of the occupied countries, countless numbers of children and young people have suffered from undernourishment and neglect, from the loss of parents, friends and homes, from the horrors of concentration camps and the slavery of labour camps, from the complete lack of opportunities for educational, social and cultural development, or, uprooted from their own countries, have lost their nationality and even their identity."

Moreover, because of disrupted transportation facilities, lack of machinery and the physical and spiritual exhaustion of the people, relief and reconstruction proceeded slowly for the most part in war-torn areas and the sufferings of the war years continued.

The United Nations Relief and Rehabilitation administration, operating in central, eastern and southern Europe, supplied food, drugs, seeds and other necessities; it maintained camps for displaced persons; it took measures for the improvement of public health; and it established milk stations, day nurseries, children's hostels and welfare stations for mothers and children. It also sent emergency relief supplies to Belgium, France, Luxembourg, Netherlands and Norway and to China and the Philippines, assisted in procuring supplies for countries not requir-

ing its financial assistance, such as Denmark and administered camps for displaced persons in Germany and the middle east.

The Food and Agriculture Organization of the United Nations, first permanent United Nations organization to be established, aimed through developing an adequate and suitable food supply for all peoples, to improve the average health, eliminate deficiency diseases and further decrease maternal and infant mortality.

**In Countries Devastated by War.—Belgium.**—Although underfeeding, tuberculosis, forced labour and other conditions associated with war and armed occupation had serious effects on children and young people, rapid progress was being made by Belgium in reconstruction by the fall of 1945. One measure of value for children was a social-insurance order effective on Jan. 1, 1945, raising allowances for children, with double benefits for orphaned children.

**China.**—It was estimated in the spring of 1945, that there were 84,000,000 displaced persons, many of them children, in China. The government had set up institutions caring for 200,000 children, and industrial co-operatives were caring for 500,000 refugee children. A hundred thousand tons of food, clothing and medicines supplied by U.N.R.R.A. reached Chinese ports about the end of 1945.

**France.**—A slight improvement over the winter of 1944-45 was noted in the fall of 1945, in France, but there was still a great shortage of fuel, food and other necessities. Infant mortality was from two to three times higher than before the war. Grave malnutrition and tuberculosis were prevalent. To check the spread of tuberculosis the government ordered periodic physical examination of all school children. Of great concern was the social maladjustment among adolescents. To check juvenile delinquency a law of 1945 provided for separate juvenile courts, the appointment of trained probation officers and the use of educational measures instead of penalties. A department of families and population was established in 1945. Provision was made for larger family allowances and for an increase in the birth bonus for the first child in a family.

**Germany.**—In Germany, where the university towns of Heidelberg and Bonn only were spared destruction by bombing, the urban population struggled to exist in the midst of rubble and ruin. Minimum rations were issued to civilians by military authorities and relief organizations. Some 1,300,000 displaced persons, including about 100,000 children under 14, were still in assembly centres under the care of U.N.R.R.A. in the fall of 1945.

**Great Britain.**—The raising of the school-leaving age in England and Wales to 15 years, as prescribed by the Education act of 1944, was postponed until April 1, 1947, because of the shortage of teachers and of school accommodations. In Scotland the Education act, 1945, provided for the raising of the school-leaving age to 15 years on April 1, 1946, and to 16 years subsequently, and the education authorities were required to prohibit or restrict the employment of children of school age. The British Family Allowances act of 1945 provided for payment to the parents of an allowance of five shillings a week for each child, except the first, below school-leaving age. In Dec. 1945 announcement was made that compulsory registration of 16-year-old boys and girls for premilitary training and service was discontinued. Strict rationing of food and clothing was continued.

**Greece.**—In Greece, victim of three successive military occupations and of civil war, out of 7,500,000 inhabitants, 1,200,000 were homeless, 400,000 had tuberculosis and 2,500,000 had malaria, according to government reports in the fall of 1945. U.N.R.R.A. assumed responsibility for relief and rehabilitation in Greece in April 1945. In addition to procuring and distribut-

ing food and clothing for children, U.N.R.R.A. assigned two child-welfare specialists to help the Greek ministry of social welfare organize a bureau of child welfare. A technical committee on child welfare was also set up to co-ordinate services for children. Colonies for debilitated children were opened where 35,000 children at a time could spend three weeks.

*Italy.*—Many Italian towns were practically demolished, leaving 8,500,000 people homeless, according to the Italian government delegate to the International Labour conference in Oct. 1945. Shortages of raw materials, wheat and fuel were serious. Many schools had been requisitioned, and young people were finding great difficulty in readjusting themselves to school life. Juvenile vagrancy was a serious problem in cities. Attempts were being made to improve the condition of nonagricultural workers by granting a cost-of-living allowance to their dependents. Italy was receiving assistance from U.N.R.R.A. including extensive school-lunch and other feeding programs for children and pregnant women.

*Netherlands.*—Although the Netherlands made rapid strides in recovering from the terrible winter of 1944-45 when the Germans flooded extensive territory and civilian transport was paralyzed by a railway strike undertaken voluntarily in co-operation with the Allied military authorities, acute shortages still existed in housing, fuel and food in the fall of 1945. Infant mortality was said to be nearly four times the normal figure.

*Philippine Islands.*—As a result of the Japanese occupation of the Philippines, livestock and fishing boats and gear were lost and food production was greatly reduced. After liberation

the Philippine government administered relief with the co-operation of the U.S. military forces. During the spring of 1945 approximately 7,000 U.S. citizens, including some children, were repatriated from the Philippines. They received immediate assistance in the form of cash, clothing, medical care, transportation, living quarters and counselling services through the Social Security board's civilian war-assistance program administered by state public welfare agencies with the assistance of the American Red Cross.

*Poland.*—The Polish minister of labour and social welfare reported in Oct. 1945 that of Poland's 7,000,000 children under 14 years of age, 650,000 were full orphans; 300,000 were separated from their parents, many of whom had presumably perished; 1,000,000 had lost one parent; and 2,000,000 children with their parents were in need of food and clothing.

*Soviet Union.*—In the soviet union 11,000 maternity beds, 28,000 places in day nurseries and 1,500 health centres for mothers and children were added to existing facilities. Medical supervision of expectant mothers was made available earlier in pregnancy than had been the practice. The opening of a new type of maternity home, "the home for the mother and child" was reported, where women could stay three months before childbirth and three months afterward with their babies. Committees on children's vacation camps were set up as agencies of the municipal governments. To protect the health of employed youth a census of young workers was taken in many localities, physicians were appointed to give them periodic examinations and care for their health, medical treatment was provided if necessary and measures were taken to improve their living conditions. The civilian food situation improved somewhat in 1945 and further improvement was expected during the first half of 1946.

In the Americas.—Fortunate enough to escape both bombing and military occupation, the children of the Americas nevertheless felt the impact of war through food restrictions, through housing shortages, through family strains and dislocations and in many cases through the death or injury of the father or other relative in the armed forces. Even before the end of the war, however, plans were afoot to improve the health and welfare of children in the postwar period.

Two inter-American conferences were held at which child welfare was a subject of consideration: the First Pan American Congress of Social Service in Santiago, Chile, Sept. 1945, and the Inter-American Conference on Problems of War and Peace (g.v.) held in Mexico City, Feb. 21 to March 8, 1945. The declaration of social principles of America,

AMERICAN CHILDREN, born in Bilibid prison, Manila, are shown with their mothers who were liberated by U.S. troops early in 1945 after three years' internment

BRITISH EVACUEES arriving in London after the close of the war in 1945. More than 100,000 women and children were being brought back to their homes from the Midlands and north England after a five-year absence. Some of these children saw London for the first time

adopted by the Conference on Problems of War and Peace, contained basic precepts fundamental to family life and to the welfare of children.

**Argentina.**—In Argentina the national bureau of public health was reorganized and its activities extended to the entire country. The reorganized bureau's duties included enforcement of laws for the protection of health; organization of a nationwide system of registration of vital statistics; and measures in the field of maternal and child health. A division of aid to school children was set up in the department of labour and social welfare to administer medical and dental care and a feeding program for school children.

**Brazil.**—In Brazil the service of assistance to minors in the ministry of justice and interior was reorganized, and its functions were expanded to include study of cases referred to it by any juvenile court in the country, medical treatment and rehabilitation measures and supervision of public and private institutions for dependent children. A decree of 1945 ordered the establishment of a national nutrition commission in Brazil to study the eating habits of the people and to promote dietary improvements.

**Canada.**—Canadian children under 16 became entitled to receive a monthly allowance payable to either parent, under the Canadian Family Allowances act of Aug. 1944, effective July 1, 1945. About 3,500,000 children were estimated to be eligible. Rationing of meat was resumed in Sept. 1945 in order to release as much as possible for shipment to Europe.

**Mexico.**—A campaign on behalf of malnourished children was begun in Mexico under the leadership of the federal bureau of child health and welfare. Plans were made to establish clinics for malnourished children from low-income families. The first Mexican institution for tuberculous children was opened in Mexico City.

**Peru.**—The first of a proposed series of maternal and child-health stations in rural districts of Peru was opened in the town of Tingo Maria with a graduate child-health worker, a midwife and two assistants.

**United States.**—*Special Wartime Programs for Children.*—The children's bureau program of emergency maternity and infant care for wives and infants of men in the four lowest pay grades of the armed forces and of aviation cadets continued throughout the year. The total number of cases authorized for care from the time of the first appropriation in March 1943, through Nov. 1945 was more than 1,065,000 (938,000 maternity cases and 127,000 pediatric cases). During the year ended June 30, 1945, the number of cases authorized for care was 484,000. This program was administered by state health departments with funds appropriated by congress to the children's bureau amounting to \$45,000,000 for the year ended June 30, 1945, and \$44,189,500 for the ensuing year.

The nursery schools and child-care centres, financed in part through funds from the Federal Works agency under the Community Facilities (Lanham) act, continued to operate throughout 1945, although their existence was threatened when the Federal Works agency announced in August that all wartime grants under the act must be discontinued as of Oct. 31, 1945. Their existence through Feb. 1946 was assured, however, when in response to requests from individuals, women's groups and organized labour, the president asked congress to allow the Federal Works agency to use sufficient funds to carry them through the emergency period. On June 30, 1945, there were 2,892 of these projects in operation, with an enrolment of more than 107,000 children.

The number of children receiving allowances under the Servicemen's Dependents Allowance act increased throughout the war period, reaching approximately 3,500,000 by June 1945.

Some 140,000 children of men in the armed forces were receiving payments through the Veterans' administration in June 1945 on account of the death of their fathers.

**Social Security Programs.**—The federal and state co-operative programs for children established in 1935 under the Social Security act and administered by the children's bureau of the U.S. department of labour continued in operation, although the volume of services provided during the war period was impaired by the shortages in personnel. The programs included federal grants to the states for maternal and child-health services (title V, part 1), services for crippled children (title V, part 2) and child-welfare services (title V, part 3). Basic services were maintained in every state under all three programs, except that Utah did not participate in

the program of child-welfare services. Payments to state health and welfare agencies from federal funds during the year ended June 30, 1945, were as follows:

Maternal and child-health services.....	\$5,553,000
Services for crippled children.....	3,874,000
Child-welfare services .....	1,366,000

In all cases these funds were supplemented or matched in large part by state and local funds so that the federal grants by no means represented the total amounts spent for the programs.

Under the program of aid to dependent children administered by the Social Security board of the Federal Security agency under title IV of the Social Security act, some 647,000 children received allowances totalling \$12,300,000 in Aug. 1945, with the federal government reimbursing state departments of public welfare for 50% of payments up to \$18 a month for the first child and \$12 for each additional child in a family. Through old-age and survivors insurance benefits (title II of the Social Security act), also administered by the Social Security board, 356,000 children who were survivors of insured persons were receiving monthly payments totalling over \$4,416,000 in Aug. 1945.

**Vital Statistics.**—The bureau of the census reported continued lowering of infant and maternal mortality rates in 1944. The infant mortality rate, based on deaths of infants under 1 year of age, dropped from 40.4 per 1,000 live births in 1943 to 39.8 in 1944. The maternal mortality rate fell from 24.5 per 10,000 live births in 1943 to 22.8 in 1944, establishing the lowest rate on record for the U.S. The live birth rate for 1944 was 20.2 per 1,000 population. This was somewhat below the 1943 rate of 21.5 but was higher than for any year from 1928 to 1941.

**Juvenile Delinquency.**—Indications that state and local efforts to prevent juvenile delinquency and to control community influences detrimental to youth were meeting with some success began to appear. Preliminary reports for 1944 from 225 juvenile courts reporting to the children's bureau showed a decrease of 5% in the number of delinquency cases disposed of. Widespread public concern over the detention of children in jails was apparent and many communities undertook to study the problem and take steps to meet it. The National Probation association began a study of types of detention care and practice in selected communities.

**Adoption and Illegitimacy.**—Disclosure of adoption abuses resulted in increased public interest in adoption procedures and their control. Of special concern were the problems of unsupervised placement of babies by private individuals, sometimes for profit; reports of the birth of babies outside of wedlock to married women whose husbands were serving overseas; placement of children across state and national boundary lines; and the shortage of facilities and unevenness of standards of service for unmarried mothers. Services for Negro mothers and their children were especially inadequate. Adoption petitions were filed for some 50,000 children during 1944 in the country as a whole, according to estimates of the children's bureau based on information submitted by some 26 state welfare departments. Fully half of these children were being adopted by step-parents or other relatives. In more than one-third of the other cases the children were placed through some responsible agency. This left a large group, almost two-thirds of the children who were being adopted by nonrelated persons, in whose placement no authorized agency had a hand—children given away or even sold without proper consideration of parental rights, investigation of the placement or any record being kept of the child's identity.

About 60% of the children being adopted in 1944 were born out of wedlock. Ten states did not include the item of legitimacy on the birth certificates, yet the number of illegitimate births reported to the bureau of the census in an average year was approximately 80,000. There were signs of an increase in the actual number of illegitimate births during the war years, but because of the great increase in the total number of births, the ratio of illegitimate births to total births decreased somewhat. The children's bureau worked with state welfare departments and other agencies to improve standards of care and supervision and prepared for their use materials on adoption laws and procedures and, in collaboration with the Social Security board and the American Red Cross, on services for unmarried mothers and their children.

**Youth Employment.**—Some 3,000,000 boys and girls 14 through 17 years of age were at work in April 1945, according to estimates based

on sample labour-force surveys made by the bureau of the census. This was approximately the same as the number at work in April 1944 and three times as many as the number recorded by the census of 1940. Half were working full time and not attending school, and half were working in addition to attending school. Nearly one-third of the 3,000,000 were under 16 years of age. During the peak of summer employment the number of young workers rose to between 4,000,000 and 5,000,000, as in previous war years. No official records were available of children under 14 who were at work, either during the summer or during the school year.

Illegal employment of children and youth continued to increase, as indicated by reports of child-labour inspections under the child-labour provisions of the Fair Labor Standards act of 1938, administered by the children's bureau of the U.S. department of labour. Violations of the child-labour provisions, which set a minimum age of 16 for employment in establishments producing goods for shipment in interstate or foreign commerce, with limited employment in nonmanufacturing and nonmining occupations permitted for 14- and 15-year-olds outside school hours and employment in occupations found by the chief of the children's bureau to be particularly hazardous for minors prohibited under 18 years, were reported in 3,481 establishments in the year ended June 30, 1945, an increase of 18.5% from 1944. The number of minors found to be illegally employed in the year ended June 30, 1945, was 13,289, an increase of 57.5% from 1944. Industrial injuries to minors increased greatly during the war period in states for which figures were available, and involved illegal employment of children in many cases.

In 1945, as in the two previous years, the children's bureau and the U.S. Office of Education took the lead in sponsoring a back-to-school campaign to encourage school attendance and to persuade high-school students holding summer jobs to return to school in the fall. The drive was supported by other federal agencies, by state agencies and by private national organizations. Early reports indicated that the downward trend in high-school enrolment had been checked and some increases were evident.

Planning for the postwar needs of students and employed and unemployed young people was undertaken by an interagency committee on youth employment and education. Among the subjects under consideration by the committee, of which the chief of the children's bureau was chairman, were student-aid programs, provision for educational and work opportunities, placement services and guidance and counselling.

**Building the Future.**—Next steps for children and youth in the U.S. during the postwar period were outlined by the National Commission on Children in Wartime, appointed by the chief of the children's bureau, in a report, *Building the Future for Children and Youth*, issued in April 1945. This report was based on recommendations of the children's bureau advisory committees on maternal and child health, on social services for children and on the protection of young workers; and on a statement on the co-ordination of mental-hygiene programs for children and youth issued by a joint committee representing professional societies in the mental-hygiene field. It called for the extension of federal and state health and welfare programs for children and of social-insurance programs contributing to family support; recommended federal aid for education and state legislation to improve adoption laws and establish a state 16-year minimum age for employment; outlined proposals for state and community planning for children and youth; and recommended immediate intensive study of mental-hygiene programs, guardianship laws and practices, leisure-time services and a program for youth during the reconversion period. Several states appointed commissions with broad responsibilities for planning for children and youth.

International planning for child welfare was included in a conference in May 1945, held at the invitation of the International Labour office. Child-welfare experts from some 11 countries met in Montreal, Canada, to prepare material for discussion at the 27th session of the International Labour conference, which was held in Paris, Oct. 15 to Nov. 5, 1945. The Paris conference affirmed its deep interest in the welfare of children and young persons and adopted a draft resolution presented by a special committee on the protection of children and young workers. This resolution urged the governments, while encouraging individuals and families to fulfil their obligations to the fullest extent, to accept responsibility for assuring the health, welfare and education of all children and young persons and the protection of all youthful workers of either sex, regardless of race, creed, colour or family circumstances, both through national action and through international co-operation. The resolution included recommendations on family income, security, medical care and health services, social services and educational opportunities. It also urged a 16-year minimum age for admission to employment with school attendance required to the same age, strict regulation of hours of employment and prohibition of night work, special protection from hazardous work, requirement of work permits, provision of placement services, vocational guidance and suitable work opportunities and payment of wages commensurate with the work performed. It recognized, however, that in some countries these were objectives that must be approached step by step. **Chile.** A republic fronting on the south Pacific coast of South America for about 2,600 mi., its average width being only 110 mi. Area: 286,396 sq.mi. Pop. (1940 census) 5,023,539; official est., Jan. 1, 1944, 5,237,432; density (1944), 18.29 per sq.mi. Composition of the population is largely European; mestizos are estimated at 15% and Indians at 5%; oriental and Negro elements are negligible. Most of the population lives in the central valley; Santiago province alone has 1,463,441 inhabitants (density per sq.mi., 223.12). The capital is Santiago (1944 pop. est., 952,075). Other important cities, with 1944 pop. ests., are Valparaíso (209,945), Concepción (85,813), Viña del Mar (65,916), Talca (50,464), Antofagasta (49,106), Chillán (42,817), Temuco (42,035), Iquique (38,094), Talcahuano (35,774) and Valdivia (34,496). Chile is a unitary republic with a president popularly elected for a four-year term and a bicameral congress including a senate of 45 members and a chamber of deputies of 147. President in 1945: Juan Antonio Ríos.

**History.**—Debate in the congress in February over Chile's war status led Pres. Ríos to assert Feb. 14, 1945, that Chile recognized a state of belligerency with Japan but not with Germany because "that nation is defeated." He added that Chile had had identity of purpose and action with the United Nations after severance of axis diplomatic relations Jan. 20, 1943, and that a formal war declaration against Japan would follow. Ambassador Marcial Mora on Feb. 14 signed the United Nations pact for Chile at Washington. The senate and the deputies on April 5 and 11, respectively, approved a war declaration, and the president and his cabinet signed it April 11. A wave of sabotage, directed especially against naval and merchant vessels, broke out in March. Four vessels were destroyed or damaged by fire, with a death list of 83 in the most serious case. Serious riots broke out at a Santiago church May 12 at the celebration of a mass for the death of Benito Mussolini. The U.S. and Chile signed an agreement at Washington May 24, 1945, for the establishment of a three-year naval mission, including army, navy and marine officers, to advise the Chilean armed forces. Domestic politics continued disturbed during 1945. Congressional elections, March 4, were immediately followed by a collective cabinet resignation which Pres. Ríos refused to accept. Later figures showed that rightist groups had won 23 senate seats and leftists 22; in the chamber of deputies rightists were indicated to have 71 seats divided as follows: Conservatives 36; Liberals 31; Progressive Liberals 1; Agrarians 3; leftists divided 75 seats as follows: Radicals 38; Communists 18; Socialists 7; Falange 5; Democrats 7; one independent was elected. Pres. Ríos later planned to organize a cabinet including Radicals, Liberals, Democrats and Agrarians but, because of party disagreements, abandoned the plan April 30. A new cabinet sworn in May 14 was composed chiefly of moderate leftists from the Radical, Socialist, Democratic and Chilean Falange parties. When the congress organized, May 22, Senator (and ex-president) Arturo Alessandri was elected president of the senate and Conservative Deputy Juan Antonio Coloma president of the lower house. Chile's worst mine disaster occurred June 19 when fire broke out in the Braden Copper company's great Teniente mine at Sewell in the Andes, with a loss of life of almost 500. The first Pan-American Social Service congress met at Santiago on Sept. 9 with delegates present from 15 nations. Strikes proved troublesome in 1945, three of the worst being a strike in the Iquique region in March, involving about 7,000 nitrate, railway, port and staff

workers; one at Valparaíso beginning Sept. 26 involving long-shoremen protesting the use of Chilean naval personnel for loading coal on a vessel bound for Argentina; and another in which 30,000 nitrate, copper, railway and port workers in the north went out on strike on Oct. 13 over alleged nonfulfilment of arbitration terms in a labour dispute. A trial of Germans accused of espionage activities resulted in conviction of 26 on June 8.

Pres. Ríos visited the U.S. in October and was entertained by Pres. Truman Oct. 11. An important purpose of the visit was allegedly to get U.S. commitments concerning the Chilean copper industry.

**Education and Religion.**—School enrolment in 1943 was reported to be 576,900 in 5,364 primary schools, 87,265 in 418 intermediate schools and 6,402 in five universities. The literacy rate in 1943 was estimated at 76%, third highest of all Latin American states.

Roman Catholicism is the dominant religion although church and state were separated following the adoption of the 1925 constitution. Pope Pius XII on Dec. 23 elevated José Caro Rodríguez, archbishop of Santiago, to the rank of cardinal; it was the first occasion that Chile had had a dignitary of that rank.

**Finance.**—The monetary unit is the peso, valued in Dec. 1945 at 3.04 to 5.16 cents (U.S.). Preliminary 1946 budget figures estimated expenditures at 5,192,000,000 pesos and revenues at 4,882,000,000 pesos; the deficit was to be met by increases in postal and telegraph rates and retention of recent presumably temporary increases in income and other taxes. Estimate of expenditures for 1946 was later increased to 5,825,000,000, most of the additional sum being pledged to salary increases for government workers and teachers. The budget for 1945 totalled 4,749,036,000 pesos (1944: 3,787,994,000). Chief revenues in 1945 included: national property, 53,521,000 (1944: 50,405,000); national services, 267,001,000 (1944: 230,962,000); direct and indirect taxes, 3,426,511,000 (1944: 2,938,636,000); miscellaneous income, 1,002,005,000 (1944: 567,992,000). Important expenditures in 1945 were: office of the president, 3,844,000 (1944: 3,417,000); national congress, 27,529,000 (1944: 27,289,000); interior, 731,520,000 (1944: 592,169,000); foreign relations, 41,734,000 (1944: 40,898,000); finance, 688,494,000 (1944: 565,369,000); public education, 776,350,000 (1944: 515,430,000); justice, 137,759,000 (1944: 134,488,000); war, 690,048,000 (1944: 528,637,000); navy, 439,042,000 (1944: 436,706,000); aviation, 126,019,000 (1944: 123,685,000); public works and highways, 507,452,000 (1944: 298,619,000); public health and social security, 398,940,000 (1944: 341,048,000). Expenditures for public works reflected a large increase in 1945 and it was anticipated that they would continue to be large for some years to come because of the approval early in 1945 of a 3,000,000,000 peso six-year plan of public works; major items of such expenditure were to be irrigation and land development, highways and bridges, railway construction and improvements, ports, sewage systems, drinking water and conservation development and the University of Chile. A portion of the funds required was to be derived from 75% of the extraordinary copper tax (estimated at 400,000,000 pesos) and 200,000,000 pesos from the sale of 7% bonds. Deficit financing continued to be a serious problem; the accumulated budget deficit at the beginning of 1945 was 562,000,000 pesos, excluding the overdraft under special extra-budgetary laws.

**Trade and Communications.**—An export balance usually prevails. Exports in 1944 were valued at \$197,746,000 and imports at \$149,092,000. The principal exports are copper, nitrate and iodine, wool, hemp, legumes, rice and sheep skins; the U.S. in 1944 took 64% by value of all Chilean exports, Argentina

8%, Brazil 4%, Peru 2% and Great Britain 1%. Principal imports are textiles, chemicals, machinery and mineral, agricultural and metallurgical products; the U.S. in 1944 provided 43% by value of Chilean imports, Argentina 17%, Peru 17%, Brazil 10% and Great Britain 6%. The government on Feb. 6 announced a three months' extension of the minerals purchase contract by the United Commercial company. Late in July 1945, Chile and the U.S. announced conclusion of a trade agreement by which Chile granted unilateral concessions for one year on a long list of tariff items, chiefly in the textile, clothing, chemical and metallurgical fields. The action virtually restored benefits which the U.S. formerly enjoyed on a most-favoured-nation basis until the cancellation of a Franco-Chilean agreement. Chile expressed the hope that its concessions might lead to a treaty of friendship, commerce and navigation. Imports in the first half of 1945 totalled 415,587,369 gold pesos in value (an increase of 37,269,676 more than the same period in 1944) and exports in the same period were valued at 603,538,344 gold pesos (a gain of 66,826,406 pesos from the first half of 1944).

Highway mileage totals 28,125 and includes 2,118 mi. of macadam or otherwise hard-surfaced roads, 7,459 mi. of gravel and 1,445 mi. of improved earth roads. Railway mileage is 5,407, most of it in two major systems, the Ferrocarriles del Estado (state railways) and the Antofagasta and Bolivia Railway Co. Chile has 92 airports to serve three major aviation lines. The Chilean section of the Antofagasta-Salta (Argentina) railway was expected to be completed in 1945. The state railways anticipated a deficit of about 130,000,000 pesos in 1946.

Transportation facilities in general were heavily overtaxed in 1945.

**Production.**—Coal production in 1944 was estimated at 2,508,515 short tons, the highest output in 20 years. Wine production in 1944 was 82,951,772 gal., the highest figure from 1938. Iron ore production in 1944 was 19,475 short tons as against 1943 production of 5,111 short tons and a normal production of about 1,653,450 tons. Rough rice production in 1944-45 was estimated at 165,772,526 lb. and milled rice at 102,779,017 lb. Wool production in 1944-45 was estimated at 17,085 short tons. Fruit crops in 1944-45 were estimated at 600,000 boxes of 46 lb. Other agricultural production estimates for 1944-45 (in short tons) were: wheat 988,842; beans 84,759; lentils 15,327; potatoes 522,667; sunflower seed 31,946; hemp 6,628; oats 133,656; barley 86,238.

**FILMS.**—*Chile* (Encyclopædia Britannica Films Inc.). (R. H. FN.)

**China.** A republic of Asia. With the recognition of the independence of Outer Mongolia and the restoration of Taiwan (Formosa) and Manchuria (in 1945, 9 provinces, previously 3) China has 34 provinces and two special areas, Tibet and Taiwan, totalling about 3,858,900 sq.mi. According to the ministry of interior, the estimated population of China in March 1945 was 454,928,000, excluding more than 6,000,000 in Taiwan. The estimated population of the leading cities in March 1945 was: Nanking, 1,019,148; Shanghai, 3,726,757; Peiping, 1,550,561; Tientsin, 1,217,646; Chungking, 1,037,630; Canton, 1,115,000.

Capital: Nanking; President (1945): Chiang Kai-shek.

**History.**—The Chinese people, who withstood more than eight years of hardship and privation in resisting aggression, were jubilant over Japan's acceptance of the Potsdam surrender terms on Aug. 14, 1945. But their jubilation and longing for peace were soon shattered when the communists demanded the right to accept the surrender of the Japanese in China, and, subsequently, the government and communist troops raced to control the important centres in north China and Manchuria.

Left: JAPANESE SURRENDER of about 1,000,000 troops in China took place at Nanking on Sept. 9, 1945 (Chinese time). Gen. Yasuji Okamura, seen stamping the document, signed for Japan; Gen. Ho Ying-chin accepted for the Chinese government

Right: CHINESE COMMUNISTS avenged destruction of this and other villages in China's border region by united guerrilla action against the Japanese in 1945

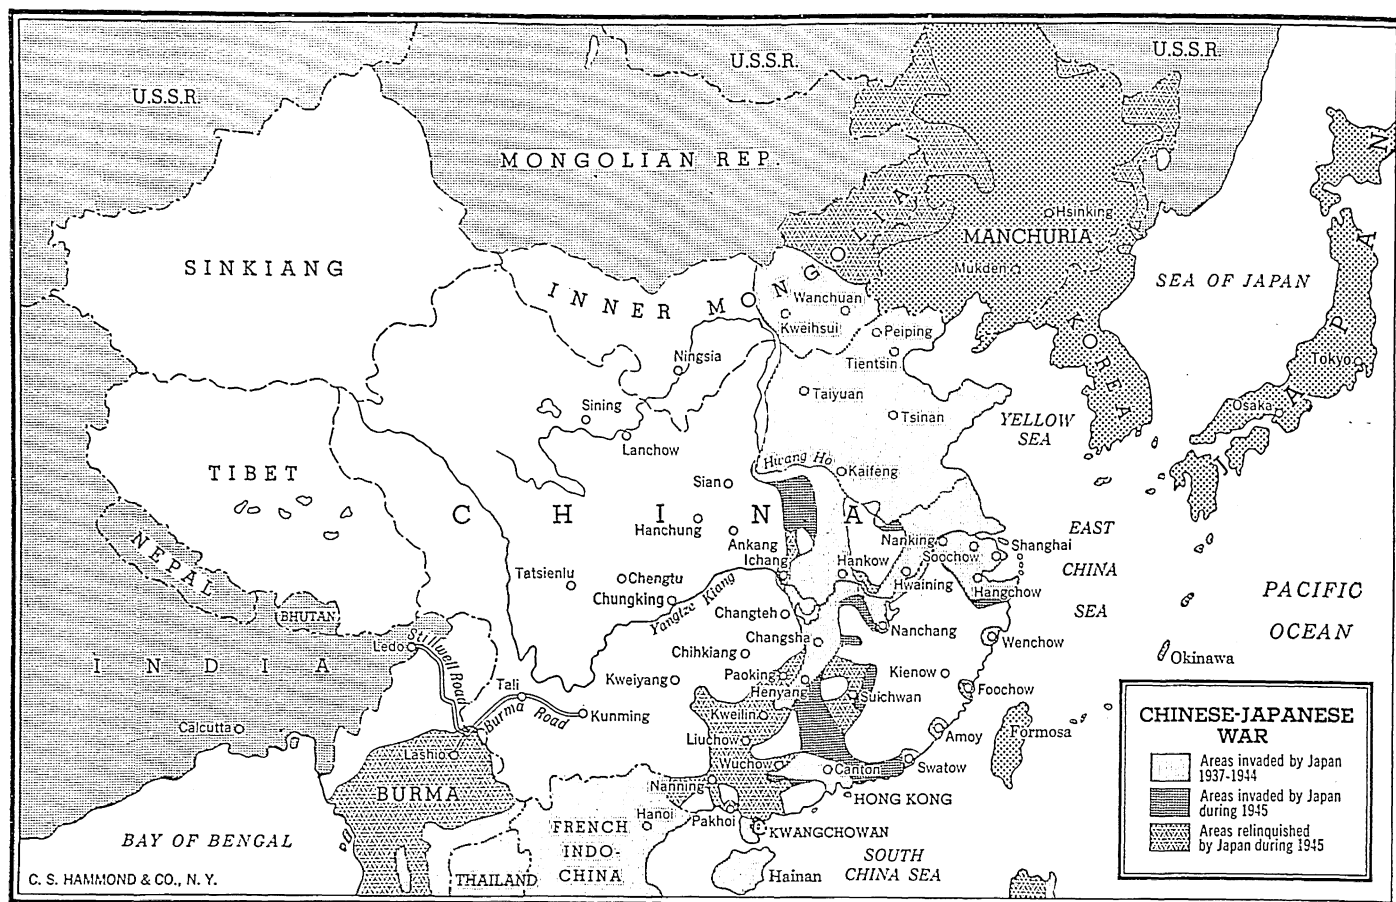

Above: REPATRIATED from China in 1945, these Japanese civilians, mainly war widows and children, are shown in their quarters below deck on a small merchant ship, which is carrying them from Shanghai to Japan

Right: CROWDS in Kunming, China, watch the first truck convoy over the new Stilwell road roll by. The convoy reached China on Jan. 28, 1945

The defeat of Japan and the threat of open civil war overshadowed all other developments in China in 1945.

Early in the year improvements in Chinese fighting strength and morale were evident. On the Burma front the Chinese succeeded in forcing the enemy to retreat from the Yunnan-Burma border area and in reopening a land supply route. In the China theatre the Chinese, counterattacking with U.S. air assistance, forced the Japanese into a strategic retreat in May. Before Japan surrendered, China had recovered Foochow, Nanking, Wenchow, Liuchow and Kweilin. It was agreed that all the Japanese forces within China (excluding Manchuria), Formosa and northern Indo-China should surrender to Generalissimo Chiang Kai-shek. Hong Kong, which was assigned to the China theatre after Pearl Harbor, was surrendered to Great Britain but on Aug. 24 Chiang expressed the hope of a rational settlement of the Hong Kong question through legal processes. The signing of the surrender document in Nanking on Sept. 9 officially ended the Sino-Japanese war, which cost China more than 3,500,000 military casualties plus many millions of civilians.

The important political developments were: (1) the decision of the sixth Kuomintang congress (May 5-21) to terminate the period of political tutelage by setting the date for the People's congress (national assembly) for Nov. 12, 1945; (2) the resolutions adopted by first session of the fourth People's Political council in July urging the government to achieve national unity by political means, to bring about democratic reforms and to ensure civil liberties; (3) the appointment on May 31 of T. V. Soong and Wong Wen-hao to succeed Chiang Kai-shek and H. H. Kung as president and vice-president of the executive yuan respectively, and the appointment on July 30 of Wang Shih-chieh to succeed T. V. Soong as minister of foreign affairs. The fundamental political problem was the relationship between the government and the communists which assumed military and diplomatic importance.

China was well established within the United Nations. It was

one of the inviting powers of the Conference on United Nations organization and played a conciliatory but important role at San Francisco from April 25-June 26. China completed the work of abolishing the unequal treaties by signing new treaties with Sweden and the Netherlands in April and May. On Aug. 18 France signed the Sino-French convention on the rendition of the leased territory of Kwangchow-wan. Perhaps the most important diplomatic developments were the signing of the Sino-Soviet treaty of friendship and alliance on Aug. 14 (ratified on Aug. 24), and the issuance of President Truman's statement on U.S. policy toward China on Dec. 15 following Maj. Gen. Patrick J. Hurley's dramatic resignation and the immediate appointment of General George C. Marshall as his successor. The important provisions of the Sino-Soviet treaty were: (1) China's recognition of the independence of Outer Mongolia; (2) Sino-Soviet joint ownership and administration of the main railways in Manchuria for 30 years; (3) for 30 years Port Arthur to be a Sino-Soviet joint naval base and Dairen to be a free port; (4) Russia to withdraw its troops from Manchuria, to keep its hands off Sinkiang and to render moral and military support to the national government. Truman's statement declared that the cessation of civil war, broadening of the legitimate national government and elimination of the communist army were essential to achieve a strong, united and democratic China. These two documents had an important bearing on the government-communist relationship.

The perennial government-communist negotiations were resumed after President Chiang's three urgent invitations, Aug. 16-25, to Mao Tse-tung, the communist leader, to come to Chungking to discuss problems of national unity and reconstruction. On Aug. 28, two days after the Sino-Soviet treaty was made public, Mao accompanied by former U.S. Ambassador Hurley arrived in Chungking. On Oct. 10 they reached an agreement in principle to work for a united and democratic China and to form a Political Consultative council and a Mil-

tary committee to solve the fundamental military and political problems upon which they failed to agree. Before these two bodies could meet, serious fighting between government and communist troops broke out anew. However, with Russian consent and U.S. assistance in landing government troops in Manchuria and with the arrival of General Marshall in China and of the communist delegates to the Political Consultative Council in Chungking in late December, the prospect of achieving China's unity again looked bright.

**Education.**—During the eight years of war with Japan there was a steady quantitative increase of higher and secondary institutions. Excluding schools in former occupied areas, there were in July 1945, 145 institutions of higher learning with an enrolment of 73,667; 3,455 secondary schools with an enrolment of 1,101,087; and 265,417 primary schools with about 18,000,000 pupils. The immediate task in education was to move many of the higher and secondary schools back to their original campuses and to reorganize and re-establish the schools in the former occupied areas.

**Defense.**—Before the reorganization of the army in the spring of 1945, China maintained a nominal strength of more than 300 divisions totalling 5,000,000 men. The reorganization program brought better treatment, pay, rations and medical service to the troops, and disbanded more than 100 divisions totalling 1,700,000 officers and men. About 39 of the 200 divisions were modernized and equipped with U.S. weapons. The communist independent army was estimated at more than 1,000,000. In 1945 China had 16 gunboats of more than 7,000 tons plus 10 very small war vessels taken over from the Japanese.

**Finance.**—The exchange rate ranged from the official Chinese \$20 to U.S. \$1 to an official Ch. \$500 to U.S. \$1 with government subsidies added to the official rate, but the black market rate reached the peak of Ch. \$3,000 to U.S. \$1 in July 1945. In June the price of basic goods such as food and clothing was almost 1,000 times that of June 1937. The volume of note issuance in Free China alone was estimated at Ch. \$400,000,000,000. The 1945 budget was estimated at about Ch. \$200,000,000,000, 190 times larger than that of the year 1937, and the actual expenditures were even greater. Only about 45% of the budget could be met by taxation. From 1938 to Aug. 1945, Russia, the United States and Britain extended loans to China totalling £58,047,000 and \$870,000,000. Up to May 31, 1945, China received U.S. lend-lease materials valued at \$362,000,000.

In June 1945, excluding the banks in former occupied areas, the government, local and private banks numbered 587 (2,531 branch offices) with a total capital of Ch. \$2,388,204,500 and paid-up capital of Ch. \$2,123,949,364.

**Trade and Communication.**—Excluding goods exchanged under barter arrangements, China's total imports and exports in 1944 amounted to Ch. \$3,494,918,980 and Ch. \$789,907,846 respectively.

In 1931 China had more than 10,000 mi. of railways, most of which were in Manchuria and North China. In June 1945 Free China had only about 770 mi., more than two-thirds of which were built after 1937. Before July 1937 China had about 72,000 mi. of highways. During World War II more than 8,000 mi. were built, and in June 1945 Free China had about 52,100 mi. of highways with only about 4,000 motor vehicles. China's telecommunications and civil aviation remain insignificant in proportion to its population.

**Agriculture, Manufactures, Mineral Production.**—China does not produce enough food for its population. The estimated yearly production of important crops during 1931-37 in China (excluding Manchuria) was about 2,900,000,000 piculs (1 picul=133½ lb.). Based on the 1931-37 average production in 15 Free China provinces, the crop production in the same area

showed slight change during the war while livestock production registered a sharp decrease. In Free China industrial production of producer's and consumer's goods showed a definite drop in 1944 and 1945. In 1936, excluding Manchuria, China's chief mineral production approximately was: coal, more than 15,000,000 tons; pig iron, 155,640 tons; steel, 50,000 tons. In 1943, Free China's mineral production in short tons was as follows: coal, 6,868,034; pig iron, 35,072; steel, 9,974; refined tungsten, 9,926; refined tin, 4,648; refined antimony, 480. **Christian X** (1870- ), king of Denmark, of whom a biographical account will be found in *Encyclopædia Britannica*. Nephew of Queen Alexandra of Great Britain, he succeeded his father, Frederick VIII, in 1912. King Christian became increasingly popular with the passing years and kept in close contact with his people.

From the invasion in 1940 until the popular uprising against the Germans in Aug. 1943, King Christian had maintained an autonomous Danish administration; from Aug. 1943, until the liberation in 1945, the king was a virtual prisoner in his own castles at Sorgenfri or Amalienborg. It was therefore quite natural that much of the national enthusiasm on freedom from the German yoke expressed itself in demonstrations at Amalienborg. On the king's 75th birthday, Sept. 26, 1945, Copenhagen was bedecked with flags, flowers and pictures, and royal relatives came from Norway and Sweden to honour the popular monarch of the Danes. (See also DENMARK.) (F. D. S.)

**Christian Science.** The religion founded by Mary Baker Eddy and represented by the Church of Christ, Scientist, which was organized at Boston, Mass., in 1879. The textbook of this religion, *Science and Health with Key to the Scriptures*, written by Mrs. Eddy, was published in 1875.

From the beginning of World War II, the Christian Science Church, through its Camp Welfare Committee, supervised the activities of its more than 1,000 Christian Science Wartime Ministers and volunteer workers, whose duty it was to minister to the spiritual and material needs of the men and women in the armed forces at home and abroad. Christian Science services were also conducted by these Wartime Ministers and workers wherever possible. Although of civilian status, they served with the approval of and in co-operation with army and navy chaplains and commanding officers, and were always on duty to respond to requests for Christian Science healing and help.

In 1945, there were 25 chaplains in the United States army and one in the navy. Four of these chaplains received bronze stars for meritorious service.

The literature published by The Christian Science Publishing Society, which includes *The Christian Science Journal*, a monthly publication listing Christian Science churches and societies, was available at all Reading Rooms maintained by the churches, as well as at all rest rooms and recreational centres provided for

servicemen and servicewomen.

A Christian Science War Relief Committee co-operated with other relief groups in the United States and Canada in supplying money and clothing to sufferers in the British Isles, Europe and Russia, without regard to race, colour, or creed. There were 970,000 garments shipped to continental Europe alone. This did not include the thousands of pieces of knitted garments supplied to men and women in the armed forces of the United States and its allies. With the end of the war in Europe, a Christian Science Postwar Relief Committee was formed.

Transcribed radio programs prepared in The Mother Church, The First Church of Christ, Scientist, in Boston, Mass., were broadcast over more than 100 stations throughout the United States and Canada. The Mother Church also continued its periodic broadcasts of Sunday "Columbia Church of the Air" programs over the Columbia Broadcasting System.

*The Christian Science Monitor*, an international daily newspaper, published by The Christian Science Publishing Society, maintained its usual large staff of correspondents throughout the world, including correspondents in all theatres of war. *The Monitor* received a fire-prevention award of a \$500 gold medal for outstanding service in the field of fire prevention. It also received the Helms Athletic Foundation award in recognition of noteworthy achievement in the realm of sports. It won First Honorable Mention in the over-50,000 circulation group in the Annual Exhibition of Newspaper Typography conducted by N. W. Ayer and Son, Inc. (W. D. K.)

**Christian Unity.** One of the chief devices counted on to advance Christian unity was a series of international commissions set up by the world conferences at Oxford and Edinburgh in 1937. Though British, American and Swedish study groups were at work, World War II largely prevented the capacity functioning of these commissions. With the end of the war a beginning was made in reconstituting them on a world scale so that a continuous endeavour to secure a meeting of minds on the major points of difference and difficulty was expected to go forward.

On the organizational side the necessary assemblies to complete the setting up of the World Council of Churches were similarly in progress. With the end of the war numerous preliminary committees met looking to a formal meeting of the Council's Provisional committee early in 1946. The broken threads of personal contact were promptly picked up and important deputations went back and forth between major denominations and representatives of the World Council, especially in countries inaccessible during the hostilities. Dr. S. M. Cavert, general secretary of the Federal Council of Churches of Christ in America, was loaned to the World Council headquarters in Geneva, Switzerland, for a period of six months as a contribution of the American Church to the reconstructive process.

The appalling need of European populations beyond the relief measures undertaken by governments and the U.N.R.R.A. diverted much of the concern and activity of the World Council to supplying the immediate physical needs of individuals and families. Beyond this a major department of reconstruction and interchurch committee set up long-term strategic plans for the institutional reconstruction of war-wrecked European churches and for aiding them in reopening the scenes of normal activities. John D. Rockefeller, Jr. contributed \$1,000,000 for this purpose. Ninety churches in 31 countries definitely accepted membership in the World Council.

Formal integration of churches on a national scale followed in the wake of war changes. The German Church was formally reorganized on Aug. 28, 1945, by an assembly of 100 representatives, including Lutheran, Reformed and United Church bodies,

under the name, Council of the Evangelical Churches in Germany. The organization was described as "going beyond federation but stopping short of amalgamation." Important deputations made contact with the Christian churches in Japan. Without effecting specific ecclesiastical organization, which had to wait on further development of the Japanese situation, they reported the expectation that the enforced unity of most of the Protestant bodies in Japan under totalitarian pressure would be voluntarily continued in a united Japanese Christian Church.

The latest directories of interchurch federations and councils in the United States showed 35 states in 1945 maintaining inclusive types of interdenominational organization which attempted to combine all aspects of the co-operative work of the churches under a single agency. Only seven states were left maintaining narrower forms of co-operation and only a single state with no form of state-wide Protestant co-operative agency. Counting state and local organizations, a total of 535 councils of churches or similar bodies were catalogued in 1945.

The proposal for a federal union of the churches through the adoption of a common name and greatly augmented unity measures continued to be pushed by the distinguished evangelist, Dr. E. Stanley Jones. A nation-wide organization was set up to undertake systematic campaigns in behalf of this movement.

New negotiations for the union particularly of denominations were undertaken between the United Presbyterian and the Reformed Church in America during 1945. The union of the United Brethren and the Evangelical Churches progressed to a point which indicated its early consummation. Negotiations between the Congregational Christian and Evangelical and Reformed denominations continued, a joint session of their national bodies being called for 1946. Discussions of the union of the Presbyterian Churches of the U.S. and the Presbyterian Churches of the U.S.A. were continued but no further action occurred in 1945. The inaugural address of Dr. Henry Pitney Van Dusen, president of Union Theological seminary of New York city, dealt extensively with reunion and revival. Under current world conditions Dr. Van Dusen urged a revival of religion which can take place only in connection with the reunion of the churches whose division makes them inadequate as instruments of religion in a world which desperately needs to be united on the basis of Christian outlooks and convictions.

(H. P. D.)

**Chromite.** Data for 1944 were scarce at the close of 1945 but world production for the remaining war years is shown in Table I.

Table I.—World Production of Chromite  
(Thousands of short tons)

	1940	1941	1942	1943	1944
Cuba . . . . .	57.7	179.9	315.8	390.4	211.8
Greece . . . . .	36.5	?	44	16	?
India . . . . .	62.2	56.1	55.6	37.3	?
New Caledonia . . . . .	61.5	52.4	78.4	55	?
Philippines . . . . .	214.3	330	55	66	?
South Africa . . . . .	180.4	156.4	372.1	179.9	?
Southern Rhodesia . . . . .	308.4	345.4	383.7	293.5	?
Turkey . . . . .	187.2	165.7	159.5	216.9	165
U.S.S.R. . . . .	?	?	440	358	?
United States . . . . .	3.0	14.3	112.9	160.1	45.6
Yugoslavia . . . . .	78.3	?	110	72	?
Total . . . . .	1,616	1,990	2,180	1,992	?

Note.—Figures without a decimal are estimates.

**United States.**—The trend of supply and demand of chromite during World Wars I and II may be compared as shown in Table II.

In addition to revealing the extent to which the U.S. was dependent on foreign sources of supply, these figures emphasize the increased demands that resulted from technological developments during the interwar period. The tonnage record of output in 1939-44 was materially higher than in 1914-19, but

Table II.—Chromite Data for the United States for the periods of World Wars I and II

(In thousands of short tons)							
	Pro-duction	Im-ports	Sup-ply	Pro-duction	Im-ports	Sup-ply	Con-sumption
1914	0.7	83.7	84.4	1939	3.9	355.6	359.9
1915	3.7	85.7	89.4	1940	3.0	736.6	739.6
1916	52.6	129.9	182.5	1941	14.3	1,115.3	1,129.6
1917	49.0	80.9	129.9	1942	112.9	981.6	1,094.5
1918	92.4	112.2	204.6	1943	160.1	928.6	1,088.7
1919	5.7	68.9	74.6	1944	45.6	848.4	894.0

as compared with the existing demand the relative showing was much poorer. Furthermore, much of the 1939-44 output was too low in grade to be salable even under war demand, and remained at the close of 1945 in stock piles.

It was twice demonstrated that only under war demand could the domestic reserves yield an appreciable output, and at best only a fraction of the total required. The availability of foreign supplies is therefore a matter of prime importance. Imports from the chief sources of supply are shown in Table III.

Table III.—Imports of Chromite into the United States (Thousands of short tons)

	1940	1941	1942	1943	1944
Cuba . . . . .	58.2	179.9	137.8	310.7	349.1
Greece . . . . .	15.7	2.2	...	...	...
U.S.S.R. . . . .	...	...	30.1	99.9	112.3
India . . . . .	36.6	10.9	21.3	2.8	...
Philippines . . . . .	175.4	288.4	30.5	...	...
Turkey . . . . .	78.5	61.8	119.5	90.8	98.8
South Africa . . . . .	126.3	189.7	262.3	111.6	40.4
Southern Rhodesia . . . . .	177.9	269.2	277.3	243.5	187.8
New Caledonia . . . . .	48.0	90.2	82.7	32.5	34.5
Total . . . . .	736.6	1,115.3	981.6	928.6	848.4

These figures show the shifts that were made from one source of supply to another as shipping conditions or the progress of the war affected various producers. It was evident that without the Cuban supply close at hand, the chromite supply problem would have been much more difficult.

(G. A. Ro.)

**Chronology:** see CALENDAR OF EVENTS, 1945, pages I-16.  
**Churches, World Council of:** see CHRISTIAN UNITY.

**Churchill, Winston Leonard Spencer** (1874- ), British statesman, was born at Blenheim palace, Oxfordshire, England, on Nov. 30, the elder son of Lord Randolph Churchill and Jennie, daughter of Leonard Jerome of New York city. For his biography and his political career during World War I, see *Encyclopedia Britannica*.

The outbreak of war on Sept. 3, 1939, was the occasion for Churchill's re-entry into the cabinet in his old office of first lord of the admiralty. On May 10, 1940, when the German drive on France began, Chamberlain resigned and Churchill became prime minister. Churchill emerged as a fighting leader and on June 4, 1940, after the evacuation of Dunkirk, he promised that Britain would fight on alone "whatever the cost may be."

Under Churchill's guidance, England, which in 1940 stood alone as the last defense in the west against the armed might of the nazis, was converted into a powerful military and air base, from which Allied armies launched their invasion of western Europe in 1944. Despite Allied military successes in 1944, however, Churchill, for the first time in his four years as Britain's wartime prime minister, faced serious opposition at home and abroad during the year. Dissatisfaction with his support of Premier Hubert Pierlot in Belgium and his refusal to accept Count Carlo Sforza as either premier or foreign minister in Italy came to a head in December when he threw the support of British troops in Greece against the National Liberation Front or E.A.M. when civil war broke out in that country.

"DROPPING THE PILOT." Winston Churchill, British prime minister during World War II, resigned in July 1945 when the Conservative party was defeated in the general election. Cartoon is by Bishop of the *St. Louis Star Times*

During 1944 Churchill participated in two conferences with leaders of the other United Nations. In September he travelled to Quebec where he and President Roosevelt discussed the strategy for the conclusion of the war in Europe and for the destruction of the Japanese.

In October Churchill met with Premier Stalin in Moscow, where the two leaders discussed the policy to be adopted in the Balkan countries and the bringing together of the two factions of the Polish government.

At the beginning of 1945 Churchill attended the Yalta conference (Feb. 4-11) where he, Roosevelt and Stalin mapped the final plans for defeat of the reich and for its postwar treatment. He then conferred with Pres. Roosevelt at Malta, where the two Allied leaders discussed plans for expediting the war against Japan. This was his last meeting with the president, who died April 12. In a eulogy delivered at St. Paul's cathedral, April 17, Churchill described Roosevelt as the "greatest champion of freedom who has ever brought help and comfort from the new world to the old."

Following the defeat of the reich, the Labour party broke away from the coalition government, rejecting Churchill's invitation to remain in the cabinet until the war with Japan was over. Churchill consequently reformed his cabinet, May 25, without the Labour members and then led the Conservative electoral campaign. He exhorted the British electorate to abjure "these socialist dreamers to their utopias or nightmares," but the Labourites scored a huge political upset, winning the elections (July 26). Churchill, who was attending the Berlin conference with Premier Stalin and Pres. Truman when the vote results were tabulated, relinquished his parley seat to his successor, Prime Minister Clement Attlee, and became leader of his majesty's opposition.

**Church Membership.** The following figures are taken from the *Yearbook of American Churches*, compiled under the auspices of the Federal Council of the Churches of Christ in America, published in July 1945. The "inclusive membership" column gives the official records of the church bodies. The "13 years or over" column is given for

use in comparisons and discussions of the relative numerical standing of the churches reported.

Church Membership in the United States in 1944\*

Body	Churches	Inclusive membership	13 years or over
Adventists, Seventh Day . . . . .	2,531	194,832	194,832

Totals . . . . .	253,762	72,492,669	59,717,181

\*Continental United States only.

The total reported church membership in 1944 was 72,494,669, which is 52.5% of the estimated population. All figures are for the continental United States only. This is the largest total church membership and the highest proportion of church membership in the total population ever reported. The total number of local churches was 253,762, also the largest number ever reported.

Fifty-five religious bodies had 50,000 or more members each, and 97.4% of the church members of the U.S. belonged to these bodies. The remaining 2.6% were in 201 smaller bodies. Of the total reported church membership 32.3% was Roman Catholic; 1.3% Old Catholic, Polish Catholic and Eastern Orthodox; 6.4% Jewish; and 60% Protestant. (L. A. WE.)

**Church of England.** The outstanding religious event of 1945 was undoubtedly the publication on June 19 of *Towards the Conversion of England*, the final report of the archbishops' commission on evangelism, with its penetrating analysis of the spiritual and psychological needs of

THE NEW ARCHBISHOP of Canterbury and Primate of all England, Dr. Geoffrey Francis Fisher, wearing mitre, proceeding to Canterbury cathedral for enthronement, April 19, 1945

the age, its emphasis on the limitations of merely scientific education and on the need for evangelism by trained laymen, and its advocacy of the use of modern agencies of propaganda, including the cinema, drama, radio, television, the press, literature, Christian information and publicity centres and advertising.

It was the second of two years of great reports which had embodied the results of enquiries undertaken during World War II and had laid the foundations for the church's efforts in the ensuing decade. Recommendations made included: the establishment of a central treasury for the church; a minimum of £500 a year for incumbents; £1,000,000 over ten years for the church training colleges for teachers; a central theological college for women; and various developments of youth work.

Apart from the solemn observances of V-E day and V-J day, and from the extensive efforts to provide a fitting welcome back to their parishes for men and women of British forces on demobilization, the events of the year included the enthronement on April 19 of Dr. G. F. Fisher as archbishop of Canterbury and primate of all England, and on Oct. 9 of Dr. J. W. C. Wand as bishop of London; a decision to raise £250,000 for Christian reconstruction in Europe; and the issue by the archbishops of Canterbury and York on Oct. 10 of an appeal for £100,000 as a free gift to the Chung Hua Sheng Kung Hui, the Anglican daughter-church in China, which had sent a unique appeal for help to the Church of England. An intensive campaign was conducted to recruit missionaries, including teachers, doctors, nurses, radiologists and other technicians, for the church overseas. Notable pronouncements by the new primate during the year issued a challenge to the church in connection with education; clarified many misunderstandings of the position of the Church of England in relation to the proposed United Church in south India; and dealt with the future of Germany and the use of the atomic bomb. (Ro. Sro.)

**Civil Aeronautics Administration.** In its contributions toward resumption and intensification of civil aviation activity in 1945, the Civil Aeronautics administration emphasized the development of personal flying on a mass scale. Assistants for personal flying development were named in six of the nine regions of the CAA and in Washington, D.C., and an industry advisory committee on nonscheduled flying was appointed and met regularly.

To simplify the process of becoming a private pilot, the CAA authorized physical examination by any registered doctor, dropping the previous restriction to designated examiners. The CAA co-operated with the Civil Aeronautics board in formulating new, condensed requirements for the private pilot written examination.

Also aimed at aiding private flying was the CAA air-marking program. Communities were stimulated and guided in applying uniform methods of marking so that they can be recognized from the air.

Assistance was given to state and local governments and private interests in developing plans for airports in line with the CAA national goal of doubling the number of fields existing in 1945 to a total of 6,300.

Thousands of discharged army and navy airmen turned to the CAA for guidance in entering civil aviation. Even before leaving the service, military pilots were given CAA certificates at a rate in excess of 1,000 a week.

Continued replenishment of the reservoir of aviation interest was assured as thousands of elementary and high schools established on a permanent peacetime basis the aviation courses and materials introduced during World War II. CAA technical guidance was furnished through the state school systems, several of which set in motion "flight experience" programs, under which high school students receive about four hours of instruction in the air.

CAA technicians completed the testing of surplus military transports for use on overseas hops by civil air lines, and conducted numerous proving runs to assure safety on newly authorized transoceanic routes.

Working through the Provisional International Civil Aviation organization, the international aviation body at Montreal, Can., and by direct conversations with representatives of foreign governments, progress was made toward establishing world-wide airways facilities of a uniformly high standard.

Technical advances by CAA included a new approach-control system which permits landings every three minutes in "instrument weather"; agreement with the air lines to install direction-finding equipment at key airports for bad-weather landings during the winter of 1945, pending completion of the very high frequency radio ranges and instrument (blind) landing systems perfected by CAA; and experimentation with military radar for civil use. (See also AIRPORTS AND FLYING FIELDS; AVIATION, CIVIL.) (T. P. W.)

**Civilian Defense.** **United States.**—The national Office of Civilian Defense was terminated by executive order of President Truman at the end of the fiscal year, June 30, 1945. It was one of the first of the World War II agencies to be discontinued.

It had been established within the Office of Emergency Management by executive order 8757 of May 20, 1941, and amended by later executive orders.

Its purpose was to assure effective co-ordination of federal relations with state and local governments engaged in the fur-

therance of war programs; to provide for necessary co-operation with state and local governments with respect to measures for adequate protection of the civilian population in war emergencies; and to facilitate participation by all persons in war programs. There were state defense councils responsible for 11,400 local defense councils which enrolled approximately 11,000,000 volunteers.

The agency carried out its functions through four operating divisions: federal-state co-operation, protection services, protective property and industrial protection.

**Division of Federal-State Co-operation.**—Through state defense councils, the division aided and encouraged community organization for civilian war services, but the several federal agencies retained full responsibility for providing technical advice and guidance in their respective states. Most usual were programs of health, housing, manpower, recreation, welfare and child care, agriculture, consumer interests, nutrition, salvage, transportation and war savings. Volunteers serving in civilian war services programs were members of the United States Citizens Service corps. Boys and girls under 16 years of age volunteering their services under the supervision of adult group leaders were enrolled in the Junior Citizens Service corps.

**Protection Services Division.**—This division developed comprehensive programs for training and organizing volunteers to safeguard the civilian population by such means as blackouts, camouflage, civilian evacuation, protective construction and other defense against air attacks. Also it developed programs of rescue of endangered persons, demolition of damaged structures and clearance of necessary thoroughfares, repair of disrupted utilities, auxiliary fire and police services, and many other measures to combat war-related emergencies and disasters.

**Protective Property Division.**—This division administered the protective property and equipment purchased by the federal government for loan through the Office of Civilian Defense to states and communities in accordance with the provisions of the act approved Jan. 27, 1942 (56 Stat. 19; 50 U.S.C. App. 741), which authorized an appropriation of \$100,000,000 for this purpose.

**Industrial Protection Division.**—This division provided assistance to industrial plants regarding protection against war-time industrial hazards such as fire and accidents and against enemy action such as sabotage.

The director of the Office of Civilian Defense, until its termination, was the chairman of the defense board, William N. Haskell. (See also MUNICIPAL GOVERNMENT.)

(W. N. HA.)

**Great Britain.**—With the end of the European war, the year 1945 saw also, of course, the end of air attacks against the civil population of Great Britain, the last enemy air-borne missile, a flying bomb, falling on March 27. When all air attacks ceased on this date London and S.E. England had been under more or less continuous bombardment by mechanical weapons for nine months.

The tale of the final series of attacks is one of flying bombs and rockets. When the 1944 account was written the first rockets had fallen, but no mention of the fact was permitted. Actually rocket attacks began on Sept. 8, 1944, and ceased on March 27, 1945.

When the 12 weeks of heavy attacks by land-launched flying bombs had ceased at the beginning of Sept. 1944, the enemy resorted to attacks by the same weapon launched from aircraft, and these continued until the end of March 1945. The air-launched flying bombs were supplemented and largely replaced at the beginning of the year by longer range flying bombs launched from land sites in the Netherlands. The scale of attack

was, however, very greatly reduced compared with the main assault and the attacks had little more than a nuisance value. A high proportion were destroyed where they could do no harm. London remained the main target, save for one excursion directed against the Liverpool-Manchester area by flying bombs launched from aircraft. It met with little success except to remind the north country that it was not immune from attack.

The rockets continued throughout this period and presented to civil defense services much the same problem as the flying bombs except that no warning was possible. The daily scale of attack was much less than the flying bomb at its maximum and the attacks were scattered in the main. Rockets had a greater penetrative effect than flying bombs and therefore caused damage, at times, to water, gas, electricity and other public services. But the civil defense services were able to deal successfully with them.

As victory neared the risk of air attack dwindled until it could be safely said that the threat had disappeared. The civil defense services were accordingly officially suspended on May 2 and the process of winding up the organization began. The national fire service, having a peacetime function, was not suspended, but its numbers were reduced. Further activities of all kinds seemed likely to keep a considerable part of the W.V.S. employed for a long time. A farewell parade was held by the king with the queen and Princess Elizabeth in Hyde Park on June 10 when the king took the salute at a march past, after an inspection of the parade, and himself addressed the parade before it dismissed. At the close of the year it was announced that the home guard would be finally disbanded on Dec. 31. This force had totalled, at the end of Aug. 1944, 1,727,098 men and 30,696 women auxiliaries in Great Britain, excluding Northern Ireland. (E. J. H.)

Use of the atom bomb affected the government's attitude to the future of British civilian defense services, and in moving the second reading of the Civil Defense (Suspension of Powers) bill in the house of commons on Nov. 5, the home secretary, J. Chuter Ede, drew attention to the fact that the original technique of civil defense was out of date. The government had directed that careful study should be made of the effects of the latest form of air attacks, and civil defense was to be reviewed to see what modifications were required to adapt it to future needs.

The bill suspended certain obligations on local authorities regarding civil defense schemes and also suspended a number of provisions of the Civil Defense act. It left operative provisions of the act of existing or continuing importance. Should the time come to revive certain provisions, orders in council could be made. When it was possible to devise a new technique it was intended to begin in a quiet and orderly manner rebuilding civil defense within the framework of legislation already sanctioned. Should radical alteration of the system be necessary new proposals would be submitted to parliament. (See also GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF; LONDON.)

**Civilian Production Administration:** see PRIORITIES AND ALLOCATIONS; WAR PRODUCTION BOARD.

**Civil Liberties.** The year 1945 represented further advances in the field of civil liberties. There were only a score of cases involving federal action touching on freedom of speech during World War II as compared with indictments of more than 2,000 persons in similar cases during World War I. Furthermore, substantial advances were made in the field of racial discrimination. The U.S. supreme court unanimously struck down as unconstitutional the detention of loyal

U.S. citizens in the U.S.-Japanese test cases. In New York state, the passage of the Fair Employment Practice act marked a new approach to diminishing religious and racial discrimination in the fields of employment. Similar legislation was passed in other states and was pending in the congress. All of the services finally admitted Negroes to the armed forces. The U.S. supreme court, moreover, voided contracts between railroads and unions in which firemen were excluded from collective bargaining.

The U.S. supreme court upheld the New York statute prohibiting racial discrimination in the admission to unions.

Organized bigotries against Catholics and Jews continued, although there was a growing movement in favour of making public the income of all such organized groups, most of whom claimed tax exemption. Further, in the field of opinion as distinguished from overt acts, the U.S. supreme court voided the deportation order against Harry Bridges, alleged communist labour leader.

In the field of letters, the exclusion by the postmaster of *Esquire* magazine from second class mailing privileges was reversed in the court of appeals of the District of Columbia, and was before the U.S. supreme court for review. The post office claimed the right to so exclude magazines on the ground that cheap postage is to be allowed only to periodicals serving the public good.

Massachusetts continued its record of book banning—the only state still banning books—and the decision of the lower court banning *Strange Fruit* by Lillian Smith, a novel of distinction, was sustained in the highest court.

Mayor LaGuardia's persistent practice of eight years of censoring the theatre of New York city was evidenced during 1945 by his use of the licensing power exercised on the closing of *Trio* which LaGuardia thought treated with an objectionable theme, to wit: lesbianism.

A decision of the U.S. supreme court required the Associated Press to amend its practice which, up to that time, prohibited competing newspapers in the same area from vetoing applicants from membership to the Associated Press. The U.S. supreme court, pursuant to decisions laid down in motion picture and radio cases, continued to insist on appraising, vis-a-vis monopoly statutes, movies, radio and press as deserving higher standards of free enterprise than would apply to potatoes or other commodities. The case pending against eight motion picture giants which were alleged to dominate the production and distribution of motion pictures in the United States was to be tried during 1946.

With the close of the war an accelerated interest developed in the United States with respect to international freedom of thought. There was imbedded in the U.S. folkway the concept that world peace depends primarily on the free flow of movies, radio and the printed word—free of governmental or private economic restrictions of the market places of thought. Whereas the United States became substantially free from governmental restraint of thought, many of the other nations of the world were moving in the totalitarian direction and were imposing restrictions in the form of movie quota-laws, currency controls and additional taxation to prevent the free exchange of ideas. Various commissions from the United States toured the world in order to appraise this situation, with particular reference to the restrictions on the right of reporters, camera men and broadcasters freely to roam other nations. The Henry R. Luce Commission on Freedom of the Press finished its hearings and was to make its report in 1946. (See also ALIENS; ANTI-SEMITISM; BIRTH CONTROL; EDUCATION; LAW; LYNCHING; NEGROES [AMERICAN]; NEWSPAPERS AND MAGAZINES; RADIO.)

(M. L. E.)

**Civil Service, U.S.** Repercussions of world events in 1945 were felt with compelling force in government civil service, particularly at the national level. Whereas the beginning of the year found governmental machinery geared to an all-out war effort, within a few months victories in Europe and the Pacific brought swift cessation to many war-related government activities. By the latter part of 1945, the transition from war to peace was in full swing, with demobilization of the great army of wartime civil servants well under way.

The magnitude of this transition is illustrated in the federal civil service employment figures for the U.S. during the year. As the year began, civilian employees of the federal government numbered 2,859,737. This total increased somewhat in subsequent months, until at the end of March it reached the peak for the year, 2,920,410 employees. By the end of August, a reversal of the trend brought the number of employees back below the total recorded at the beginning of the year, and by the end of December, federal employment figures stood at 2,405,000, a net decrease of 500,000 employees from the high point of the year.

Most of the cutbacks in federal personnel were in the war and navy departments and in other wartime agencies. Because of this large-scale personnel reduction, the United States civil service commission announced an indefinite suspension in the acceptance of applications for employment from the general public except from war veterans, and devoted its major efforts toward accomplishing the reduction in force in an orderly, equitable manner.

The gradual decline in state and local government employment in the U.S., a trend dating back to the beginning of World War II, was in considerable measure offset by the return of large numbers of former employees following their release from the armed forces. Unlike the conditions confronting the federal government, the end of the war brought no need for demobilizing civilian employees in the states and cities, and many of these latter jurisdictions began taking steps to replenish their depleted personnel.

As the end of the war approached, the work week of federal employees was cut from 48 to 40 hours, bringing with it substantial reductions in pay through the curtailment of overtime hours at premium rates. To offset this decrease in income, legislation was adopted which raised the base pay rates of federal employees by amounts ranging from 20% in the lower levels to 10% and less in the highest paying positions. At the same time, the bulk of the federal service was placed on a five-day work week.

The year marked the passage of new civil service laws in two states, Oregon and Nebraska, the latter being limited to certain categories of clerical employees. Enactment of these laws increased the number of states having civil service laws to 22. In two additional states, Missouri and Georgia, newly adopted state constitutions called for the future enactment of civil service laws for state employees.

Civil service legislation in other localities during 1945 was largely concerned with rights and benefits for war veterans. Measures expanding already existing preference to veterans in public employment were adopted in the states of Illinois and New York, the latter by constitutional amendment. The cities of Detroit, Mich., and St. Louis, Mo., were among those adopting new veterans' preference policies, the St. Louis preference measure being limited to five years after the war. (J. J. Dn.)

**Clark, Mark Wayne** (1896- ), U.S. army officer, was born May 1 at Madison Barracks, N.Y., where his father, Col. Charles C. Clark, was then stationed. A graduate of West Point in 1917, he saw service on the

western front in World War I and was wounded in June 1918. He was graduated from the Command and General Staff school, 1935, and the Army War college, 1937. In Aug. 1942, he arrived in England to take over command of U.S. ground forces in the European theatre of operations, and in Nov. 1942, he was second in command of the U.S. forces that landed in North Africa. Three weeks before the invasion, General Clark and a group of U.S. officers were secretly landed on a coastal point in French North Africa. They established contact with French officers eager to co-operate with the United States and secured an agreement from these officers not to resist the Allied landings. He was awarded the distinguished service medal and the congressional medal of honour and promoted to a lieutenant general for this mission.

It was in North Africa that Lt. Gen. Clark gathered and trained the U.S. 5th army which he commanded in the invasion of Italy. In Nov. 1944 Lt. Gen. Clark was made commander in chief of the Allied 15th army group in Italy, succeeding British General Alexander, who was promoted to field marshal in supreme command of the entire Mediterranean theatre. Clark was nominated to the temporary rank of full general, March 13, 1945. The following month his armies launched the final assault against German troops in Italy, and on May 2 the German forces in northern Italy and in some sections of Austria laid down their arms to Clark's forces. He was designated (June 28) commander of U.S. occupation forces for Austria.

**Clark, Thomas Campbell** (1899- ), U.S. lawyer and attorney-general, was born Sept. 23 in Dallas, Tex. He was graduated with an A.B. degree from the University of Texas (1921) and practised law. He was civil district attorney of Dallas county, 1927-32. In 1937, Clark was made special assistant to the attorney-general of the U.S. He was shifted to the department's antitrust division (1938), was later named co-ordinator of alien enemy control in the Western Defense command, and was given charge of the War Frauds unit in the antitrust division in May 1942. Clark became assistant attorney-general of the antitrust division (March 1943) and carried on an active battle against cartels, which he described as "private economic super-governments." In Aug. 1943, he headed the justice department's criminal division with his authority extending to the War Frauds unit. President Truman named Clark to succeed Francis Biddle as U.S. attorney-general, May 23, 1945. Clark assumed office June 30. He ordered prompt prosecution of black market cases (July 29) and a drive to round up income tax evaders. On Sept. 17, he recommended that congress act to reorganize and subdivide the Aluminum Company of America, warning that failure to do so would require government subsidization of Alcoa competitors to restore free competition in the aluminum industry.

**Clarke, John Hessin** (1857-1945), U.S. jurist, was born Sept. 18, in Lisbon, O. He was graduated from Western Reserve university in 1877 with an A.B. degree and was admitted to the Ohio bar the following year. He practised law in his home town, moved on to Youngstown and Cleveland and in 1914 received an appointment as U.S. district judge for the northern district of Ohio. Early in his law career he joined Mayor Tom Johnson of Cleveland and Newton D. Baker in fighting the railway monopolies. In 1916, President Wilson named him associate justice of the supreme court to succeed Charles Evans Hughes. Outspoken and vigorous in his pursuit for world peace, Clarke provoked cries of "idealist" and "visionary" from his critics. Breaking a traditional precedent of the court, whose members refrain from

public speeches, he publicly urged in 1921 the cancellation of war debts. In 1922, he resigned from the bench and devoted his talents and energy toward rallying public opinion behind a world peace movement, adherence to the League of Nations and the outlawry of war. He was president of the League of Nations Non-Partisan Association of the U.S., 1922-30. Clarke died in San Diego, Calif., March 22.

**Clay, Lucius DuBignon** (1897- ), U.S. army officer, was born April 23 in Marietta, Ga. He was graduated from the U.S. Military academy in 1918, and during the latter days of World War I was an instructor at an officers' training school. Clay taught military science and tactics at Alabama Polytechnic institute (1921), and was assigned as an instructor at West Point (1924). During the following years, Clay was associated with a number of army construction and engineering projects in the United States and abroad. A month after the U.S. entry into World War II, Gen. Clay went to South America to locate defense airports there. On his return, he was made deputy chief of staff for requirements and resources in the Army Service of Supply (March 1942), and he was promoted to temporary rank of major general (Dec. 1942). Clay brushed aside antiquated war department methods and, as the war in Europe drew to a close, he opposed implementation of reconversion plans on the ground that the army had to keep its military supplies at peak requirements until the Germans actually and finally surrendered. In the fall of 1944, Gen. Clay was sent to Cherbourg where he straightened out kinks obstructing the smooth flow of war supplies through that vital Allied port. In Dec. 1944, he was transferred to the Office of War Mobilization and Reconversion as deputy director for war programs and administration. On March 29, 1945, President Roosevelt appointed Gen. Clay deputy to Gen. Dwight Eisenhower in charge of civil affairs in occupied Germany, and Clay was named a lieutenant general the following month. In addition to being Eisenhower's deputy, Clay was also head of the U.S. group of the Control Council for Germany and deputy military governor of the U.S. zone of occupation. Gen. Clay stated (May 26) that the Germans would have to become dependent on their agriculture for their food requirements. He later revised his views on German self-sufficiency in foodstuffs, declaring (Nov. 5) that as there were no "substantial amounts" of food in Germany, the U.S. army authorities would ask the war department for 300,000 tons of food to supply civilians in the U.S. occupation zones.

**Clays.** Shipments of kaolin in the United States declined from 929,437 short tons in 1943 to 873,056 tons in 1944, accompanied by a lesser decrease in value. Although the common name for this type of clay is china clay, only 10% of the 1944 output was used in pottery, against 19% in refractories and 59% in paper. Sales of ball clay rose from 147,795 tons in 1943 to 155,667 tons in 1944, mostly used in pottery. Consumption of fire clay also declined in 1944, to 6,344,383 tons, against 7,798,233 tons in 1943. Of these totals the tonnages sold or shipped as raw clay were 4,701,144 tons in 1943 and 3,804,404 tons in 1944. The remainder was burned into clay products at the point of production. Miscellaneous clays, used mostly in cement and heavy clay products, declined from 11,215,276 tons in 1943 to 9,080,717 tons in 1944. (See also BENTONITE; FULLER'S EARTH.) (G. A. Ro.)

**Clendening, Logan** (1884-1945), U.S. physician and writer, was born May 25 in Kansas City, Mo. He studied at the Universities of Michigan, Ann Arbor, Mich., and Kansas, Lawrence, Kan., receiving his M.D.

from the latter institution in 1907. He began the practice of medicine in Kansas City in 1909, and in the following year joined the faculty of the University of Kansas, becoming professor of clinical medicine in 1928. His *Diet and Health* column, syndicated to more than 400 newspapers, reached millions of readers daily. He wrote *The Human Body* (1927), *The Care and Feeding of Adults* (1931) and *Source Book of Medical History* (1942). Ill for some time, Dr. Clendening was found dead at his Kansas City home, Jan. 31; police believed he had taken his life.

**Cleveland.** Sixth largest city in the United States, Cleveland, O., had a population of 878,336 by the federal census of 1940. Area 73.74 sq.mi.

Thomas A. Burke, Jr., a Democrat, was elected mayor of Cleveland at the Nov. 6, 1945, election, defeating his Republican opponent, Councilman Ray C. Miller, by 65,854 votes. Burke, who was previously city law director, became mayor Jan. 8, 1945, when his predecessor, Frank J. Lausche, took office as governor of Ohio. Mayor Burke's first elected term began Nov. 14, 1945. The city's budget for 1945 was \$19,000,000, the largest in its history.

Mayor Burke appointed Lee C. Howley, member of the Cleveland board of education and assistant U.S. attorney, as city law director. The city council established a community relations board for handling interracial problems and the mayor reorganized the Cleveland port and harbour commission. Police Chief George Matowitz was suspended by Mayor Burke but was completely exonerated of the suspension charges by the civil service commission.

Other events in 1945 included the following: Guy R. Lucas was appointed postmaster of Cleveland. The Cleveland board of education elected Mrs. Norma F. Wulff president and approved a budget of \$15,657,331. A campaign was launched to raise \$9,500,000 for construction of four new hospitals and expansion of 13 others. On the death of Archbishop Joseph Schrembs of the Cleveland Catholic diocese the Most Rev. Edward Hoban became sixth bishop of Cleveland. Construction began on 13 new buildings to increase capacity of the army's Crile General hospital. A sesquicentennial commission was appointed to arrange for the celebration of the 150th anniversary of the founding of the city throughout 1946.

The value of products made by Cleveland industry in 1945 was close to \$3,000,000,000 or more than twice the average peacetime production. The Cleveland area produced 3,905,174 tons of ingot steel during the year. Seventy-three new manufacturing plants with a combined pay roll of \$2,647,400 were established in the city. War materials made in the Cleveland ordnance district during World War II amounted to approximately \$5,000,000,000. Deposits of the Cleveland Trust Co., the city's largest bank, passed the \$1,000,000,000 mark. The city's tax rate was \$2.98 per \$100 value and the assessed valuation of land and buildings in the city was \$957,651,270.

(P. By.)

**Climate:** see METEOROLOGY.

**Clothing Industry.** The year 1945 was a year of hard work within the clothing industry in the United States. End of the war meant termination of millions of dollars in government contracts; only relatively few manufacturers received new contracts. War contract termination went smoothly due to excellent planning by the army quartermaster corps and the navy bureau of supplies and accounts. All factors jockeyed for position in the postwar era.

Unlike most industries there was little labour trouble—wages

were high, with a 30% increase granted the regular clothing workers in the latter part of the year; this presaged higher consumer prices in 1946.

War-born shortages plagued the industry as never before; black market operations, from mill to consumer, were not infrequent. Manufacturers complained bitterly against ceiling prices applied to them by government control that were based on prices and costs of 1943. The textile situation was difficult all 1945—most difficult at the year's end. Consumers felt the tight situation in the scarcity of all apparel. Numerous efforts to circumvent government pricing policies were reflected in the popularity of "boxer" type undershorts and a great influx of "mill end" fabrics. In a determined drive to lower the upward spiral of clothing prices the Office of Price Administration (OPA) used textile distribution as a lever, thus channelling woollen goods into the low-priced field. The result was that at year's end manufacturers were in many instances refusing to make deliveries. Returning war veterans could not find civilian clothing.

Cotton goods were even scarcer than woollens. Labour shortages, high taxes and mechanical difficulties discouraged cotton mills. Work clothing, shirts, pajamas and underwear were sold from under, not over, the counter in many retail stores. Lining, pocketing and other trimmings shortages hindered production. Finally, in December, the Reconstruction Finance corporation (RFC) offered 5,500,000 yd. of war surplus nylon and rayon lining to the trade. Styles were generally unchanged; indicated was a probable change in the historic dress of U.S. sailors.

Caught in the whirlwind of reconversion the industry nevertheless planned ahead. All over the world clothing manufacturers longed for U.S. machines and methods—and were determined to get both. France and England were definitely turning from the custom tailor, and were going in for mass-produced, machine-made, good quality clothes. Machinery manufacturers, hampered by reconversion, shortages and strikes, managed to introduce new high-speed cloth laying, automatic folding and non-fusing cloth-cutting machines. Research continued.

Few new fibres, finishes and coatings appeared on the civilian market. Synthetics made progress and sewing-machine companies were busily engaged in research on an electronic machine to fuse plastics, including nylon. New methods of making fabrics by lamination, knitting and weaving were introduced. A novelty item was the use of deboned chicken feathers in weaving.

World-wide, mankind shivered in the cold. Japanese, German and Italian mills and factories were decimated. The Allies suffered too; in Britain clothing stocks reached record lows.

**Coal.** World Production.—During World War II world data were too restricted to permit any reliable estimates of world output, but conditions improved sufficiently that most of the gaps were filled in the world production table for the important producers. However, no data up to the close of 1945 were received from Germany.

After 1939 coal production in the United States increased by more than half, but this was not representative of other producers. The countries for which production figures were available for both 1939 and 1943 showed an increase of 216,000,000 short tons, but of this total increase 205,000,000 was made in the United States, leaving only a meagre share for the rest of the world that could easily be wiped out entirely when full data became known.

With the war ended, one of the most important problems facing the coal industry was the restoration of the industry to a

peacetime basis. In the United States this was a minor matter, as it involved only the scaling of the output to current demand; so far as the producing facilities were concerned, it made no difference whether the output was shipped to a munitions plant or an automobile plant, and the producing facilities themselves needed no reconversion, as did a manufacturing plant. In Europe, however, the situation was greatly different, and the problem was not reconversion, but rehabilitation both with respect to the physical plant and the labour supply. The disorganization that followed the German surrender left the coal industry of most of the occupied countries in even worse shape than it was during the occupation. In some of these countries the prospective fuel supply for the winter was so scanty that the populace was facing not only the hardship of a winter with little or no heat, but also starvation through lack of sufficient fuel to process the limited food supplies that were available.

**United States.**—Coal output in the United States increased from 650,820,689 short tons in 1943 to 683,701,000 tons in 1944, an increase of 5.1%, to which anthracite and bituminous contributed about equally. The salient data of the industry during the war years is listed in Table II.

Table II.—*United States Coal Production*  
(Thousands of short tons)

	Bituminous	Anthracite	Total	Consumption	Men Employed
1939 . . . . .	394,855	51,487	446,342	376,296	422,000

1945 (est.) . . . . .	573,840	54,610	630,450	?	?

The weekly production rate for bituminous coal dropped below that for the corresponding weeks of the previous year in Nov. 1944 and kept low through the first three quarters of 1945. There was a similar lag in anthracite, with an almost complete stoppage during most of May 1945, and the year's total dropped accordingly.

In the latter part of Sept. 1945 sporadic strikes began in the bituminous mines, cutting production in half by mid-October. While there seemed to be little if any hope for an early settlement of the differences, the strike was suddenly called off "in the public interest" on Oct. 18, the strikers returning to work on the following Monday. It was estimated that at least 20,000,000 tons of production had been lost by the strike, at a time when coal was badly needed both at home and abroad. Stocks of coal had been cut to a low level by war demand, and the U.S. was in a poor position to face a prolonged strike, even had other conditions been normal. Instead, the winter supply for domestic heating had been curtailed by rationing, coal was needed for export to Europe, and on top of everything else, the reconversion program was just getting under way. All things considered, the situation was serious from a consumer's standpoint, a fact which had doubtless been considered as an asset by the labour leaders responsible for the strike. The sudden calling off of the strike was

never properly explained.

Even a superficial analysis of the situation revealed that the timing of the strike was a poor policy from a labour viewpoint. It is true that conditions were such as to give labour a strong position to enforce its demands, but the long-term viewpoint was not promising. It is quite possible that a prolonged

shortage of coal just at the time reconversion was under way could have enabled the competing fuels, oil and gas, to have made such inroads on future coal demand as to offset any immediate advantage that labour could have gained from a successful settlement of the strike on the terms demanded. (See also FUEL BRIQUETTES.) (G. A. Ro.)

**Great Britain.**—Coal production in Great Britain decreased from 222,789,500 short tons in 1943 to 215,875,200 tons in 1944, of which 206,190,200 tons was from underground mines and 9,685,000 tons from open pits. Underground output decreased, while open pit output increased. The number of mines in operation dropped from 1,782 in 1943 to 1,720 in 1944, but the number of men employed rose from 707,800 to 710,200. Output per man-year was 307.8 short tons in 1943, at a cost of 25s. 2d. per ton. In 1944 output per man dropped to 290.3 tons, while costs rose to 28s. The surplus for export was relatively small, as home consumption was estimated at 207,648,000 tons.

Production losses from all causes except absenteeism totalled 15,817,200 tons, distributed as follows: authorized holidays 9,512,800 tons; disputes 3,361,900 tons; accidents, breakdowns and repairs 1,796,300 tons; transportation difficulties 658,400 tons; other reasons 487,800 tons. Losses due to absenteeism were not reported, but 41% of the total was voluntary and 59% involuntary.

Throughout 1945 the coal position continued to deteriorate and Great Britain, in spite of economies amounting to hardship in the case of the householder using coal for cooking and heating, was threatened with a coal famine in the spring of 1946. The output per person employed in the industry continued to fall during the year; there was a small but insignificant increase in the number of persons employed and stocks were depleted. It was officially stated by government speakers that unless an extra 8,000,000 tons were produced during the autumn a serious crisis would arise. As this represented a 12½% increase in output without a corresponding increase in labour, the prospect was gloomy.

Output had been steadily declining after 1941 and had started on the downward trend before the government took what was virtually control of the coal mines in 1942. Many remedies had been prescribed to overcome the decline without any real success. With the advent to power of a Labour government the most drastic remedy of all was to be applied, namely, nationalization of the whole industry. It is interesting to note that responsible Labour speakers were already warning the miners that nationalization would not mean less labour for the workers, but probably more to enable them to implement their promises to produce extra coal when the mines were nationalized.

On Dec. 19 the minister of fuel and power presented to the house of commons a Coal Industry Nationalization bill. Its purpose was to nationalize the coal industry in Great Britain, including not only the working, getting and supplying of coal but certain allied activities, in particular, colliery coke ovens and other ancillary plants.

A national coal board consisting of nine persons was to be established to have the exclusive right, with very minor exceptions, to mine and get coal, to secure the efficient development of the industry and to make supplies of coal available in quantities and at prices which seemed best calculated to further the public interest. The existing colliery owners were to be compensated by an issue of government stock, the global amount of which was to be decided by an arbitration tribunal. This global amount would be divided among districts by a central valuation board and the district allocations by district valuation boards. The national coal board was to be authorized to borrow up to £150,000,000 during the first five years of its life to satisfy capital expenditure necessary to rejuvenate the industry. The bill also would empower the national board to assume the functions previously exercised by the Coal Owners' association, the coal commission and the Miners' Welfare committee.

Two interesting plans for reviving the industry were published during 1945. The first, the Foot plan, was devised by the newly appointed chairman of the Mining association (the owners) and received official acceptance from the majority of the owners. Preliminary steps were being taken to implement it when the general election intervened. The second, the Reid report, was prepared by a panel of mining engineers convened by the minister of fuel and power. This report, probably the most outspoken document ever written for publication by members of the mining industry, analyzed the causes of the existing low output per person employed, compared the British industry unfavourably with that of certain continental countries and the U.S., and made suggestions involving drastic changes in British methods. In addition to these reports the publication of statistical digests was resumed.

The purchase of all unwrought coal was completed by the coal commission for £65,000,000.

Extremely useful surveys of the coal reserves in each region, which were completed by regional committees, contain information of great value to the future planning of a nationalized industry. It appeared that in the future each variety of coal would be used for the purpose for which it was most suited and not sold regardless of the use to which it was to be put.

Opencast coal mining, largely through the use of U.S. machinery, in 1945 was expected to produce about 9,000,000 tons of coal; but it was considered reasonably certain that this method of winning coal would be discontinued as soon as possible. The cost of getting is too high for the method to be economically profitable in Britain. (J. A. S. R.)

**Austria.**—Prewar consumption of coal was 7,700,000 tons a year, half of which was imported. With the output in 1945 only one-quarter normal and imports scarce, conditions were serious. In the immediate postwar days Hungary was the only source of imports, but supplies were expected from Poland somewhat later.

**Belgium.**—In Sept. 1945 production had improved to 69,000 short tons daily, about two-thirds normal.

**Canada.**—Coal output decreased from 17,859,057 short tons in 1943 to 17,010,117 tons in 1944, of which 11,767,523 tons was bituminous, 728,364 tons was sub-bituminous, and 4,514,230 tons was lignite. Declines in output were chiefly in Nova Scotia and Saskatchewan. There was a small increase in demand with imports up and exports down to a minor degree. Net imports were 27,742,553 tons in 1943, rising to 27,916,685 tons in 1944.

The preliminary estimate of 1945 production was 16,692,465

tons, a reduction of 2% from 1944. There was a sharp decline in imports, which were 17,693,256 tons through September.

**Czechoslovakia.**—Due to labour shortage, production was only 490,000 short tons in Aug. 1945, against monthly requirements of 880,000 tons.

**France.**—Under a decree dated Dec. 13, 1944, the state assumed the administration of the coal mines in the departments of Nord and Pas-de-Calais, and it was expected that the other important producing areas would be added later. Production was improving, but was still below normal requirements. Output late in Sept. 1945 was 835,000 tons weekly, or about 10% below the minimum requirements.

**Netherlands.**—Output in July 1945 was 17,600 short tons daily, as compared with a minimum requirement of 28,600 tons, a prewar output of 49,500 tons and one of 37,400 tons under German occupation.

**Poland.**—An agreement was completed under which Polish coal would be supplied for the Rumanian railroad system. No production figures were seen, but apparently the resumption of normal operation was making fairly good progress.

**FILMS.**—*Distributing Heat Energy; Fuels and Heat* (Encyclopædia Britannica Films Inc.). (G. A. Ro.)

**Coast and Geodetic Survey, U.S.** The operations of the United States Coast and Geodetic survey, which at the opening of the year 1945 were proceeding under plans for providing complete surveys of the outermost Aleutian Islands and adjacent waters, navigational charts of all coastal waters and aeronautical maps of the land areas of the United States, continued throughout the year. The need which had existed for these products of the bureau continued, as was indicated by the number of navigational charts compiled and printed. There were 3,500,000 marine and 6,000,000 aeronautical charts issued. Twelve survey ships were engaged in the Aleutians, in the waters of the Pacific northwest and along the Atlantic shore line from the Virginia capes to the islands off the Maine coast. A survey expedition provided essentially vital information to naval activities on the Arctic coast eastward of Point Barrow.

The direction and intensity of the terrestrial magnetic field were observed continuously at five permanent observatories located at strategic magnetic points in the United States, the West Indies, Alaska and the Hawaiian Islands. Changes in variation and in other magnetic elements were also noted at various places by field observers. Isogonic charts were published for army and navy fliers over world routes.

The survey operated five major seismographs and continued its co-operative program of assistance and compilation of results for 11 universities and 7 private seismic stations. In the earthquake region of the western United States, 60 strong motion instruments were maintained and studies of vibration in buildings and foundations advanced the work in progress in engineering seismology.

The work in geodesy reflected the shift from World War II requirements to preparation for postwar development, especially in the consideration of multiple water uses in some of the main river valleys. For the purpose of investigation by other federal agencies for flood control, power, reclamation and recreation, geodetic control surveys, which included triangulation, base measurements, astronomic observations and precise levelling, were carried out in the tributary stream valleys of the Columbia and Missouri river basins. Control surveys were provided for topographic mapping in several states. A breakdown of the main cross-country triangulation arcs was performed to provide additional area coverage at the request of several city and state engineers for engineering and planning projects.

An expansion of previous co-operative projects in surveying and mapping within the American Republics was effected to the material benefit of these countries by an exchange of experts and technical personnel and by further scientific field observations and discussions.

Publications were issued on "Practical Air Navigation," "General Theory of Equivalent Projections," "U.S. Earthquakes," "State Coordinate Systems," "Prediction of Tides of the World" and "Coast Pilots of the United States." (L. O. C.)

**Coast Guard, U.S.** With the capitulation of both Germany and Japan to the Allied powers during the year 1945, the U.S. coast guard turned to applying the scientific developments of the war years to one of the service's main peacetime missions, that of saving and protecting life and property on the sea and navigable waters of the U.S.

Aids to navigation used for war purposes were removed during the last part of the year, and lightships, not used during World War II, once more took up their positions. The number of new aids counterbalanced the aids removed, so the coast guard continued to maintain more than 36,000 aids to navigation (lightships, lighthouses, buoys, day marks, fog signals and radio beacons). Developments put to greater use upon the war's conclusion were Anrac control stations and Racon stations. Anrac—with its name derived from the beginnings of a descriptive phrase, Aids to Navigation RADio Controlled—is a radio device to light and extinguish electric lights and operate fog signals; Racon (RADar beaCON) gives distance and bearing, of an aeroplane or ship within 120 miles from such a beacon. By the middle of 1945 the coast guard had installed and was operating 45 Racon stations on the Atlantic and Pacific coasts and in Hawaii and Alaska. One of the navigation improvements of the war years was the Loran radio transmitting station (LONG Range Aid Navigation), used to obtain longitude and latitude positions. Concurrent with the landing of Allied forces on Iwo Jima and Okinawa, the coast guard mobile construction units installed Loran, providing lines of position over the Japanese mainland and contributing to the success of U.S. bombers. By midyear the coast guard was operating 64 fixed and 17 mobile Loran stations.

The important part played by aeroplanes during World War II and the improvements made in aircraft portended increased air travel and gave impetus to a movement for a better life-saving organization, which combined radio, air and sea power. Established in 1944, the air-sea rescue agency, which guides this life-saving organization, has the commandant of the coast guard as its head, assisted by a board of representatives from the army and navy. In support of air-sea rescue aircraft, a vessel organization of 98 coast guard manned vessels was assigned on June 30, 1945, representing a considerable increase.

The coast guard's nine air stations in the continental U.S. began a greater concentration on rescue activities upon the conclusion of the war, and in Greenland, Labrador, Iceland and the Canadian Arctic a coast guard-manned squadron (navy patrol bombing squadron 6) continued ice observation and assistance operations. During the war this squadron, as well as the nine air stations, carried out antisubmarine patrol and convoy escort duties.

The coast guard continued the administration of marine inspection and navigation laws, a function assigned to it in 1942, and during the fiscal year ending June 30, 1945, certificated for service 1,627 new vessels constructed during that period. These vessels were examined during construction for compliance with specifications, matériel inspections were made at factories and examinations continued after the ships were in use. Annual inspections were completed on 9,720 vessels during the fiscal year,

an increase of about 16% over the previous year.

Following the defeat of Germany, the coast guard reduced forces doing port security and beach patrol work, and with the surrender of Japan these operations were further curtailed, but fire protection, prevention of oil pollution, anchorage and traffic control of vessels and other protective measures were not discontinued. There were 5,978 instances in which coast guard units were dispatched to assist vessels and persons in distress during the fiscal year, and in such operations 4,630 persons were rescued from peril. During three floods inundating the Ohio and Mississippi valleys during the spring of 1945, coast guard task forces, augmented by planes and a helicopter, effected the rescue of more than 10,000 persons, evacuated thousands of head of cattle and transported food, medical supplies, mail and household effects. Icebreaking operations to keep the Great Lakes and North Atlantic ports open to commerce were carried out as usual during the ice season.

Although slated for return to the U.S. treasury department, the coast guard continued to function even after hostilities had ceased under the navy department, to which it had been assigned for emergency service on Nov. 1, 1941. The coast guard's military duties during 1945 continued along the same lines as earlier in the war and included working with naval units as convoy escorts, antisubmarine patrol, protection of U.S. ports, manning of troop transports, performing landing operations and maintaining Racon, HF/DF (High Frequency Direction Finder) and Loran stations. Along with these missions, the coast guard was responsible for its regular peacetime duties. In addition to the 1,677 coast guard craft in active service on June 30, 1945, about 300 U.S. navy and 250 U.S. army vessels were being manned by some 55,000 coast guardsmen. Two of the largest task forces operating with coast guard personnel were the Greenland patrol and North Atlantic oceanic weather observation service. Besides patrolling the Greenland coast to prevent German attempts to establish weather bases, breaking ice to keep channels open and assisting in convoy operations, the Greenland patrol made reports to aid safe passage of shipping during the ice menace season. The weather patrol made reports contributing to the safety of air traffic and of troop and munition movements.

On Sept. 1, 1945, the personnel strength of the coast guard, exclusive of the temporary reserve but including the women's reserve (SPARS), was 170,480. Also attached were more than 600 medical and dental officers and nurses detailed from the public health service. The authorized force of civilian employees on June 30, 1945, was 6,827. The postwar program called for a military strength of 34,500, so after the end of hostilities disenrolment or demobilization of various groups augmenting the regular coast guard proceeded with increasing rapidity.

The vessel organization on June 30, 1945, consisted of 1,677 craft, ranging in size from 327-ft. cutters down to 36-ft. motorboats. During the fiscal year construction was completed on one 290-ft. icebreaker, two 269-ft. icebreakers, four 255-ft. cruising cutters, twelve 180-ft. tender-class cutters and numerous small vessels.

**Coast Guard Academy, U.S.**—The United States Coast Guard academy at New London, Conn., founded in 1876, is an institution of higher learning for the training of commissioned officers for the coast guard. Its present home, overlooking the Thames river, was constructed in 1932, with additions made just prior to World War II. The red brick, Georgian colonial buildings centre around the administration building, Hamilton hall, named after Alexander Hamilton, first secretary of the treasury and founder of the coast guard in 1790.

To enlarge the wartime officer complement the academy gave a four-month indoctrination course for reserve officers and

adopted an accelerated three-year curriculum for the regular cadets, but discontinued the reserve program before the close of the war and put the regular course of study back on a four-year basis in July 1944. The cadet corps in peacetime totalled between 200 and 300, about 150 entering each year, but in 1945 the future enrolment was expected to be around 500. Entrance is restricted to unmarried men between 17 and 22 years of age, and appointments are obtained through competitive examinations. When the annual tests in mathematics, English and general adaptability were given in designated U.S. cities in May 1945, 375 of the 2,265 candidates received passing marks. The academy confers upon its graduates the bachelor of science degree and a commission as ensign in the United States coast guard. During the fiscal year ending June 30, 1945, 97 cadets were graduated. (R. R. W.)

**Women's Reserve, U.S. Coast Guard Reserve.**—The training program of the women's reserve of the U.S. coast guard was much curtailed in 1944 when the reserve reached its required complement, and within one month after the end of World War II in 1945 all enlistments and training were discontinued. Popularly known as SPARS, the members of the women's reserve numbered 9,764 on Dec. 9, 1944, 9,780 on June 30, 1945, and 8,468 (808 officers and 7,660 enlisted women) on Nov. 13, 1945; demobilization was to be completed by June 30, 1946. This would represent a life of nearly four years for the organization, which was established on Nov. 23, 1942.

The type of duty performed by SPARS in 1945 continued along the same lines as in former years, with women reservists serving as yeomen, communicators, instructors, clerks, radio operators, pharmacist's mates, storekeepers, hospital apprentices, ship's cooks, office and barracks administrators. Volunteers continued to be sent to Hawaii and Alaska, but the majority were on duty in the continental U.S. at coast guard headquarters in Washington, D.C., district coast guard offices, air stations, cap-

A U.S. COAST GUARDSMAN hacks away at the ice encrusting a buoy as a crewmember pelts it with a stream of boiling water. Tenders patrol navigation channels to keep them open and safe for traffic

INVASION SUPPLIES pouring onto a freshly won beachhead at Iwo Jima a few hours after advance landings by U.S. marines, Feb. 1945. Landing craft were manned by the U.S. coast guard

tain of the port offices, communications centres, separation centres, training stations and merchant marine hearing units.

SPARS receive ratings and ranks up to captain, inclusive, corresponding to those held by men in the service and at the same pay, and are entitled to the benefits of the Servicemen's Readjustment act. (D. C. SN.)

**Cobalt.** Though no figures were published on cobalt production in the United States in 1944, it was reported to have increased, although demand lessened and shipments declined. All told, 2,445 short tons of cobalt content were treated by refiners and processors, of which 89% went to metal and 11% into salts and driers. Belgian Congo is the main source of supply for imports which dropped from 2,467 tons of metal content in 1943 to 2,015 tons in 1944. Conditions improved in 1945, with 2,526 tons of metal content in imports and 2,334 tons treated by refiners and processors in the first three quarters of the year.

The metal content of the ore output of Belgian Congo was 2,178 short tons in 1943 and 1,868 tons in 1944. In Canada output dropped from 397 tons in 1940 to 18 tons in 1944. Rhodesia is the only other country with an appreciable output, but for this and a dozen other minor producers no figures were published. (G. A. Ro.)

**Cochin-China:** see FRENCH COLONIAL EMPIRE.

**Cocoa** (CACAO). The production of cocoa in Brazil and West Africa was restricted by shipping shortage during World War II and trade had not revived by the end of 1945. Prices were not adjusted to stimulate trade but the strong demand was expected to attract larger imports to the United States in 1946. Stocks were low but supplies available in the producing areas were said to be large. Imports of cocoa and cocoa beans averaged about 600,000,000 lb. in 1935-39, dropped to 239,600,000 lb. in 1942 and recovered to 682,308,000 lb. in 1944. The total for 1945 was expected to be equal that of 1944. (J. C. Ms.)

**Coco-Nuts** (COPRA). The end of the war in the Pacific opened the trade in copra, coco-nut oil and their products. Shipping had not improved sufficiently, however, to bring in any considerable amount of these products from the orient in 1945. South and Central America supplied most of the United States imports. Mexico had a production of 40,000 tons in 1945 and the British West Indies had an output of about 12,000 tons. United States imports of copra dropped to 189,620,000 lb. in 1944 from a former total of about three times this quantity or about 530,000,000 lb. Tropical America had increased its trade in fresh coco-nuts to the United States to 43,000,000 nuts in 1943. (J. C. Ms.)

**Coffee.** The consumption of coffee increased during World War II and by 1944 total imports reached 19,713,000 bags of 132 lb. each, compared with 14,777,000 bags imported

in 1939. United States per capita consumption increased from 13.7 lb. of green coffee in 1934-38 to 18 lb. in 1944 including the armed forces. Nearly all of the coffee used in the U.S. during World War II came from South America due to shipping shortages. World coffee production declined steadily during the war from an average of 38,600,000 bags 1935-40 to 24,464,000 bags in the year 1944-45. The principal decline was in Brazil where production dropped from the prewar average of 23,000,000 bags for 1935-40 to 9,500,000 bags in 1944-45. Available supplies from Java and India were greatly reduced. At the same time there was an increased output in Africa from 2,340,000 bags to 3,090,000 bags. The price of raw green coffee was established by the Office of Price Administration following Dec. 1941 and continued in effect through 1945. Prices of all grades increased during the war to the ceilings.

Under the Brazilian government control a tax was placed on new plantings and an export tax was applied to buy surplus coffee to be destroyed to support the market. From 1931 to 1943 the government bought a part of each grower's crop for destruction. From 1931 to July 31, 1944, a total of more than 78,000,000 bags was destroyed. After 1942 destruction was limited to coffee unfit for consumption or of low quality. The climate was unfavourable to coffee production, especially in Brazil but production was expected to increase in the near future and large surpluses and lower prices follow. New industrial uses were developed that might help to solve the coffee surplus problem. World production was more than equal to consumption needs, however, and there was abundant opportunity to expand the coffee-crop area. Brazil alone had areas that could be used to expand its production more than 20 times. Coffee production was not limited by natural conditions but by the world's capacity to use it at a price which was profitable to growers. (See also BRAZIL; GUATEMALA; PRICE ADMINISTRATION, OFFICE OF.) (J. C. Ms.)

**Coinage.** The United States mint, an adjunct of the treasury department, was established by act of congress April 2, 1792, and was located in Philadelphia, Pa. The service as constituted in 1945 consisted of mints in Philadelphia, Denver, Colo. and San Francisco, Calif.; the U.S. depository (for gold) at Fort Knox, Ky., and the U.S. depository (for silver) at West Point, N.Y., and U.S. assay offices at New York city and Seattle, Wash. The administrative offices are in Washington, D.C., from where the entire service is administered by the director of the mint.

Not only do the mints make all coins for the U.S., but they also produce large amounts for many foreign governments lacking minting facilities of their own. The mint service is charged with safeguarding of the government's huge values in gold and silver, running into billions of dollars. All medals for the navy, coast guard and marines are made in the mint at Philadelphia, and many for the army; also historic medals and special medals authorized by congress.

From the opening of the mint in 1792 through the calendar year 1945, 31,000,000,000 coins (in round numbers) were produced; of this amount, 26,500,000,000 were domestic and 4,500,000,000 were manufactured for foreign governments.

During the calendar year 1945, 3,862,980,299 coins were made, of which 2,060,695,501 were for U.S. domestic use, and 1,802,284,798 were for other countries. Domestic coinage by denominations follows:

	Pieces
Half dollars .....	51,624,800
Quarter dollars .....	103,717,601
Dimes .....	241,295,000
Five-cent pieces .....	215,505,100
One-cent pieces .....	1,448,553,000

Coinage of the wartime five-cent piece, of silver, copper and

manganese, was discontinued at the end of 1945, and the mint was authorized to return to the former alloy of 25% nickel and 75% copper.

The design of the dime was also changed at the end of the year, the "winged liberty head" coin being superseded by the new Roosevelt dime issued early in 1946. However, the liberty head dime was to continue in circulation. (N. T. R.)

**Coke.** The salient data on the production of by-product and beehive coke in the United States during the war years are given in the following table.

Coke Production in U.S., 1940-45

	(In thousands of short tons)				
	1940	1941	1942	1943	1944
Production .....	57,072	65,187	70,569	71,676	74,038
By-product .....	54,014	58,482	62,295	63,743	67,065
Beehive .....	3,058	6,704	8,274	7,933	6,973
Breeze made .....	4,165	4,555	4,752	4,941	5,116
Coal charged .....	81,386	93,138	100,850	102,460	105,296
Consumption, total .....	57,026	64,944	70,107	71,407	72,971
By iron furnaces .....	41,839	49,470	54,695	56,701	57,072

As is shown by the above figures, the chief cause of the greater demand for coke was the need for more iron and steel. Following a consistent increase in the earlier years, production began to lag early in 1945, but did not drop heavily even after the close of World War II. During the first 10 months of 1945 output totalled 56,075,742 tons (51,643,763 tons of by-product and 4,431,979 tons of beehive), against 62,004,700 tons in the same period of 1944.

In Canada production of coke rose from 3,548,700 short tons in 1943 to 4,001,560 tons in 1944 and declined to 2,956,000 tons in the first three quarters of 1945, against 3,011,000 tons in the same period of 1944. Coke production in Germany (including the Saar) was reported at 59,000,000 short tons in the fiscal year ending March 31, 1944, against 51,000,000 tons in the corresponding period in 1940. (G. A. Ro.)

**Cold, Common.** An analysis of colds in workers in several large industrial plants showed that there is a definite pattern to the frequency of colds with the highest peak in December and a lesser peak in October. July is the month of lowest incidence. Sudden drops in temperature are followed by an increase in number and severity of colds, which is greater among office workers than factory workers and also greater among women than among men. With increasing age the frequency of colds has a tendency to decrease but the severity to increase. Fewer colds are found in air-conditioned plants; the number of colds is highest in draughty places. More colds start on Monday than any other day of the week. Both the incidence and severity of colds are least among those whose work requires walking about most of the time. Another study of 1,600 girls of college age showed that a sharp increase in the number of new colds per day occurs during periods of falling temperature accompanied by heavy rain. These increases are most definite in girls who have had four or more colds for the year. There is a slightly increased tendency to acquire a cold in the small group accustomed to the use of cigarettes, but most of the smoking is done in smoking rooms which encourages crowding and hence the possible spread of the colds by droplet infection.

It has been stated that ascorbic acid (vitamin C) has some value in the prevention of colds. One extensive study of this subject came from Sweden; conscripts in the north of Sweden were given tablets, half of them receiving strong doses of vitamin C and the other half inactive tablets. No difference could be found in the frequency or duration of colds, degrees of fever or other signs of the common cold. The other studies on this subject have been equivocal. Several of the sulfonamide prep-

arations have been employed in an attempt to cut down the number of colds and other respiratory infections. In one study of 128 children, half of whom were given sulfadiazine by mouth continuously, a difference between the group receiving the drug and that not receiving the drug could not be shown. Attempts have been made to disinfect the air, especially of public places so that the common cold should not be so readily transmitted. Glycol vapours were employed in a home for convalescent patients with the result that the total rate of incidence of upper respiratory infections among patients whose air supply was disinfected by glycol vapour decreased greatly.

The treatment of the common cold has not made much progress. It is the consensus that neither the sulfonamides nor penicillin are of value in ordinary colds or influenza. There are persons who tend to develop complications from even the simplest cold and some of these can be helped by the use of the sulfa preparations or penicillin. The use of aerosol penicillin, in which penicillin is given by inhalation, appears promising as a means of combating some of the complications of the common cold.

**Colleges and Universities:** see UNIVERSITIES AND COLLEGES.

**Colombia.** A republic situated in northwestern South America at the juncture of the Isthmus of Panama with the continent. It is the only South American country with a littoral on both the Caribbean and the Pacific. Area: 438,825 sq.mi.; pop. (off. est. 1945) 10,701,816. Sixty-eight per cent of the population is classified as mixed blood, 20% as white, 7% as Indian, and 5% as Negro. Most of the inhabitants live in the highlands and mountain valleys of the interior. The capital is Bogotá, with a pop. est. in 1942 at 395,300. Other cities (1938 census) are Medellín (143,952), Barranquilla (150,395), Cali (88,366), Manizales (51,025), Cartagena (72,267), Ibagué (27,448), Cúcuta (37,323), Bucaramanga (41,714), Pasto (27,564), Santa Marta (25,113), Popayán (18,292). Language: Spanish; religion, Roman Catholic. Presidents in 1945: Alfonso López Pumarejo and Alberto Lleras Camargo.

**History.**—After having his proffered resignation refused on several occasions in the two preceding years, President López finally succeeded in leaving his office effective Aug. 7, 1945. Former Foreign Minister Alberto Lleras Camargo, also a member of the Liberal party, succeeded to the post through election by the senate as presidential designate on July 22. It was decided that he would only fill out the term of his predecessor; late in August he asked congress to reject a proposal to extend his time in office a full four years.

Much political attention was directed throughout the year to the coming national election, which was scheduled for May 1946. Several candidates appeared for the nomination of the majority Liberal party, the most important being Gabriel Turbay, former ambassador to the United States; Dario Echandía, former foreign minister and on occasion acting president; and ex-labour minister Jorge Eliecer Gaitan. The Liberal party met in convention on July 22, and Turbay received a majority endorsement. Followers of Echandía withdrew from the convention and challenged its legality, but on Aug. 4 Echandía declared he was no longer a candidate. The ever-present danger

of a split in the party continued, however, since in September backers of Jorge Eliecer Gaitan launched his candidacy as an independent. In December the Confederation of Colombian Workers resolved to seek the withdrawal of all candidates in order to facilitate the selection of one who would further liberal and democratic unity.

The year was marked by a number of cabinet reorganizations. In late March an attempt was made to work out a coalition ministry by naming three Conservatives to vacant portfolios, but the nominees refused to assume these posts. President Lleras Camargo presented a plan for executive reorganization in early September, recommending the elimination of the ministries of communication and of mines and petroleum, and the creation of six new administrative departments. When his cabinet was completed shortly afterward, two Conservatives accepted portfolios to make it the first bi-partisan cabinet after 1934.

Congressional elections held in March returned the Liberal majority of about 2-to-1 over the opposing Conservatives; the Social Democrat (formerly Communist) party increased the number of its seats from one to five. The Liberal Party also retained a heavy majority in the departmental and municipal elections in the fall.

Congress met in special session in January to consider social welfare and labour legislation, a proposed 5-year agricultural plan, and revision of existing petroleum legislation. With the exception of the latter item these measures in general were approved. President López approved the agricultural plan in April. A senate resolution of Feb. 16, 1945, clarified technicalities in regard to the Colombian war status against the axis powers. A second special session of the legislature set for early May was postponed until June 4 and again until June 25, so that it could take up measures proposed at the San Francisco conference. A state of siege carried over from 1944 was lifted Feb. 22; local disturbances in June caused it to be reimposed for a month in Bogotá only. In March some excitement was caused when the government announced that a supply of bombs had been discovered in certain churches of the capital.

The ending of World War II in August resulted in the elimination of censorship controls and the Office of Price Control was also abolished. Assets of 19 firms owned by axis nationals were expropriated in the same month and the chamber of deputies approved a bill authorizing use of such funds to meet war indemnity and reparations requirements. The United Nations charter was approved in October. There was much adverse comment by Colombian coffee-growers in the latter half of the year upon the refusal of the United States to abandon the OPA ceiling set on coffee, the Colombians backing the general Latin American claim that the ceiling had been set when costs were far lower. A minimum price was finally set in Colombia that was above the United States maximum with the result that sales practically ceased. As the war drew to a close, and shipping conditions eased, purchases of foreign exchange boomed. The balance of international payments was adverse to Colombia for the first six months of 1945, and by July the government had found it advisable to set up a new system of import control. In later months the balance changed, but on Oct. 31 it was favourable only slightly in excess of \$8,000,000 where it had been \$48,000,000 in 1944 on the same date.

Figures released by the United States government disclosed that Colombia had received lend-lease military goods during the period March 1, 1941-July 1, 1945, amounting to \$5,285,000 in value.

**Education.**—In 1941 there were 19,901 primary schools with an enrolment of 685,317, and 776 intermediate schools with an

enrolment of 58,980. Eight universities served 3,713 students. In the budget for 1946 prepared in Aug. 1945, 13,058,000 pesos were allocated to education.

**Finance.**—The monetary unit of Colombia is the peso, with an official value in Sept. 1945 of 56.98 cents U.S. The 1946 budget proposed in the summer totalled 174,000,000 pesos; the 1945 budget, originally approved at 172,000,000 pesos, had been increased by Sept. 30 to 202,000,000 pesos. Revenues for the first nine months of 1945 were reported at about 95,000,000 pesos (for the same period in 1944: approx. 65,000,000). The fiscal deficit on Sept. 30 was estimated at about 16,500,000 pesos. Gold bullion holdings by the Bank of the Republic on June 30 amounted to 178,000,000 pesos; bank notes in circulation on that date were valued at 179,000,000 pesos. The total national debt on Aug. 31 amounted to 360,379,113 pesos at official exchange rates; 209,810,550 pesos was internal debt and 150,568,563 was owed externally.

**Trade.**—Imports for 1944 amounted to 353,177 metric tons in quantity, exports to 2,988,499 metric tons. In 1943 they had amounted to 228,804 tons and 1,912,145 tons, respectively. Import licences granted up to Oct. 31, 1945, totalled \$214,000,000 (for same period, 1944: \$172,000,000). Export licences for the same period totalled \$98,000,000. Coffee exports for the quota year Oct. 1, 1944, to Sept. 30, 1945, amounted to 5,185,517 sacks of 132 lb. each, an excess over the preceding year of 358,000 sacks. Petroleum exports for 1944 amounted to 18,561,000 bbl. (1943: 10,617,000 bbl.).

**Communication.**—Railway mileage was estimated at 2,046 mi. in 1945; there were some 7,700 mi. of improved highway and 35,000 mi. of unimproved. Heavy expenditures on both railroad and highway construction were planned for the following few years, with the appropriation for 1945 amounting to 7,120,000 pesos. In 1943 motor trucks, automobiles, and buses registered numbered 32,042. Some seven air lines served the country in 1945; Avianca Airways was nationalized in September. A nationally owned navigation company started operations on the country's rivers early in 1945.

**Agriculture.**—The basic industry of Colombia is agriculture, with coffee the main crop. Refined sugar production for the first half of 1945 amounted to 43,692 short tons, about the same as in 1944. Wheat production for 1944 was estimated at approximately 100,000 metric tons; barley, 13,175 tons; rice, 121,000 tons; yucca, 1,054,000 tons; plantains, 714,000 tons; corn, 650,000 tons; potatoes, 418,000 tons. During the first half of 1945, 712,888 kilograms of cinchona were exported. There were estimated to be 12,334,000 cattle in the country.

The 5-year agricultural plan approved in April 1945 called for an expenditure of from 7,000,000 to 9,000,000 pesos annually to increase quantity and quality of crops by various means.

**Mineral Production.**—Petroleum output in 1944 was estimated at 22,648,000 bbl. (1943: 13,396,000 bbl.). Gold production amounted to 251,238 troy oz. for the first five months of 1945 (for the same period in 1943: 250,644 troy oz.). Platinum production for 1944 amounted to 34,304 troy oz. (1943: 34,564 troy oz.). Cement output was 273,694 metric tons; salt, 133,453 metric tons.

**Colorado.** A Rocky mountain state of the United States, in the west-central part; mean elevation above sea level, 6,800 ft. Admitted to the union in 1876 as the 38th state and known as the "Centennial state." Area 104,247 sq.mi., including 280 sq.mi. of water surface. Pop. (1940) 1,123,296; 52.6%

urban, 47.4% rural; 93.6% native, 6.4% foreign-born; white 98.5%; Negro 1.1%; other .4%; 102.6 males per 100 females. The 1940 census reported 2,734 Japanese, the largest in number of all races other than whites and Negroes. On July 1, 1944, the bureau of census estimated the civilian population at 1,147,259. In Oct. 1944 Japanese population enumerated 7,986 and later estimates 9,486. Approximately 900 Japanese had returned to the Pacific coast after the close of World War II. Capital and largest city, Denver (1940 census, 322,412; 1945 estimate, 392,412); other cities: Pueblo (52,162); Colorado Springs (36,789); Greeley (15,995).

**History.**—John C. Vivian (R.) was governor in 1945. Other officers were: lieutenant governor, William E. Higby (R.); secretary of state, Walter F. Morrison (R.); auditor of state, Leon F. Lavington (R.); treasurer, Homer F. Bedford (D.); attorney general, Lawrence Hinkley (R.); superintendent of public instruction, Inez Johnson Lewis (D.). The 35th general assembly repealed the state service tax and enacted a local government budget law, an occupational disease law, created a state institutional board and a fund of \$100,000 for industrial research development. A special session was called on Nov. 19 and adjourned Dec. 3. Legislation was passed authorizing the state planning commission to rehabilitate three of the state institutions, two charitable and one correctional; creating a state aeronautics commission; and appropriating highway money to meet federal aid.

**Education.**—The school census for 1943-44 was 296,901; number of elementary schools 1,986, enrolment 138,012; number of high schools 327, enrolment 44,594; number of teachers including superintendents, principals and supervisors 8,710; average salaries \$1,597.52; total expenditures \$24,622,806.81, including capital outlay and debt service. War emergency certificates issued, approximately 2,000.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Public welfare disbursements in 1944 amounted to \$27,085,789.85; pensions, 40,787 persons over 60, \$20,236,244.35; dependent children 9,041, \$1,472,763.85; blind 503, \$239,684.97; administration \$1,073,091.16. Federal share of the above programs totalled \$10,851,944.06. General assistance was \$3,726,345.41. Additional expenditures included tuberculosis assistance, \$199,492.49, to approximately 287 patients; miscellaneous services including child care, burials, distribution of surplus commodities, etc., \$138,167.62. For the fiscal period 1944-45 the four correctional institutions enumerated 1,512 inmates with disbursements totalling \$1,083,072.59. The six charitable institutions enumerated 5,520 inmates with disbursements totalling \$2,602,091.24.

**Communications.**—The state highway system in 1945, including 3,891 mi. of federal aid primary and 1,982 mi. of federal aid secondary roads, totalled 12,399 mi.; city streets 3,491 mi.; county roads 36,176 mi.; other local roads 26,423 mi.; national forests 788 mi.; toll 8 mi.; total 79,285 mi. There were 24 railroads operating with 3,883 mi. of main line track; 56 designated airports and landing fields, and 4 army air fields; 273,879 telephones in use.

**Banking and Finance.**—As of Dec. 31, 1944, there were 77 national banks and 63 state banks. Total deposits, \$843,090,223.96; total assets, \$889,517,127.67. The 23 federal and 29 state savings, building and loan associations showed total assets of \$46,586,716 as of Jan. 1, 1945. The state's finances continued to be in excellent condition due to increased revenue and strict economy in governmental operation. The state property tax was reduced from 3.64 mills in 1944 to 3.5 mills in 1945. Surplus in the state treasury as of Dec. 1, 1945, was \$12,385,000. The special session of the legislature appropriated from this fund \$3,500,000 for highway purposes, \$37,500 for a division of

aeronautics, \$990,000 for the rehabilitation of the Industrial School for Boys and two institutions for mental defectives, \$22,365 for the expenses of the legislature. The state institutional building fund was in excess of \$3,585,321 for postwar building. State budget, 1945-46, \$111,786,000 which includes federal aid. General obligation debt, \$1,180,000, highway anticipation warrants, \$15,435. Indebtedness of counties, school districts and municipalities, \$61,814,921.

**Agriculture.**—The year 1945, which marked the fourth year in which the Colorado agricultural industry operated under war conditions and in relation to war demands, was one of outstanding production. Acreage of all principal crops harvested in 1945 totalled 5,948,000 as compared with 5,900,000 ac. harvested in 1944. The wheat production was the largest in the history of the state.

Table I.—Leading Agricultural Products of Colorado

Crop	Unit	1945	
		1945 (est.)	Value
Wheat . . . . .	bu.	34,627,000	\$48,105,000
Corn . . . . .	"	16,588,000	19,408,000
Barley . . . . .	"	19,551,000	18,182,000
Oats . . . . .	"	7,245,000	4,637,000
Dry beans . . . . .	100 lb. bags	1,909,000	9,977,000
Sugar beets . . . . .	tons	1,836,000	...
Timothy hay . . . . .	tons	1,818,000	27,452,000
Potatoes . . . . .	bu.	19,110,000	21,976,000
All sorghums (grain) . . . . .	"	2,759,000	3,173,000
Peaches . . . . .	"	2,372,000	5,100,000
Apples . . . . .	"	1,275,000	3,634,000

The number of each species of livestock on Colorado farms and ranches was smaller on Jan. 1, 1945, than on Jan. 1, 1944. The aggregate value of all species combined totalled \$162,109,000 on Jan. 1, 1945, compared with \$176,597,000 on Jan. 1, 1944. The decline was largely due to the limited supply of feed grains and relatively high feed prices in relation to livestock prices.

**Manufacturing.**—Total value of products manufactured in 1939 was \$221,642,666 (census). Estimated value of succeeding years was: 1940, \$240,000,000; 1941, \$310,000,000; 1942, \$380,000,000; 1943, \$410,000,000; 1944, \$410,000,000; 1945, \$400,000,000. Persons employed in manufacturing in 1939 totalled 27,893 (census). Total estimated, including small firms was 33,344. Estimated monthly average of manufacturing employment in succeeding years was 1940, 33,493; 1941, 40,493; 1942, 58,642; 1943, 67,233; 1944, 55,150; 1945, 55,665. The wartime peak was in Oct. 1943, with 72,298.

**Mineral Production.**—Production of all minerals in 1944, exclusive of vanadium and tungsten, showed a decided drop. The vanadium and tungsten production was held confidential by

Table II.—Principal Mineral Products of Colorado  
1944 and 1943

Mineral	Value 1944	Value 1943
Gold . . . . .	\$ 3,900,925	\$ 4,814,530
Coal . . . . .	28,791,000	27,511,918
Silver . . . . .	1,599,168	1,894,501
Zinc . . . . .	9,109,740	9,524,304
Copper . . . . .	282,960	267,280
Petroleum . . . . .	3,380,000	2,620,000
Lead . . . . .	2,831,680	2,704,800
Molybdenum . . . . .	...	27,705,730
Fluorspar . . . . .	1,604,043	1,164,868

the federal government. The decrease in the value of mineral production was due to the shortage of labour in Colorado.

(A. Rt.)

**Colour Photography:** see MOTION PICTURES; PHOTOGRAPHY.

**Columbia, District of:** see WASHINGTON, D.C.

**Columbia University.** An institution of higher learning in New York city. The budget appropriation for 1944-45 was \$11,346,766.48. On Oct. 1, 1945, Dr. Nicholas Murray Butler, president from 1901, retired and

his duties were taken over by Acting President Frank D. Fackenthal. With the close of World War II came the revelation of Columbia's part in the production of the atomic bomb, the closing of the U.S. naval reserve midshipmen's school on the campus, the restoration to academic uses of various university buildings taken over by the government for dormitories and research and the return of numerous faculty members from government and military service. Applications for admission in 1945 were more numerous than at any previous time in Columbia's history. A Russian institute was established, and plans were perfected for an FM broadcasting station on the campus. (For statistics of enrolment, faculty members, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (M. H. T.)

**Columbium.** Production of columbium ores in the United States dropped from 5,771 lb. in 1943 to 3,208 lb. in 1944, while imports increased from 1,191 short tons to 1,842 tons, mainly from Nigeria. Increased supplies and decreased demand permitted relaxation of controls. The principal use is as an addition to stainless steels for improved corrosion resistance for parts to withstand high temperatures in aeroplane engines and rockets. (G. A. Ro.)

**Combined Chiefs of Staff, The.** The establishment of the combined chiefs of staff by the governments of the United States and Great Britain was announced on Feb. 6, 1942. The four United States members were known as the "Joint United States Chiefs of Staff" and consisted of the chief of staff to the commander in chief of the army and navy; the chief of staff, U.S. army; the chief of naval operations; and the commanding general, army air forces. The four British members were known as "Representatives of the British Chiefs of Staff." They consisted of the head of the British joint staff mission in Washington and representatives of the first lord of the admiralty, the chief of the imperial general staff and the chief of the air staff.

Supporting committees were established to combine and co-ordinate all the factors of military intelligence, transportation, munitions, staff planning, meteorology and communications. A combined secretariat was set up to perform the necessary secretarial work for the combined chiefs of staff.

The combined chiefs of staff were charged under the direction of the president of the United States and the prime minister of Great Britain with collaborating in the formation and execution of policies and plans concerning the strategical conduct of the war, the broad program of war requirements and allotment of munitions resources, and the requirements for overseas transportation for the fighting forces of the United Nations.

## Commission on a Just and Durable Peace.

The Commission on a Just and Durable Peace instituted by the Federal Council of the Churches of Christ in America continued its work on the churches' strategy for world order. In Jan. 1945, the commission convened at Cleveland a National Study conference which brought together nearly 500 leaders of 34

## 226 COMMITTEE FOR ECONOMIC DEVELOPMENT—COMMUNISM

communions. The conference analyzed moral, political and economic problems of the peace, and agreed upon nine specific recommendations for the improvement of the Dumbarton Oaks proposals, stating, "Christians must keep ultimate goals in view, but they have equal responsibility to work out attainable steps towards those goals and to support them."

The Cleveland recommendations were brought before the churches, the general public and the government. Copies of the statement were widely distributed for study and discussion. On Sunday, April 22, special prayers of intercession were offered in churches across the United States for the success of the San Francisco conference. During the conference, officers of the commission served as consultants for the federal council to the U.S. delegation, to reinforce the Cleveland recommendations and to inform the churches on conference developments. The United Nations charter adopted at San Francisco was judged by the commission to embody many of the recommended improvements. Prompt ratification of the charter was urged and Christians were called upon "to help create an invincible determination to use fully the procedures provided by the charter."

In line with this policy, the commission at its annual meeting in November set forth a general strategy for the postwar period, entitled, "Christian Action on Four Fronts for Peace." The four areas of emphasis for a continuing educational program were the Inner front, the Church front, the Peace Treaty front and the United Nations front. (Rt. M. F.)

### Committee for Economic Development.

This committee of U.S. businessmen was organized in 1942, as a private, nonpolitical, nonprofit organization, with the single purpose of encouraging realistic postwar planning. As such, its activities were guided by the recognition that planning toward a high level of postwar productive employment involved two major approaches: first, the making of bold positive plans by individual business employers to reconvert and expand after the war and thus provide new productive jobs; and second, the initiation of a program of research and recommendations designed to bring about a favourable national economic "climate" in which all individual postwar plans would have a chance to succeed.

The Committee for Economic Development, or C.E.D., functioned in 1945 under a board of 27 trustees. Paul G. Hoffman, president of the Studebaker corporation, was chairman and William Benton, vice-president of the University of Chicago, was vice-chairman.

The C.E.D. functions in terms of two major divisions:

The Field Development division, under the chairmanship of Walter Fuller, president of the Curtis Publishing company, is concerned with the first phase of encouraging planning as described above. This is done through the organization of community committees for economic development. At the end of 1945 there were approximately 3,000 communities covered by such committees throughout the United States, of which about 70,000 businessmen were members.

Meanwhile, the Research division was engaged on nearly 20 major studies of problems affecting national economic and business conditions. These were conducted by a research committee of businessmen, headed by Ralph E. Flanders, president of the Jones and Lamson Machine company. This committee was counselled by a research advisory board of economists and social scientists under the chairmanship of Dr. Sumner H. Slichter, Lamont professor of economics at Harvard.

During 1945 four of these studies were completed and published under the titles of: *Demobilization of Wartime Economic Controls*, by J. M. Clark, professor of economics, Columbia

university, New York city; *Providing for Unemployed Workers During the Postwar Transition Period*, by Richard A. Lester, associate professor of economics, Duke university, Durham, N. C.; *International Trade and Domestic Employment*, by Calvin B. Hoover, dean of the graduate school of arts and sciences, Duke university, Durham, N. C.; *Agriculture in an Unstable Economy*, by Theodore W. Schultz, professor of agricultural economics, University of Chicago, Chicago, Ill.

After each of the above research projects was completed and all other available facts on the subjects were examined, the research committee issued statements of national policy setting forth the committee's conclusions and recommendations for public action on these same problems. In addition, an over-all policy statement, dealing with economic and social accomplishments of the research program as a whole, was issued under the title, *Towards More Jobs and More Freedom*.

By the end of the Japanese war, the C.E.D. program had been in operation nearly three years. Results achieved, both in terms of encouraging individual businessmen to plan for bold postwar expansion and in terms of progress in the study of economic problems confronting the country as it entered the reconversion period, were ample, in the opinion of C.E.D.'s trustees, to justify their original belief that private enterprise would and could meet its postwar responsibilities and opportunities. In this regard, the C.E.D. trustees' report for 1945 underscored the fact that by acting boldly on their advance planning, U.S. businessmen could achieve records of high level productive employment never before reached in peacetime.

C.E.D. goals for such an expansion were stated as: a 30% to 45% expansion of business activity; and the creation of 7,000,000 to 10,000,000 new peacetime jobs over and above 1940 levels.

The national office of the C.E.D. is located at 285 Madison Ave., New York city. Its activities are supported by contributions from businessmen throughout the country. (P. G. H.)

**Communism,** or revolutionary Marxism, is a system of government evolved under the leadership of Lenin and Stalin in the soviet union, the former Russian empire. Originally intended as the starting point for a socialist world revolution, the movement after 1934 took a different development in Russia. It presents an amalgam of Lenin's communism with the historical traditions and aspirations of the Russian empire. Communism has proved the new form in which these aspirations have organized the masses of the empire to active participation. In that respect the former antireligious policy with its "godless" propaganda and its transformation of churches into antireligious museums combatting the "opium for the people," was changed to a policy of active co-operation of the Orthodox Church with the Russian state.

At the beginning of Feb. 1945 Alexei, former metropolitan of Novgorod and Leningrad, was crowned Russian patriarch. Under his leadership the church collaborated closely with the Russian government and with the government Council for Orthodox Church Affairs whose chairman was George Karpov, a high communist official. All churches were ordered to offer prayers "for the health and well-being of the God-sent leader of the peoples of our Christ-loving nation." All Orthodox churches

ARGENTINE COMMUNISTS at a huge rally in Buenos Aires during 1945, following removal of the ban outlawing the party

everywhere were to be united under the leadership of Moscow. The patriarch himself, at whose coronation the patriarchs of Alexandria, Antioch and Georgia participated, visited the near east—Damascus, Jerusalem and Alexandria—to renew the ties which had existed in the time of tsarist Russia. Orthodox churches which had split away from the Moscow patriarchate abroad were warned to re-enter. The metropolitan council of the Russian Orthodox Church in the U.S. refused to accept the conditions laid down by the patriarch for reunion, because they suggested “the high handed methods of an autocratic bureaucracy.” The Russian Orthodox Church in the U.S. was to continue as the U.S. church and therefore was obliged to reject the patriarch’s demand to express loyalty to the soviet government.

In conformity with the Pan-Slav propaganda of the Russian government, the Czechoslovak Roman Catholic Church conference at Wlehrad where St. Cyril and St. Methodius laboured in the 9th century to christianize the Slavs, looked toward ultimate union with the Russian Orthodox Church. The keynote address called on all Catholic theologians of Slav descent to join “the general eastward orientation of the country.”

In spite of the emphasis on the Russian past, which had been found most helpful during World War II, the Communist party in Russia called at the end of the war for a new devotion to the Marxist-Leninist doctrine. During the war the party which in 1940 counted about 3,500,000 members had grown to a membership of 5,800,000 by April 1945. Most of these new members came from the Red army not sufficiently prepared in Marxist theory, and the old party members had by necessity during the war neglected indoctrination. The war had at the same time resulted in a growing contact with the outside world and its ideas which made the development of “deviations” or “heresies” within the party possible.

This shift to a new emphasis on party ideology made itself felt also in the Communist party of the U.S. The April 1945 issue of *Cahiers de Communisme*, the official organ of the French Communist party, published an article by the party secretary, Jacques Duclos, against the “rightist” deviation of the U.S. communists under the leadership of Earl Browder. Browder, after Tehran, abandoned class war and came out for collaboration with progressive capitalism, forming a broad national unity in the U.S. The 7,600-word article with its bitter attacks upon Browder and the policy of the U.S. communists which was accused of having “swerved dangerously from the victorious Marxist-Leninist doctrine,” was reprinted in *The Daily Worker* by Browder, its editor, and became immediately the guiding principle of communist policy in the U.S., which made a sharp and abrupt turn back to class war. The Communist party was reconstructed, Browder was stripped of his authority and re-

placed by William Z. Foster as the new leader of the party. A special convention at the end of July endorsed unanimously the new leftward trend. The April issue of *Cahiers de Communisme* had declared: “Today as in the past the ultimate goal of the Communists is the same.”

The events of 1945 did not establish clearly whether communism was spreading outside Russia in Europe, though in many European countries communists formed part of the government coalitions and held important positions in the cabinets. While the governments of Rumania, Bulgaria and Yugoslavia were communist-controlled and no opposition to the governments in power was allowed, everywhere else where the freedom of the polls was secured, the communists could nowhere gain more than a fourth of the votes (France and Finland) and in many countries made a surprisingly weak showing (Great Britain, Austria and Hungary).

In Asia, however, the year 1945 seemed to see a growth of communist influence everywhere. Communist elements played an important role in the nationalist and agrarian movements in the Philippine Islands, in Indonesia, in Indo-China and in Burma. In China the powerful Communist party which controlled from Yenan large parts of China and maintained its own army, opposed the Chinese government which was led by Generalissimo Chiang Kai-shek and which was recognized by the United States, soviet Russia and all the other United Nations and was a charter member of the United Nations organization. The Chinese government objected to the existence of an armed faction in the country which threatened the nation with a civil war. Toward the end of 1945 Russian support cleared the way for the advance of Russian government troops into Manchuria, the control of which represented the most important bone of contention between the Chinese government and the Chinese communists after the liberation of the country from Japan.

An important advance in communist influence in the international labour movement was achieved with the formation of the new world trade union organization, called World Federation of Trade Unions, in Paris in the fall of 1945. The International Federation of Trade Unions, which had been founded in 1901 and reconstituted in 1919 with the seat in Amsterdam and which did not admit communist and Russian trade unions, was dissolved. Its place was taken by the new organization in which the Russian trade unions participated and where many other national trade unions showed a strong communist influence. President of the new organization was Sir Walter Citrine (Great Britain) while its general secretary was Louis Saillant, a French trade-unionist with communist leanings. Of the U.S. trade unions, the American Federation of Labor refused to join the new body, while the Congress of Industrial Organizations under Sidney Hillman took a very active part in its organization. (See

also DEMOCRACY; FASCISM; SOCIALISM; WORLD FEDERATION OF TRADE UNIONS.)

**Community Chest** is the name given to a local organization of citizens and social welfare agencies; also known as "community fund," or "welfare fund."

During World War II, the great majority of community chests extended their scope to become "community and war chests," as described above. Community Chests and Councils, Inc., the national association of chests and councils, was active in planning and directing this development and in helping to establish the National War Fund, Inc., a wartime campaign headquarters organization for all united campaigns for war relief services. This service extended to community and war chest campaigns as well as communities where no community chests existed. Community Chests and Councils, Inc., assisted in the organization and operation of the National War fund, through temporary loans of staff, participation in policy-forming and committee work, and co-operative publications and activities. Community Chests and Councils, Inc., instituted quota and budget procedures for national war relief agencies included in the National War fund and in 1943 transferred these functions to the latter organization.

Community Chests and Councils, Inc., was organized in Feb. 1918 as a national clearinghouse of ideas and services for community chests and councils of social agencies. Of the 1,142 community war chests and councils of social agencies in operation by the end of 1945 (820 chests and 322 councils), 784 chests and 303 councils were in continental United States, 4 chests and 2 councils in Hawaii, 29 chests and 17 councils in Canada, 2 chests in South Africa, and 1 chest in the Virgin Islands. Almost all large cities in the U.S. (except New York city which has a limited joint financing organization) had community chests or similar plans. More than 20,000,000 contributions, totalling \$221,272,950 were given to community and war chests to be used during 1945 for voluntary social work in their communities and for National War fund agencies.

Officers of Community Chests and Councils, Inc., for 1945 were: honorary president, Gerard Swope, New York city; president, E. A. Roberts, Philadelphia, Pa.; vice-presidents, J. B. Adoue, Jr., Dallas, Tex., H. L. R. Emmet, Erie, Pa., Mrs. DeForest Van Slyck, New York city, Harry P. Wareham, Rochester, N.Y.; treasurer, Milton H. Glover, Hartford, Conn.; secretary, Robert P. Lane, New York city. Ralph H. Blanchard was executive director. The address of the association was 155 East 44 St., New York 17, N.Y. (See also RELIEF.) (B. A.)

**Community Trusts.** The accumulation of \$67,041,684 in charitable trust funds was reported by 76 community foundations in the United States and Canada at the beginning of 1945. Their resources were \$45,000,000 in 1935 and \$13,500,000 in 1925. The New York Community trust administers 62 funds totalling \$15,871,000 and the Chicago Community trust stands at \$11,498,000, followed by the Cleveland foundation, \$8,624,000, and the Winnipeg foundation, \$3,561,000.

Philanthropic outpayments by these agencies in 1944 rose to \$1,918,000 from \$1,739,000 in 1943. The largest disbursements were in New York, \$558,746; Cleveland, \$279,000; Chicago, \$268,000; and Boston, \$256,000.

The largest receipts of funds by community trusts in 1944

occurred in New York, \$4,650,000; Los Angeles, \$723,000; Chicago, \$675,000; and Hartford, \$500,000.

Newly created community foundations became operative in Columbus, O., Spartanburg, S.C., and Champaign, Ill. The first appropriations of income were made during 1944 in Salem, Ore., and Duluth, Minn., while an initial gift of principal came in that year to the Syracuse (N.Y.) foundation.

Community trusts ordinarily place investment responsibility in trustee banks designated by contributors and lodge distributional power in a citizens' committee authorized, also by the donors, to adapt its disbursement policies to the evolving requirements of current social needs. This procedure is designed to avoid obsolescence and keep funds effectively employed through changing circumstances. (R. Hs.)

**Congregational Christian Churches.** The Congregational Christian Church of the United States represents a union (1931) of the Congregational Church, established 1620, and the Christian Churches, founded after the American Revolution. The churches numbered 5,875 in 1945, organized in 51 conferences, with a membership of 1,113,930. They are community institutions with no restrictions of race, creed or station, and each church elects its own minister and officers and writes its own covenant. During 1945, total contributions received for home expenses were \$17,467,525; for benevolences, \$3,350,910; 2,015 churches were rebuilt or repaired at a cost of \$3,122,188; total property value was \$116,755,319. National headquarters: 287 Fourth Ave., New York 10, N.Y. (See also CHURCH MEMBERSHIP.)

**Congress, United States.** The 79th U.S. congress met for its second session Jan. 14, 1946. It comprised the following members (as of Jan. 7, 1946):

#### United States Senate

Presiding Officer: Kenneth McKellar of Tennessee<sup>1</sup>  
Majority Leader: Alben W. Barkley, of Kentucky  
Minority Leader: Wallace H. White, Jr., of Maine

State	Name	Party	Term Expires	Residence
Ala.	Bankhead, John H., 2nd. . . . .	Dem.	1949	Jasper
	Hill, Lister. . . . .	Dem.	1951	Montgomery
Ariz.	McFarland, Ernest W. . . . .	Dem.	1947	Florence
	Hayden, Carl. . . . .	Dem.	1951	Phoenix

## Congress of Industrial Organizations.

In 1945 there were 6,000,000 members of the C.I.O. Thousands of C.I.O. members contributed their share to the creation of the bomb releasing atomic energy. Other hundreds of thousands produced the other materials needed in the war effort.

With the end of war production, millions of workers were thrown out of work. Sixty million peacetime jobs became the goal set for continuing national prosperity. Federal legislation supported by the C.I.O. to help bring about a decent standard of living for all groups included the Murray-Wagner Full Employment bill; an amendment to the Fair Labor Standards act, to establish a minimum wage of 65 cents an hour; the Kilgore-Forand Unemployment Compensation bill, to raise unemployment benefits; the Wagner-Murray-Dingell Social Security bill.

Higher wage rates throughout industry, and guaranteed annual wage plans wherever possible, were additional parts of the program to ensure full employment and production.

Fifty thousand dollars was contributed to Georgetown University Medical school in memory of Franklin D. Roosevelt.

The C.I.O. took an active part in founding the World Fed-

C.I.O. DELEGATES from N.Y. arriving at Washington, D.C., to support the Kilgore bill coming up for congressional vote. Recommended by Pres. Truman, the bill provided maximum unemployment benefits of \$25 weekly for 26 weeks

eration of Trade Unions, representing 70,000,000 working people everywhere, which came into being after successive conferences in London, Washington, San Francisco and Paris in order to unite the trade union movements of the world.

The circulation of the "Facts for Action" series of publications issued by the Department of Education and Research increased tremendously over previous years. This included pamphlets on re-employment, substandard wages, guaranteed annual wages, and special issues of the monthly *Economic Outlook*, on reconversion, women in industry, farmer-labour co-operation.

National headquarters were at 718 Jackson place, N.W. Washington 6, D.C. National officers were Philip Murray, president; James B. Carey, secretary-treasurer.

(See also AMERICAN FEDERATION OF LABOR; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES.) (P. MY.)

**Connecticut.** Popularly known as the "Nutmeg state," the "Land of Steady Habits" or the "Constitution state," Connecticut, one of the 13 original states, is next to the smallest of the New England states, its area being 5,009 sq.mi. including 110 water. The population (1940 census), was 1,709,242, and even increased slightly more than 2% during World War II, according to the census bureau. This unusual gain was made despite an enrolment of approximately 200,000 or 33% of the male working force in the state, serving in the armed forces. The capital and largest city is Hartford (166,267) followed by New Haven (160,605), Bridgeport (147,121), Waterbury (99,314), New Britain (68,685), and Stamford (47,938), all 1940 census figures.

**History.**—The political division of the general assembly which met Jan. 3, 1945, and adjourned June 6 resulted in a stormy session. The Republican governor and house were opposed by a Democratic senate. However, by compromise and otherwise, both sides managed to enact legislation to which they were pledged. The senate failed to approve several of the governor's appointments and only at the end of the year were those snarls being untangled by the state supreme court. Some of the measures enacted were: increase of the Soldiers', Sailors', and Marines' fund from \$2,500,000 to \$15,000,000, by increasing the cigarette tax from 2 cents to 3 cents per package; appropriation of \$750,000 for an armory at Bridgeport; appropriation of \$2,000,000 for state school building grants to towns, with a limit of \$50,000 in any one grant;

reduction from 52 to 48 hours in the maximum work week for women in certain industries; directing the Public Welfare council to make a study of juvenile delinquency; establishment of a three-man board to administer a labour relations act, advocated by organized labour for many years, guaranteeing the rights of collective bargaining to all Connecticut workers engaged in intrastate industries.

The elective state officers were: governor, Raymond E. Baldwin (Rep.); lieutenant governor, Wilbert Snow (Dem.); secretary of state, Charles J. Prestia (Dem.); treasurer, William T. Carroll (Dem.); comptroller, John M. Dowe (Dem.); attorney general, William C. Hadden (Rep.); United States senators, Thomas C. Hart (Rep.), term expires 1947; Brien McMahon (Dem.), term expires 1951.

**Education.**—In 1944-45, there were 791 public elementary schools with 5,111 teachers and 165,551 pupils; 36 junior high schools with 735 teachers and 17,726 pupils; 91 public high schools with 2,619 teachers and 60,225 pupils. The state also maintained 12 trade schools and 2 state-aided trade schools which had a total day and evening enrolment of 7,366 students and 214 teachers. There were 4 teachers colleges with 1,269 students and faculties of 123. At the state university there were 2,813 students and 294 on the faculty. The local expenditure for education was \$34,694,300, a large increase over the year before.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Total relief cases in June 1945 were 39,581 compared with 40,076 the previous June, but the cost in 1945 was \$1,250,688 as against \$1,207,440 the year before. The number of those receiving relief in the various categories were: general local relief 7,305; old-age assistance 13,878; in state institutions 6,224; county wards 3,345; state wards 1,708; the blind 180; all were reductions from 1944. However, aid was given to 7,140 dependent children, 636 more than the previous year.

**Communication.**—Total motor vehicle registration from March 1 to Dec. 20, 1945, was 533,116 as against 518,109 for the same period in 1944. Operators' licences issued during the same time were 625,102 compared with 589,242. These figures include free licences to 88,316 veterans in 1945 and to 47,788 in 1944. Contracts for new highway construction were let and work started. The construction of another toll bridge across the Connecticut river at Old Lyme was started at an estimated cost of not more than \$6,000,000.

There were 11 broadcasting stations in the state, one with 50,000 watts power. Three railway companies had 875 miles of track, one street railway company had 468 mi.; there were 177 telephone outlets, 47 bus companies, and 114 taxicab companies.

**Banking and Finance.**—The bank commissioner reported that as of Sept. 30, 1945, the assets of the 72 mutual savings banks were \$1,220,685,267; of the 63 state banks and trust companies, \$760,052,838. As of June 30, the assets of the 51 national banks were \$844,865,000. The 33 building and loan associations had assets of \$39,649,264. These figures were all large gains over 1944. The state treasurer gave the following summary of the state's finances as of the fiscal year ending June 30: cash balance July 1, 1944, \$35,181,054.57; cash receipts \$126,365,424.69; disbursements \$126,114,907.39; cash balance June 30, 1945, \$35,431,571.87.

The total bonded debt was \$23,600,000, of which \$13,200,000 was to be paid out of the bond retirement fund, which amounted to \$13,523,952, and \$10,400,000 self-liquidating bonds such as were issued to build toll bridges and dormitories at the state university. The Post-War Purposes fund was increased during 1945 by \$8,493,320, and amounted to \$12,925,736. The un-

employment compensation fund deposited with the United States treasury was \$169,300,652. The amount withdrawn during the year was \$1,575,000.

**Agriculture.**—Due to the failure of the tobacco crop, the agricultural (including livestock) income for 1944 was \$102,737,000, as compared with \$105,144,000 in 1943. The total for livestock and livestock products was \$67,221,000, practically the same as in 1943.

Leading Agricultural Products of Connecticut, 1944 and 1943

Crop	1944	1943
Tobacco . . . . .	\$5,489,000	\$18,033,000
Potatoes . . . . .	7,276,000	2,690,000
Truck crops . . . . .	5,749,000	6,094,000
Apples . . . . .	3,202,000	1,899,000

**Manufacturing.**—Cancellations of war contracts were very heavy after V-J day, since practically all plants were engaged in war work. The index of business activity which had reached a high of 227.2 in April 1943 dropped to 118.4 in Oct. 1945, as compared with 163.2 in Oct. 1944. Preliminary figures for November showed a slight recovery. Reconversion was anticipated in many industries (notably the typewriter industry) and was progressing rapidly. With a few exceptions, management and labour had settled their differences amicably.

**Mineral Production.**—With the cessation of hostilities, production of strategic minerals almost ceased. Stone and clay products continued to be of considerable importance.

## Conservative Party, Great Britain.

For the Conservative party, the general election immediately after the victory in Europe but before the end of World War II in Aug. 1945, meant the loss of the dominant position it had held in British politics after 1931. Of 554 Conservative candidates only 189 were elected to the enlarged house of commons of 640 members. Nine Conservative ministers of cabinet rank and 18 undersecretaries were defeated. So were the chairman (Ralph Assheton) and the vice-chairman (Col. H. Mitchell) of the party organization. Some of the ministers and Mr. Assheton were soon returned to the house in by-elections, arising from the changeover of government, and Winston Churchill, transferred to the opposition bench, was freed with remaining colleagues for the reorganization of party activity in the house and country. One of the first acts for the creation of a "united and virile opposition" was the setting up of a Conservative committee to keep liaison between the front and back benches. Mr. Churchill was chairman and other members, in addition to Mr. Assheton and the chief Conservative whip (James Stuart), were the chairmen of party committees dealing respectively with defense, service affairs, including demobilization and resettlement, civil aviation, social services and education, trade and industry; foreign affairs; imperial affairs, agriculture; home affairs and welfare; and town and country planning.

The first party conference held after 1943, and only the second during the war years when Conservatives suspended party operations, took place on March 14 and 15, 1945. At this meeting Churchill made his first entirely party speech after his election as leader in 1940. Officers elected at this conference were Sir George (later Lord) Courthope, as president of the National Union of Conservative associations; R. A. Butler,

M.P., chairman of the central council; Major R. G. Proby; Mrs. Hornyold-Strickland and Sir Herbert Williams, vice-chairmen; and Lord Derby and Lord Mildmay of Flete, trustees. Sir Robert Topping, who had been general director of the Conservative central office after 1927, was succeeded by Lieutenant Colonel Stephen H. Pierssené. G. E. Christ was press relations officer. The vice-chairman of the party organization was J. P. L. Thomas, M.P.

In a 12-point policy for peace, issued by the central office in May, essentially Conservative points were: insistence on the fullest opportunity for individual enterprise; the removal of wartime controls when their necessity ceased; development of export trade and agriculture; and a "determined policy for full employment with a rising standard of living." Conservative opposition was also reaffirmed to any repeal of the Trades Dispute Act of 1927.

The Tory Reform committee of younger Conservatives set up in 1943 had in 1945 Hugh Molson, M.P., as chairman and Major Everard Gates, M.P., as secretary. On Oct. 5, 200 Conservative candidates defeated at the election held a private conference convened by Ralph Assheton. At this a large number of Conservative suggestions were conveyed to Winston Churchill. On Nov. 28 Churchill rallied the party in an address to the central council of the organization at which it was resolved to reconstitute the postwar problems central committee and furnish it with all necessary secretariat for research. The outcome was the first debate on a censure motion against the government on Dec. 5 and 6 (see also PARLIAMENT). (L. Du.)

**Consumer Credit.** The gradual expansion of consumer credit in the U.S. which began early in 1944 continued throughout the year 1945. By the close of 1945 the total outstanding amount of consumer credit approximated \$6,300,000,000. This figure is to be compared with outstandings of roughly \$10,000,000,000 in Aug. 1941, which was the all-time peak, and with the low point of \$4,700,000,000 reached early in 1944 as the result of the discontinuance of production of goods customarily purchased on instalment credit terms and of restrictions imposed upon loans and credit sales by the federal reserve board through Regulation W.

All types of consumer credit shared in the expansion from the low point of 1944, although some types expanded more substantially than others. The principal increases occurred in charge account balances, in credits for services and in instalment loan balances. Among the agencies making instalment loans, commercial banks had by far the greatest increase in loan balances, with regulated small loan companies and industrial banking companies enjoying smaller rises in their outstandings. Insured loans for repair and remodernization of homes also expanded substantially. The outstanding amount of instalment sales credit, however, remained close to previous low levels.

The gradual expansion of consumer credit during 1945 was fully to be expected in view of the rise of incomes and prices, during a major part of the year, the relaxation of restrictions on production and consumption of certain consumers' goods, and the failure of the federal reserve board to tighten the restrictions of Regulation W. The substantial increases in repair and remodernization loans and in other instalment loans were due in part to the removal of restrictions on home remodernization and repair loans and the relaxation of restrictions on other loans which were not used to purchase consumers' durable goods. The negligible expansion of instalment sales credit reflected the delays in restoring large-scale production of automobiles, refrigerators, washing machines, radios, pianos and other consumers' durable goods which are commonly sold on time-payment terms.

After the cessation of hostilities in Europe, numerous competitive plans were developed to take advantage of the expansion of instalment financing that was anticipated when the assembly lines would begin to turn out large quantities of consumers' durable goods. The National Association of Insurance Agents, in the interest of capturing for its members a large share of insurance underwriting on new automobiles, offered a scheme that makes the local insurance agent a party to direct financing arrangements between the individual automobile purchaser and a bank. The Morris Plan Corporation of America organized a subsidiary, the American Instalment Credit corporation, to work with selected banks in purchasing automobile dealers' receivables. A group of large banks engaged in instalment financing sponsored the National Sales Finance plan, designed to establish a banking network to finance instalment sales contracts growing out of household appliance sales. While these new plans concerned banks primarily, the sales finance companies, which had formerly handled the bulk of the instalment financing business, were also planning the expansion of their services. It seemed clear that a period of intense competition in instalment sales financing lay immediately ahead.

The controversy over the continuation of federal government regulation of consumer credit became more heated during the year 1945. The Retail Credit Institute of America, whose membership is composed predominantly of merchants specializing in credit sales of furniture, clothing, jewellery and household appliances, petitioned President Truman to discontinue Regulation W. On the other hand, many prominent merchants, bankers and economists urged continuation of the federal reserve board's consumer credit regulations until a balance between demand and supply could be approximated in the consumers' durable goods field. Some business men and government officials urged that authority to regulate the terms of consumer credit contracts be extended by legislation as an instrument for maintaining peacetime economic stability. In Canada, also, there was a strong movement, supported by social agencies and part of the business community to continue the wartime regulation of consumer credit through dominion or provincial legislation.

In California, the state legislature enacted an instalment sales act which requires the seller to provide the buyer with a copy of the sales contract and of the insurance policy if a charge is made for insurance. The sales contract must state the cash price, the down payment, the charges for insurance or for recording fees, if any, the unpaid balance of the cash price, the time-price differential, the balance payable and the terms of payment. The act also limits the amount of the finance charge.

There were no significant changes during the year in state legislation regulating small loans and pawnbroking. (R. Nr.)

**Contract Bridge.** The end of World War II, and the total lack of change in rules or systems, gave new stimulus to this premier card game, returning experienced players to the bridge table and to the duplicate matches and tournaments that became so popular after contract replaced auction in the late 1920s.

Even the bidding fads such as the "powerhouse no trump" and other short-lived experiments that created confusion in earlier years were notably absent in 1945, with a corresponding country-wide standardization that greatly improved the so-called casual partnerships. The average calibre of skill rose steadily year by year; whereas in 1935 there were only about 1,000 experts in the entire United States, ten years later, in 1945, this number had grown to at least 50,000.

The results of the major tournaments of 1945 were:

**Masters' Individual Championship.**—Won by Charles H. Goren, Philadelphia, Pa.

**Vanderbilt Tournament.**—(National Knockout Team-of-Four champion-

ship): won by Mrs. Helen Sobel, B. J. Becker, New York, N.Y., Charles Goren and Sidney Silodor, Philadelphia, Pa.

**Summer National Tournament.**—**Masters' Pairs:** won by M. A. Lightman, Memphis, Tenn., Robert Appleyard, Forest Hills, N.Y. **Masters' Teams-of-Four:** won by Oswald Jacoby, Dallas, Texas, T. A. Lightner, Sam Fry, Jr., Howard Schenken and Edward Hymes, Jr., New York, N.Y. **Men's Pairs:** won by Lee Hazen and Sylvester Gintell, New York, N.Y. **Women's Pairs:** won by Mrs. Olive A. Peterson and Mrs. B. M. Golder, Philadelphia, Pa. **Mixed Teams-of-Four:** won by Miss Ruth Sherman, Waldemar von Zedtwitz, New York, N.Y., Mrs. W. Wagar, Atlanta, Ga. and John Crawford, Philadelphia, Pa. **President's Cup Pairs:** won by Sigmund Freisinger, Cliffside Park, N.J. and Mrs. Peggy Adams, New York, N.Y. **Non-Masters' Teams-of-Four:** won by Ernst Theimer, E. Orange, N.J., L. A. Doyle, Montclair, N.J., Lee Sagar, E. Orange, N.J. and D. F. Geortner, S. Orange, N.J.

**Winter National Tournament.**—**Open Pairs:** won by Mr. and Mrs. L. J. Jaeger, New York, N.Y. **Open Teams-of-Four:** won by Lee Hazen, Waldemar von Zedtwitz, George Rapee and Sam Stayman, New York, N.Y. **Women's Teams-of-Four:** won by Mrs. Helen Sobel, New York, N.Y. **Mrs. R. C. Young, Bywood, Pa., Mrs. J. E. Folline, Richmond, Va. and Mrs. W. Wagar, Atlanta, Ga. Mixed Pairs:** won by Mrs. W. Wagar, Atlanta, Ga. and John Crawford, Philadelphia, Pa. **Non-Masters' Pairs:** won by C. Jack Bonney, Long Island city, N.Y. and Bernard Lampert, New York, N.Y. (E. CUL.)

**Contract Renegotiation:** see BUSINESS REVIEW.

**Contract Settlement, Office of:** see LAW; WAR MOBILIZATION AND RECONVERSION, OFFICE OF.

**Contract Terminations.** By Nov. 30, 1945, in the United States, 301,000 war contracts had been terminated for the convenience of the government from the beginning of war production. These involved a cancelled commitment value of \$63,500,000,000. On that date, 234,000 terminated contracts with a cancelled commitment value of \$28,700,000,000 had been settled.

The termination of World War II contracts for the convenience of the government started early in the war production program. Before the cessation of hostilities, the main reasons for contract terminations were the changing needs of global war and the rapid technical improvement made in weapons and equipment.

Of the \$63,500,000,000 of cancelled commitments, war department terminations amounted to \$44,900,000,000, navy department \$15,800,000,000 and other agencies \$2,800,000,000. As of Nov. 30, 1945, \$21,400,000,000 of these cancelled commitments had been settled by the war department, \$6,200,000,000 by the navy department and \$1,100,000,000 by other agencies.

As contract terminations grew in volume even early in the war, the need for settlement procedures for such contracts became apparent. At first the contracting agencies of the government, principally the war and navy departments, the Maritime commission, the Treasury department, and the Reconstruction Finance corporation and its subsidiaries, developed their own procedures. However, the need for uniform methods soon made itself felt, and the Joint Contract Termination board, under the Office of War Mobilization and Reconversion, was established by the principal contracting agencies. The basis of unified action to settle terminated contracts was elaborated in the *Report on War and Post-War Adjustment Policies* published by Bernard M. Baruch and John M. Hancock, who had been appointed as the advisory unit for war and postwar adjustment policies of the Office of War Mobilization and Reconversion. This report stressed the need for speed in the settlement of war contracts and for fairness to the contractor and to the government.

Subsequently, action by various congressional committees led to the passage of the Contract Settlement act of 1944, public law 395, 78th congress. The act, which became effective on July 21, 1944, established the Office of Contract Settlement as the policy-making agency to prescribe policies, principles, methods, procedures and standards for the contracting agencies. Subject to the supervision of the Office of Contract Settlement, the contracting agencies are responsible for carrying out the act's objec-

tives. Except for appeals, all contract settlement operations are carried out by the contracting agencies.

Robert H. Hinckley, a vice president of the Sperry corporation, New York, and former assistant secretary of commerce for air, was appointed director of contract settlement and assumed his duties on July 28, 1944.

The Office of Contract Settlement issued 20 regulations dealing with such matters as interim financing, plant clearance, pre-termination agreements, standard settlement proposal forms, retention of records, accounting practices and other subjects. The issuance of these regulations as provided for by the legislation facilitated the prompt settlement of terminated war contracts. The office established an Appeal board. By the end of 1945, 37 cases had been filed with this board.

Contract settlement procedures aided in the rapid reconversion of industry from war to peace. By the end of 1945 substantial progress had been made toward settling the 130,000 contracts involving \$25,000,000,000 in cancelled commitments, terminated at the time of the Japanese surrender or then pending settlement. Industry expressed its satisfaction at the way in which government had handled contract settlement. By the end of 1945 the Office of Contract Settlement had submitted five quarterly reports to congress detailing the status of settlement progress. (See also WAR PRODUCTION, U.S.) (R. H. H.)

**Co-operative Movement.** British co-operative societies in many areas in 1945 were busily buying up local shops in order to extend their business; and the movement was also launching out into the acquisition of hotels, theatres, holiday homes and extensive new premises for the Co-operative college, for which a large endowment fund was being raised as part of the centenary celebrations of 1944. The London Co-operative society, the largest in the world, acquired a new central store at Oxford circus. A proposal to amalgamate the English and Scottish Co-operative Wholesale societies failed to secure endorsement in Scotland. Late in 1945 there was much activity in connection with the restoration of the movement in countries freed from nazi occupation. Under the nazis the movement was not suppressed, except in Germany itself, but it was subjected to nazi control. After Europe's liberation it was being reorganized with the aid of the International Co-operative alliance, which in 1945 had an affiliated membership of well over 70,000,000. The alliance held its first postwar conference in London during 1945, and co-operative delegations from Great Britain visited a number of continental countries, including the soviet union, Poland, France and Scandinavia.

A report issued by the International Labour Office surveying the world co-operative movement showed that before World War II there were altogether about 143,000,000 members in co-operative societies of all types, including agricultural, producers', credit and housing societies as well as consumers' stores. Of these, 60,000,000 were in the U.S.S.R., 52,000,000 in the rest of Europe; 15,000,000 in Asia; about the same number in America; 500,000 in Oceania, and about 330,000 in Africa. The British consumers' societies had about 9,000,000 members, and were handling about one-quarter of the total grocery trade of Great Britain, and smaller proportions of many other household supplies. Expansion was checked in wartime by the rationing system, but was likely to be resumed as soon as conditions allowed.

In the general election of 1945 the Co-operative party, fight-

ing in alliance with the Labour party, won 23 seats, as compared with only 9 in the previous parliament. This was in face of a vigorous attack on the co-operative societies, launched by the Conservatives in the course of the election campaign. Three Co-operative M.P.'s held offices in the new Labour government, including A. V. Alexander as first lord of the admiralty and Alfred Barnes as minister of war transport. The Co-operative union continued to be represented, together with the Trades Union congress and the Labour party, on the National Council of Labour, which acts as a general body for making declarations of policy on behalf of the entire working-class movement, but, while acting in parliament through the Labour party, maintains its own separate electoral organization. Among the new peerages conferred by the Labour government in order to strengthen its representation in the house of lords were those conferred on R. A. Palmer, general secretary of the Co-operative union, and president of the International Co-operative alliance, and on R. C. Morrison, Co-operative and Labour M.P. for Tottenham and a leading authority on the utilization of waste products. (G. D. H. C.)

**Coordinator of Inter-American Affairs:** see INTER-AMERICAN AFFAIRS, OFFICE OF.

**Copper.** The world production table for copper is that compiled by the U.S. bureau of mines. Data were fairly complete for the war years from most of the major producers.

Table I.—World Production of Copper, 1940-44  
(Thousands of short tons)

	1940	1941	1942	1943	1944
Belgian Congo . . . . .	164.0	178.8	182.9	173.0	180.0
Canada . . . . .	327.8	321.7	301.8	287.6	273.9
Chile . . . . .	388.0	513.1	539.2	561.5	537.5
Mexico . . . . .	41.4	53.7	56.7	54.9	45.5
Peru . . . . .	48.5	40.6	38.9	36.8	35.7
No. Rhodesia . . . . .	293.9	270.7	280.7	276.8	248
U.S.S.R. . . . .	173	?	176	?	?
United States . . . . .	878.1	958.1	1,080.1	1,090.8	972.5
Total . . . . .	2,688	2,903	3,039	3,064	

Reductions in output were the order of the day, with only Belgian Congo as an exception among the major producers, and Australia, South Africa and Cuba among the minor producers. Countries which made 77% of the 1943 output had a 7% decrease in 1944.

Copper cakes ready for shipment at the Chuquicamata mine in Antofagasta, Chile. One of the world's largest deposits of copper, the mine is owned by the Anaconda Copper Mining company

United States.—The salient features of the copper industry in the U.S. are shown in Table II.

Table II.—Data of Copper Industry in the U.S., 1940-44

	(Thousands of short tons)				
	1940	1941	1942	1943	1944
Mine output . . . . .	878.1	958.1	1,080.1	1,090.8	972.5
Smelter output . . . . .	909.1	966.1	1,088.0	1,092.9	1,003.4
Refinery output . . . . .	1,313.6	1,395.3	1,414.6	1,379.3	1,221.2
Domestic ore . . . . .	927.2	975.4	1,064.8	1,082.1	973.9
Foreign ore . . . . .	386.3	419.9	349.8	297.2	247.3
Secondary recovery . . . . .	532.0	726.4	927.8	1,086.0	950.9
From old scrap . . . . .	333.9	412.7	427.1	427.5	456.7
From new scrap . . . . .	198.2	313.7	500.6	658.5	494.2
Imports . . . . .	491.3	735.5	764.4	716.7	787.2
Exports . . . . .	427.7	158.9	210.5	294.5	237.5
Available for use* . . . . .	1,711.1	2,384.6	2,395.6	2,229.0	2,227.6

\*Available for use includes total refinery output, secondary from old scrap, and imports less exports; secondary from new scrap is only a turn-over of metal in process and does not add to the supply available for use.

With the war over and with reconversion to civilian production well under way the civilian needs accumulated during the war years fell on a copper industry that had already used most of its best ores, was facing increased costs of production, and was threatened with the loss of half of the protection afforded by the four-cent excise tax. Taking all things into consideration, the question was not so much how great the postwar demand was going to be, but rather what proportion of it the domestic industry would be able to carry. The decline in mine output during 1945 was high, the total to the end of October being 651,151 tons. This would indicate a year's total at least 30% less than in 1944, and nearly 40% under the 1943 peak. (See also MINERAL AND METAL PRODUCTION AND PRICES; STRATEGIC MINERAL SUPPLIES.) (G. A. Ro.)

**Copra:** see COCO-NUTS.

**Copyright.** During the year 1945 no change occurred in the provisions of the United States copyright law. Various bills to amend the law were introduced in congress but no final action was taken because of more pressing matters. The main proposals were to afford copyright protection to acoustical recordings manufactured within the United States and to investigate the question of effective legal protection for property rights in original thoughts, conceptions, and ideas in art, literature, science, mechanics and the pure and useful arts.

During the fiscal year ending June 30, 1945, 178,848 registrations of claims to copyright were made. Musical compositions reached an all-time high of 57,835 registrations. Other classes showed a gradual return to prewar figures.

The copyright law in force requires, as one of the conditions precedent to the registration of a claim to copyright in any work, the deposit of two copies of American books and one copy of foreign books, for the enrichment of the Library of Congress. During the fiscal year 1945, 272,092 books and other articles were deposited for copyright registration, including 13,924 printed volumes, 55,872 pamphlets and leaflets, 91,526 periodicals, 5,182 dramas, 67,173 pieces of music, 1,709 maps, 1,953 photographs, 19,780 prints, labels and pictorial illustra-

tions, 3,400 motion pictures and 4,750 works of art and drawings. These were all produced in the United States. From abroad there were received 113 books in foreign languages and 655 books in English.

An active interest in judicial decisions construing the Copyright act resulted in the publication of Bulletin 24 in the series entitled *Decisions of the United States Courts Involving Copyright*. The new bulletin covers the period 1941-43 and is for sale by the Superintendent of Documents, Washington 25, D.C. (S. B. Wr.)

**Corn** (Maize). A 3,000,000,000 bu. corn crop was produced in 1945 in the United States for the third successive year. Its harvest was marred somewhat by early frosts reducing the quality of the crop. The U.S. department of agriculture estimated the total 1945 crop at 3,073,996,000 bu. compared with 3,228,361,000 bu. in 1944 and 2,433,060,000 bu. the ten-year average 1934-43. This estimate included corn for all purposes—grain, silage, forage and grazing. The amount harvested for grain was put at 2,680,000,000 bu. or about 87% of the total, compared with 2,910,000,000 bu. for grain in 1944, which was 90% of the total.

The acreage for harvest was estimated at 92,229,000 ac., or 5% less than was planted in 1944 but more than the ten-year average of 91,209,000 ac. of 1934-43. Yields were about the same as the 33.2 bu. yield of 1944 but much above the ten-year average of 26.8 bu. of 1934-43. The increased yield was attributed largely to the use of hybrid-seed corn which was rapidly becoming universally used through the corn belt. Each state developed varieties best suited to its various soil regions which were being tested in each county. In the corn belt it was estimated that about 80% of the seed used was of hybrid types.

The season was generally favourable for the crop in the early summer but rains kept the crop green and growing until severe frosts came which killed much immature corn. This resulted in about 12% of the grain crop being considered "soft" corn. Soft corn is so immature when frost stops growth that it cannot be kept in storage and it must be used at once before it spoils. Special efforts were made by stock men to use this corn so that the losses for feeding value were not great. Some corn is frosted every year in the northern part of the corn belt where farmers are prepared to handle it, but in 1945 the damage spread into Iowa, Missouri and southern Illinois.

The supplies of corn in the 12 principal markets were much higher than the average through 1945 and also above 1944. Farm prices were constantly below those of 1944 and fairly stable throughout the year. The demand for corn for industrial uses continued strong, but the total amount used was only

about 280,000,000 bu. out of the 3,000,000,000 bu. crop. Most corn is fed on the farms where it is raised. The stock of corn to be carried over was nearly 100,000,000 bu. larger than 1944 and represented a reversal of the downward trend of the previous World War II years when the large livestock feeding demand had reduced stocks. Regarding grains needed for food and feed an order was issued in August 1945 prohibiting the use of corn in making alcohol. The amount of corn used for alcohol and distilled spirits increased from 18,000,000 bu. in 1938 to a high of 56,000,000 bu. in 1942 after which time such uses were restricted.

Exports of corn were not large during the World War II period, dropping from 43,800,000 bu. in 1939 to 4,800,000 bu. in 1942; 17,000,000 bu. in 1944; and increasing slightly in 1945. (See also VEGETABLES.)

## Cornell University.

An institution of higher learning, nonsectarian and co-educational, at Ithaca, N.Y., founded in 1865 and incorporated as a land-grant college under the Morrill act of 1862. The university comprises the endowed schools and colleges of arts and sciences, engineering, architecture, law, medicine and nursing, and the state-supported colleges of agriculture, home economics and veterinary medicine. There are also schools of education, nutrition, business and public administration and industrial and labour relations. The divisions of medicine and nursing are in New York city and are operated in conjunction with the New York hospital. Two experiment stations, at Geneva and Farmingdale, N.Y., are operated in connection with the college of agriculture. Degrees for advanced study other than professional are awarded through a graduate school.

In 1945 the school of business and public administration was formally constituted, and the New York State school of industrial and labour relations admitted the first group of entering students. The establishment of a graduate school of aeronautical engineering was announced. The university was designated for the operation of a navy reserve officers training corps unit. (For statistics of faculty, student enrolment, library volumes, endowment, etc., see UNIVERSITIES AND COLLEGES.) (E. E. D.)

## Cornhusking.

For the fourth straight year, competitive cornhusking in the United States was bypassed for concentration upon wartime harvests. The annual event was expected to be continued in 1946. Floyd Wise of Prairie Center, Ill., last won the championship in 1941.

## Costa Rica.

A Central American republic, located between Nicaragua and Panamá. Area, 23,000 sq.mi.; pop. (off. est. Dec. 31, 1944) 725,149. Eighty per cent of the population is classified as white; an estimated 3% are Negroes who live mainly on the Caribbean coast. The major portion of the population lives on the Meseta Central, or central plateau. The capital is San José (pop. 77,182 by 1944 est.); other urban centres are Alajuela (10,170), Cartago (12,933), Heredia (10,578), Limón (10,033), Puntarenas (8,547). Language: Spanish. President in 1945: Teodoro Picado Michalski.

**History.**—The year 1945 was a quiet one politically with the only disturbance of consequence at the very beginning, when

on New Year's eve armed groups were reported to have fired at the homes of Pres. Picado and Manuel Mora, leader of the leftist Vanguard Popular party. During subsequent charges and countercharges among political factions, War Minister René Picado, brother of the president, resigned with his duties assumed by the chief executive. In June, leader of the Conservative party and former president León Cortes Castro told the press he would not be a candidate in 1948 because he feared the election would not be free. A proposal to re-establish public balloting in place of the existing secret ballot was defeated in congress by a narrow margin in October.

While there was little action politically beyond factional bickering, 1945 saw great concern over the government's very unfavourable financial situation. In the first half of the year current obligations and salaries of government employees were in arrears in varying degrees. It was announced in August that an advance of \$125,000, based on estimated taxes for the remainder of the year, had been obtained from the United Fruit company to meet current needs, and later a bond issue of 20,000,000 colones was authorized by congress in connection with a fiscal reform plan. Designed to care for the floating debt, it was taken over by local banks. Three basic fiscal reform laws were passed by congress in August; they provided for a bureau of the budget, a general accounting office, and a reorganization of the treasury department. The measures became law the following month. Earlier, in March, an office of economic defense had been created and charged with control of import quotas and prices.

In the field of foreign relations Costa Rica participated in both the Inter-American Conference at Mexico City and the United Nations Conference at San Francisco, and the United Nations charter was ratified in August. Costa Rica agreed to contribute \$400,000 to U.N.R.R.A. over a three-year period. A treaty of amity with China, signed in 1944, became effective in June. The nation showed no great interest in a plan for Central American union discussed in meetings between the presidents of Guatemala and El Salvador, although Pres. Picado indicated he would submit the proposal to popular vote when and if the proper time arrived.

Data released by the United States showed that lend-lease military goods supplied during World War II to Costa Rica amounted in value to \$139,000.

**Education.**—Primary schools in 1941 numbered 761, with an enrolment of 73,217; 49 intermediate schools listed 7,251 students; and the national university had an enrolment of 820. The literacy rate, estimated at 76%, is the highest in Central America.

**Finance.**—The monetary unit is the gold colón, valued at 17.79 cents U.S., but not in ordinary circulation. A preliminary report listed expenditures for 1944 at 67,000,000 colones and revenues at 52,800,000 colones. The 1945 budget as submitted to congress set expenditures at 64,961,943 colones, revenues at 65,000,000 colones. The floating debt in September amounted to about 12,000,000 colones.

**Trade and Communication.**—Foreign trade for the first six months of 1945 was about 14% greater than for the first half of 1944. Imports for this period were valued at \$12,371,268 (1944: \$10,353,947); exports were worth \$7,078,106 (1944: \$6,682,726). In 1942 the nation had about 450 mi. of railroads and 771 mi. of improved highways. A blocked tunnel on the important rail link connecting the capital with the Caribbean coast was finally opened in Aug. 1945. Registration of motor vehicles (Jan. 1, 1945) showed 2,494 passenger automobiles, 1,310 trucks and 437 buses of which only 263 were in operation.

**Agriculture.**—Coffee is the major agricultural crop; exports for the Oct. 1, 1944–Sept. 30, 1945, crop year totalled 359,070

bags of 60 kg. each. Cocoa exports for 1944 amounted to 9,220,795 lb., a substantial decrease from the 12,224,842 lb. exported in 1943. Cotton production for the year ended June 30, 1945, was 102,500 lb. of lint cotton. Vegetable oil-seed meal produced in 1944 amounted to 14,500 quintals. Lumber exports, mainly balsa, in 1944 totalled 1,795 metric tons; by Sept. 1945 balsa output was reported to be declining.

**Cotton.** Cotton Manufacture.—The role of cotton in the world economy became increasingly complicated in 1945. The end of World War II brought no letup in the demand for cotton products, but at the same time there were prospects of difficult times ahead for the fibre.

Possibly at no time during the war years was the scarcity of cotton apparel more evident than at the beginning of the peace. Shelves were bare not only in the United States but throughout the world. The outlook was summarized by an official of the Civilian Production administration late in 1945 as follows: "Possible output of cotton textiles in the United States in 1946 was expected to be less than 9,000,000,000 linear yards, while potential demand, including export, was estimated at 12,000,000,000 yards." Asserting that the "domestic market will absorb all the cotton goods that can be produced, and clamor for more," this government representative indicated that actual needs for export in 1946 were expected to total 4,500,000,000 yards, whereas not more than 1,250,000,000 to 1,500,000,000 yards could be spared for such use.

Consequently, full-time operation of cotton mills appeared to be certain for at least another year, and probably longer. However there were complications in sight. The primary ones were the ever-increasing competition from synthetic fabrics and the threatened competition from low-cost areas. Recognition of the significance of this double threat was manifest in the remarks of speakers at the Cotton-Textile Institute meeting in Dec. 1945, who appealed for intensive research, not only by organizations set up for that purpose, but by every individual manufacturer to the end that high-efficiency and high-cost machinery be made the basis of production. On a direct wage basis, it was pointed out that cotton textiles made in the United States would have scant chance against those made in Europe and the orient. (See also LINEN AND FLAX; RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY; WOOL.)

(D. G. Wo.)

**United States Production.**—The 1945 cotton crop of the United States was estimated at 9,195,000 bales of 500 lb. each, the smallest crop after 1921. The year's crop was 3,035,000

COTTON CROP in the United States. The figure for 1945 is the department of agriculture's estimate of Dec. 1

bales less than the 12,230,000 bale crop of 1944 and about the same amount below the ten-year average of 12,293,000 bales, 1934-43. Except for 1921 when the heavy boll weevil losses brought the United States crop down to 7,945,000 bales, the 1945 production was the smallest after 1896. The reduced crop of 1945 was primarily because of reduction in acreage to a total of only 17,688,000 ac. compared with 26,000,000 ac. harvested in 1944 and an average of 25,616,000 ac. in 1934-43. The season was generally unfavourable at planting, growing and harvesting times. The weather was considered the worst for cotton growing in 50 years. Abandonment was 2.6%, leaving the acreage for harvest the smallest after 1884. The losses were particularly heavy in Oklahoma and Texas. The high record of cotton acreage was in 1925 when 45,968,000 ac. was grown, more than twice the 1945 area. The average yield was estimated at 249.6 lb. per acre in 1945, 43.9 lb. less than the all-time high record yield of 293.5 lb. in 1944 but 18.6 lb. above the ten-year average of 231 lb. Picking and ginning was delayed by wet weather and was behind the average up to Dec. 1, 1945. The cottonseed production was estimated to be 3,703,000 tons which is 24% below the 4,902,000 ton yield of 1944 and 28% below the ten-year average of 5,175,000 tons.

The crop of American-Egyptian cotton was estimated at 4,300 bales compared with 8,800 bales in 1944 and an average of 34,300 bales during 1934-43. The acreage harvested, almost all in Arizona, New Mexico and Texas, was only 6,200 ac. compared with 14,700 ac. in 1944 and an average of 73,500 ac. 1934-43. Boll weevil damage was serious in some localities due to the vigorous growth because of wet weather.

The total tonnage of fertilizer used on cotton was estimated at 1,477,000 tons, a little less than was used in 1944 compared with the ten-year average of 1,424,000 tons in 1934-43. About 48% of the acreage was fertilized at the average rate of 335 lb. per acre. The cost of picking was high because of the shortage of labour, although mechanical pickers were used wherever available. Few new machines were made in 1945, however. The income per acre of cotton from lint and seed was estimated at an average of \$67.40 per acre in 1945 compared with \$74.67 in 1944 and \$62.03 in 1943. For the fifth successive year the total value of the crop exceeded \$1,000,000,000 which is above the totals for 23 of the preceding 36 years.

U.S. Production of Cotton by States, 1945 and 1944

State	1945 bales	1944 bales	State	1945 bales	1944 bales
Texas . . . . .	1,820,000	2,646,000	California . . . . .	370,000	327,000

Louisiana . . . . .	395,000	620,000			

**World Cotton Production.**—Preliminary estimates placed the world's total cotton production in 1945-46 at 22,650,000 bales (478 lb. net) or about 7% below the previous crop and 27% below the 1935-39 average. This was expected to be the smallest world crop in 22 years. The increase of more than 1,000,000 bales of foreign production was more than offset by the decrease of 3,035,000 bales in the United States. In India cotton acreage was reduced about 30% in 1944 to grow more food crops, but in 1945 a shift back to cotton was reported. Since the planting extends from March to December, the actual crop of the season 1945-46 was not determined up to Jan. 1, 1946. Egypt reduced the cotton area in favour of food crops and corn to about half prewar area but expected an increase in the 1945-46 crop. In East Africa the crop prospects indicated a crop larger than in 1944-45. The cotton area in Brazil was reported to be about 20% below the previous year. Production in north Brazil

AN AIRBORNE chemical defoliant dropped by skimming planes stripped the cotton plants of leaves in 1945, allowing them more sunlight and freeing the crop of leaf stains, when harvested. It was thought defoliation might pave the way for the mechanical picker

has declined in recent years as the result of drought and labour emigration.

The total world supply of cotton reached the high point after 1938 in 1944 with a total of 50,604,000 bales. The carryover in Aug. 1945 was 26,564,000 bales compared with 25,800,000 a year earlier. This total in 1945 included 11,164,000 bales in the United States and 15,400,000 bales in foreign countries. Although the United States carryover in 1945 was larger than in 1944 the total supply was smaller and included a large proportion of shorter staples and lower grades. Mill consumption of cotton declined steadily from the peak consumption of nearly 12,000,000 bales in 1942. Mill consumption also steadily declined from the peak of 30,600,000 bales in 1936 to 23,860,000 bales in 1944. In Great Britain, manpower was transferred to other industries although the demand for textiles was strong. Neutral countries had restricted supplies of raw cotton due to the Allies' fear that it might reach the enemy countries. The general labour shortage in the United States was the chief cause of restricted consumption since the demand for cotton textiles was strong.

The cotton surplus problem continued to engage the attention of both the government and the cotton trade in 1945. Several conferences were held to work out a plan to be developed following World War II. The government was committed to support the price of cotton at 92½% of parity until two years after the official end of hostilities. The subsidy of four cents per pound for exports was offset somewhat by the rise in price of cotton to 22.38 cents per pound by midseason, compared with 21.4 cents in 1944. This was 106% of parity which made the 92½% loan ineffective. Exports during the 1944-45 season amounted to 2,006,000 bales, the largest after 1939-40, when the total was 6,200,000 bales. Government estimates indicated that about 3,000,000 bales would be exported in the 1945-46 season. Most of U.S. exported cotton went to Great Britain but that country had large purchases in other countries that were likely to reduce its purchases in the U.S. in 1945-46. The competition of new fibres with cotton continued to grow in 1945. Rayon was the most serious contender and was increasing at a rapid rate. Cotton from foreign countries was also offering a threat to U.S. production unless export subsidies could be provided to meet the lower prices of foreign cottons. Experiments to discover new uses for cotton fibre were continued with some promise of practical results. The department of agriculture set a goal for 1946 at 9,800,000 bales, or 20,000,000 ac.

**Craig, Malin** (1875-1945), U.S. army officer, was born Aug. 5 at St. Joseph, Mo. Graduating from West Point (1898), he was commissioned a second lieutenant and served in Cuba during the Spanish-American War. He later served with U.S. army forces in China and the Philippines. At the start of World War I, Gen. Craig, who had been on the war department staff, was assigned to the west coast where he helped organize the 41st division, of which he became chief of staff. He went overseas (1917) and as chief of staff of the 1st corps he helped plan the Aisne battle (1918) and subsequent operations at Champagne-Marne, Aisne-Marne, St. Mihiel and the Meuse-Argonne. He was then promoted to brigadier general and won decorations from the various Allied governments. He remained in Europe as chief of staff of the U.S. forces at Coblenz until mid-1919. Following his return to the U.S., he held a variety of high army positions at home and abroad, and in 1935 he was appointed by Pres. Roosevelt to the post of chief of staff of the U.S. army, holding that office until his retirement, August 31, 1939, with rank of general. During his tenure, the small U.S. army was increased, at his insistence, by half again its size, and he inaugurated an intensive program of mechanization with emphasis on the streamlining of ancient techniques and equipment. In Sept. 1941 Gen. Craig returned to public service as chief of the personnel board for the secretary of war. He died in Washington, July 25.

**Cranberries:** see FRUIT.

**Craven, Frank** (1880-1945), U.S. actor, was born in Boston, Mass. Both of his parents were actors and they coached the boy in his first rehearsals behind the footlights. He made his debut on the stage at the age of seven at his mother's side. At 16, he was playing in stock shows. His role in *Bought and Paid For* on the New York stage in 1910 won him critical acclaim as an outstanding actor. The play ran for more than a year on Broadway, toured the country and played in London, England. Craven tried his hand as a playwright while in his 30s and wrote several successful productions including *Too Many Cooks*, *Spite Corner*, *New Brooms*, and *That's Gratitude*. He alternated his play and script writing with appearances in motion pictures and on the stage and won

warm affection from his audiences by his casual and homey manner and his shuffling gait. He was described by Brooks Atkinson as "the best pipe and pants-pocket actor in the business." He played in both stage and screen versions of *Our Town* (1938), and made his last appearance on the New York stage in *Mrs. January and Mr. Ex* in 1944. His last two motion pictures were made in early 1945—*The Suspect* and *Colonel Egingham*. Craven died in Beverly Hills, Calif., Sept. 1.

**Credit, Consumer:** see CONSUMER CREDIT.

**Crerar, Henry Duncan Graham** (1888— ), Canadian army officer, was born April 28 in Hamilton, Ont. Educated at Upper Canada college and the Royal Military college, Kingston, he was commissioned a lieutenant in 1910. He served in France during World War I, rising to the rank of lieutenant colonel, and in 1925 he was a general staff officer attached to the British war office. At the outbreak of World War II, he was made a brigadier and later a lieutenant general, but voluntarily stepped down to the rank of major general in order to assume command of a Canadian division in England. Gen. Crerar became a corps commander on April 6, 1942. He commanded the 1st Canadian army corps with the British 8th army in Italy, and on March 21, 1944, he was made commander of the 1st Canadian army in England. On D-day, June 6, 1944, an estimated 10,000 troops of Crerar's army landed in France. After Patton's breakthrough at St. Lô, Crerar's troops pierced the German right flank and reached the Seine. In the late autumn of 1944, Crerar's forces had retaken many coastal ports in northern France and had trapped a German garrison at Dunkirk. On Nov. 20, it was announced that Crerar had been made a full general. On March 22, 1945, Crerar's Canadian 1st army and the British 2nd opened a concerted drive between Arnhem and Düsseldorf. They stormed the Rhine river and then marched northward into the Netherlands and Germany. Crerar's 1st army cut off German escape routes in the Netherlands. The Canadians and British swept northward to Bremen and Hamburg as the war ended.

### Crewe, Robert Offley Ashburton Crewe-Milnes,

1ST MARQUESS OF (1858-1945). British statesman and writer. was born Jan. 12, in London. He held many distinguished political and diplomatic posts during his long career, including those of lord privy seal (1908 and 1912-15), secretary for India (1910-15), ambassador to Paris (1922-28) and war secretary (1931). He resigned his leadership of the Liberal party in the house of lords in late 1944 because of ill health. Lord Crewe, author of several books, was a frequent contributor of English and Greek verse to London newspapers. He died at his country seat in Leatherhead, Surrey, June 20. (See *Encyclopædia Britannica*.)

**Cricket.** Throughout Great Britain in 1945 the desire and the need for entertainment suddenly increased after the conclusion of World War II, and in cricket the demand was well met. In London huge crowds attended the admirable program arranged by the Marylebone cricket club. This included three out of the five "Victory" test matches against the pick of the available Australian cricketers. On several occasions the gates at Lord's had to be closed soon after the start of play. Never was the need more evident of enlarged accommodation and improved amenities on the major cricket grounds.

The Australian test teams were chosen from members of the royal Australian air force and of the army unit stationed at Eastbourne. Captained by A. Lindsay Hassett, who played

against England in the tests of 1938, the Australians showed such skill and characteristic tenacity that, with four test matches played, they led by two matches to one. England, captained throughout by W. R. Hammond, won the fifth match, at Manchester, and so drew level on the whole series. For Australia the outstanding cricketer was K. R. Miller of Victoria, whose batting average in the tests was over 63. He displayed a controlled brilliance that recalled some of the greatest Australian cricketers of the past. But perhaps the most memorable individual performance was that of D. R. Cristofani of New South Wales, the youngest member of the team, who, when the match at Manchester seemed lost to his side, came in at number nine to score 110 not out in under two hours. For England Hammond was often at his own unrivalled best in batting; but no new reputation was made, and, except for R. Pollard of Lancashire, the shortage of bowlers of quality was manifest.

Once more the competitive spirit was seen at its strongest in the league cricket of the north and midlands and many of England's leading cricketers took part in it each Saturday. Among these was G. H. Pope, the Derbyshire professional and all-rounder. As a result of a financial dispute with M.C.C. arising from the second test match, Pope refused to play in the third, at Lord's. This stand on Pope's part was important as indicating the need for equitable scrutiny into the remuneration of professional cricketers.

In September Brigadier R. S. Rait Kerr, secretary to the M.C.C., resumed his duties at Lord's which had been performed during the war by Sir Pelham Warner. (R. C. R.-G.)

**Crime.** With three and one half years of World War II marked by numerous declines in the rates for various crimes, the advent of peace in the summer of 1945 brought with it a pronounced criminal upsurge in the United States, as was to be expected. Comparison of the first half of 1945 with the corresponding period of 1944 shows that all but one of the so-called "reportable offenses" showed an increase over earlier levels. The largest percentage gain was in burglary (12.1%) with aggravated assault close behind (11.3%). Sole exception to the general upswing was negligent manslaughter, which was greatly affected by the war-connected decline in motor vehicle mileage and motor vehicle deaths. Even so, manslaughters by negligence dropped by only 1.6%.

Table I provides a comparison of the numbers of each class of reportable offenses recorded in 392 cities large and small.

Table I.—Crime in 1944 and 1945 in U.S. Cities Over 25,000 Population (Total Population, 51,054,723)

Offense classification	January to June		Per cent change in 1945
	1944	1945	
Murder and non-negligent manslaughter . . . . .	1,313	1,370	+ 4.3
Manslaughter by negligence . . . . .	1,128	1,110	- 1.6
Rape . . . . .	2,918	3,181	+ 9.0
Robbery . . . . .	12,309	13,539	+10.0
Aggravated assault . . . . .	14,809	16,481	+11.3
Burglary . . . . .	73,208	82,143	+12.1
Larceny (except auto theft) . . . . .	181,373	195,647	+ 7.9
Auto theft . . . . .	55,978	58,556	+ 4.6
Totals . . . . .	343,076	372,027	+ 8.4

Rural crime rates rose more rapidly than those in urban areas, with the single exception of larcenies which showed only moderate increases. This general observation is based chiefly upon the data appearing in Table II, and while the areas there included in 1944 and 1945 are not in all respects identical, they represent total populations of 33,500,000 and 35,700,000 respectively.

Regional distribution of crimes continued to show some marked disparities. Table III presents the situation in 2,249 cities of varied size during the first half of 1945.

Most of the variations in Table III are in general accord with the distributions noted in previous years, although the rela-

U.S. DISCIPLINARY barracks at Green Haven, N.Y., an army prison for about 2,000 soldiers sentenced by general court-martial to terms of from one year to life. Shown above are men striking tents prior to honourable return to active duty on Aug. 8, 1945

tively large influx of a floating population, both military and civilian, on the Pacific coast, probably had some influence on the high levels of crime prevailing there.

Certain types of robbery showed such emphatic increases in 1945 as to challenge attention. Thus the instances in which gasoline and oil stations were the object of attack rose by 75.8%, and bank robberies, long a feature of prewar crime in

Table II.—Crime Rates in Rural Areas and in Unincorporated Communities of Less Than 2,500 Population; 1944 and 1945

Offense classification	Crime rates January to June		Per cent change in 1945
	1944	1945	
Murder and non-negligent manslaughter . . .	2.21	2.52	+14.0
Manslaughter by negligence . . . . .	1.39	1.72	+23.7
Rape . . . . .	4.17	5.11	+22.5
Robbery . . . . .	5.70	6.50	+14.0

Auto theft . . . . .	25.70	26.90	+ 4.7
Totals . . . . .	166.00	183.60	+10.6

Table III.—Regional Distribution of Crime Rates; January to June, 1945

(Number per 100,000 inhabitants)

Geographic divisions	Murder and non-negligent manslaughter	Robbery	Aggravated assault	Burglary	Larceny	Auto theft
New England . . . . .	0.72	6.4	6.0	119.6	234.9	75.8
Middle Atlantic . . . . .	1.19	10.0	15.1	99.1	198.4	68.8
East North Central . . . . .	1.87	29.2	23.3	162.5	392.1	82.6
West North Central . . . . .	1.23	13.3	11.9	118.7	318.3	76.5
South Atlantic . . . . .	6.84	26.6	95.8	191.1	499.0	133.5
East South Central . . . . .	7.88	30.7	75.4	216.9	410.5	132.6
West South Central . . . . .	5.55	19.1	45.0	203.1	569.7	139.6
Mountain . . . . .	2.11	25.1	18.8	221.3	654.9	127.5
Pacific . . . . .	2.33	65.8	35.8	304.7	892.8	270.7

the United States, increased by 257%. With respect to the latter, however, the large percentage rise was predicated on a relatively small number of cases; seven bank robberies in the first half of 1944, against 25 during the corresponding half of 1945.

With respect to losses, the average value of stolen property showed an increase in each pertinent crime classification (robbery, burglary, larceny and auto theft). Average increase in 1945 over 1944 was 8.8%. The dollar loss per offense was especially marked with respect to robbery, which recorded a gain of 44.1% (an average of \$147 per robbery in 1945).

In the longer view, it is of more than passing interest to note that during the 14-year period 1931-44, the crimes of murder, manslaughter, robbery, burglary and auto theft declined in number, with the early years of this period witnessing the more

marked declines. On the other hand, there was an ill-defined upward trend in general larcenies, a strong and quite consistently maintained upswing in rape, and a sharp rise in aggravated assault during the war period. Comparison of 1944 levels with those of 1931 shows that robberies and auto thefts were lower by 47.7% and 42.9% respectively, whereas rape was 110.9% more numerous and aggravated assaults were 37.7% increased. These represented the most marked changes among the eight reportable offenses.

Coverage provided by the *Uniform Crime Reports* continued to increase with 5,448 police agencies contributing to the compilations maintained by the Federal Bureau of Investigation. (See also CHILD WELFARE; FEDERAL BUREAU OF INVESTIGATION; KIDNAPPING; LAW; POLICE; SECRET SERVICE, U.S.)

BIBLIOGRAPHY.—*Uniform Crime Reports* (semiannual bulletins) for 1944 and for the first half of 1945, Federal Bureau of Investigation; *Judicial Criminal Statistics, 1943*, U.S. Bureau of the Census (1945); *Prisoners in State and Federal Prisons and Reformatories, 1942*, U.S. Bureau of the Census (1945). (Br. S.)

Great Britain.—In the absence, after 1938, of publication of national criminal and prison statistics for Britain, it remained difficult in 1945 to assess trends of crime. The total volume of crime was certainly larger in 1945 than in 1938. In December the metropolitan police commissioner reported "a serious and disturbing increase in crime" in the London area. He gave these comparative figures of totals for 11 months in 1938 and 1945 respectively: petty thieving, 33,210 and 53,575; burglary (night entry) 255 and 471; housebreaking (day entry) 4,881 and 6,192; shopbreaking, 5,034 and 11,969; assault and robbery, 145 and 299. Cases in which firearms were used were "practically nil." London police made strenuous efforts to round up deserters from the fighting services, said to number 10,000 toward the end of 1945.

Wartime shortages in police personnel resulted in many crimes going unpunished. In one district this ruled for two out of every three offenses. Black market crime was well under control. Scotland Yard, which rarely issues statements, announced in respect of black marketeering that it was "unable to substantiate by any reliable evidence the somewhat lurid descriptions published in some newspapers of supercriminals controlling a vast organization with widespread tentacles."

By prison rules, 1945, the last vestige of special prison punishment known as "hard labour," deprivation of mattress during the first 14 days of a sentence, was removed. Britain had in 1945 neither "penal servitude" nor "hard labour" but simply imprisonment as the one form of legal sentence. It was also

announced that during World War II criminals undergoing sentence were able to take a six-months' course in engineering in order to do direct munition work for the government. At two prisons women were employed on assembling radio equipment as war work. Men from certain prisons were allowed to undertake farm work and timber reclamation. The latest figures of Borstal training of young offenders indicated, in the official view, that "it may be fairly said that out of every ten persons discharged, some seven or eight appear to be restored to good citizenship."

In October, Dartmoor, for 90 years a convict prison and left unused, was converted into a temporary institution for 250 Borstal boys. Protests at its unsuitability drew official explanations to the effect that there was no other accommodation immediately available.

Sybil Campbell, barrister, became Britain's first woman stipendiary on her being appointed to preside over Thames (London) magistrates' court. M. D. Taylor, a prison medical officer, became Britain's first woman governor of a criminal prison on being appointed to govern Holloway prison, London. (See also PRISONS.) (P. B.N.)

**Crop Insurance:** see AGRICULTURE.

**Cruisers:** see NAVIES OF THE WORLD.

**Crushed Stone:** see STONE.

**Cryolite.** Imports of natural cryolite from Greenland into the United States dropped from 51,968 short tons in 1943 to 17,562 tons in 1944. Just to what extent artificial cryolite was produced and substituted for the natural mineral was not known, but practically a complete substitution could be made if it were necessary. One plant for making artificial cryolite was known to have been in operation on a reduced scale in 1944, and two other plants, completed in 1943, were not used, since supplies of the natural mineral were maintained. Adequate supplies and stocks, coupled with a heavy reduction in aluminum output permitted the removal of all restrictions on the use of cryolite in Oct. 1944. (G. A. Ro.)

**Cuba.** A West Indian republic, including the island of the same name, the Isle of Pines and other minor islands; total area, 44,217 sq.mi.; pop. (1943 census) 4,778,583. The capital is Habana, with a pop. of 659,883, excluding suburbs. The largest suburb, Marianao, had a pop. of 120,163 in 1943. Other urban centres of importance are Camagüey (80,509), Cárdenas (37,059), Ciego de Avila (23,802), Cienfuegos (52,910), Guantánamo (42,423), Holguín (35,865), Manzanillo (36,295), Matanzas (54,844), Pinar del Río (26,241), Regla (23,037), Santa Clara (53,981), Santiago de Cuba (118,266). President in 1945: Dr. Ramón Grau San Martín.

**History.**—President Grau San Martín retained control of the political scene throughout 1945 in spite of factional opposition in congress and some threat of revolt. In February the decision of the strong Popular Socialist party (formerly the Communist party) to continue to back him allowed the administration to retain a majority in the senate. In December loss of some Republican party support was indicated in the resignation of Minister of State Cuervo Rubio. The most serious of several reported plots against the government occurred in March, led by a former Habana police chief, José Eleuterio Pedraza. Several political assassinations took place during the year. Former President Fulgencio Batista remained away from Cuba on a leisurely trip through other western hemisphere countries, but his public statements on various occasions indicated that he was not through with politics and one statement in August, that

there was no possibility of agreement between himself and President Grau San Martín, gave evidence that he would become a member of the opposition whenever he should decide to return.

Members of President Grau San Martín's cabinet were under political attack on various occasions and rumours of resignations were frequent throughout the year. One resignation was handed in in April; however, the major reorganization of the year took place in October when four posts were affected including both that of state and the prime ministry. In December the president of the senate, Eduardo Suarez Rivas, resigned together with his staff.

Negotiations with the United States over disposal of Cuban sugar crops, upon which Cuban economy depended, were of concern throughout the entire year. The contract covering the 1945 crop had failed of arrangement in 1944, and pending completion it was necessary in January to authorize shipments in advance. It was finally signed at the end of March, with the United States purchasing the bulk of the crop at a price of 3.10 cents per lb., a substantial increase over the 2.65 cents per lb. paid in 1944. The agreement also included 70,000,000 gal. of blackstrap molasses and 20,500,000 gal. of industrial alcohol; in addition the United States guaranteed to protect Cuba against price increases on basic foodstuffs shipped from the United States. Negotiations for sale of the 1946 crop started shortly afterward but in spite of intermittent discussions both in Habana and Washington no agreement could be reached. The major problem was less a question of price than of a guarantee to Cuban producers that the United States would purchase not only the 1946 crop but also that of 1947 and possibly 1948 as well. Legislation in the United States prevented a contract for more than a single year and there was also some opposition to buying in excess of anticipated decreased needs.

In the field of foreign relations, a strong popular movement developed for a rupture of diplomatic relations with the Franco regime of Spain, with student groups and communists taking the lead. Various resolutions were introduced in congress during the year, and in October both houses endorsed the idea. The administration refused to break relations at this time, in all probability because the majority of American nations, including the United States, had not yet done so. During July, when a newly appointed Spanish minister to the United States, Manuel Aznar, arrived in Habana en route to his post, student groups stoned the Spanish embassy and other demonstrations occurred. Popular opinion also favoured recognition of the Spanish republican government-in-exile formed in Mexico in the latter part of the year, but the failure to break with Franco made this impossible. An important step in Cuban commercial relations with Spain was a decree of April 23 releasing frozen Spanish credits.

Cuban representatives participated actively in the discussions of the Inter-American conference at Mexico City and the United Nations conference at San Francisco, and final ratification of the United Nations charter was carried out in October.

President Grau San Martín announced in December that the Cuban contribution to the United Nations Relief and Rehabilitation administration would include 20,000 tons of sugar, \$1,000,000 in cash and certain technical aid.

The year was one of great labour unrest, due in part to the increased cost of living and the frequent shortages which harassed buyers; government price control machinery proved largely ineffective against speculation. Strikes occurred in all phases of the sugar industry and in transportation, and in most cases the government authorized an increase in wages. In November the United States-owned Habana streetcar system was intervened by the government to enforce a 6% wage in-

crease decreed earlier. An administration order that cinemas must include a stage show with each performance, decreed in order to aid the actors' union, resulted in a strike in August by theatre owners; the law was not repealed but in later months was not generally observed. Foreign corporations showed some concern over a trend toward nationalism evidenced in a July decree providing that foreign technicians could be employed only when a Cuban was not available, and then only for a limited period until a national could be trained to do the work.

The serious drought of the early months of the year, said to be the worst in 86 years, added to the hardship of the Cuban masses. In June rioting occurred in connection with meat shortages. Sugar rationing eventually became necessary, and coffee exports were frozen in July. In April arrangements were made with the War Food administration of the United States for the supplying of flour to meet a shortage.

**Education.**—Urban and semiurban primary schools numbered 4,264 in 1942 and had enrolled 445,706 students. Elementary civic-rural schools numbered 1,113; enrolment, 57,050. There were 24 secondary schools with 18,664 students, and 4 arts and crafts schools. Enrolment at the National university in Habana was 13,949. Expenditures for education in 1944 amounted to 30,910,000 pesos.

**Finance.**—The monetary unit of Cuba is the peso, officially pegged at par with the U.S. dollar. Preliminary figures estimated total 1944 revenues at 162,622,836 pesos, and expenditures at 150,793,800 pesos. Since certain extrabudgetary credits were not included in these figures, the surplus indicated was apparent only. Regular budgetary revenue collected during the first ten months of 1945 totalled 127,660,095 pesos (for an equal period in 1944: 114,988,485 pesos). The proposed 1946 budget submitted to congress estimated revenues at 173,382,100 pesos and expenditures at 173,367,575 pesos. The public debt on Jan. 1, 1943, was 118,416,000 pesos. In July Cuba planned purchase of \$50,000,000 worth of gold bullion in the United States bringing its earmarked stock of bullion to a total of 200,000,000 pesos. Money in circulation (Dec. 31, 1944) amounted to 484,372,516 pesos.

**Trade and Communication.**—Foreign trade for the first six months of 1945 was valued at \$365,496,610. Exports were valued at \$255,760,554 (for first half of 1944: \$218,618,343) and imports at \$109,736,056 (for first half of 1944: \$98,856,247). In 1944 total imports were valued at 208,648,434 pesos and exports at 427,058,296; the United States took 89% of all exports and supplied 80.9% of all imports.

Cuba has good transportation connections with other countries both by sea and air. The ending of the European phase of World War II eased shipping conditions and the War Shipping administration lifted all restrictions on general cargo shipments from Cuba to New York in June 1945. British and Swedish cargo vessels also made their first appearance in Habana after the start of the war. The first International Air Transport Operators conference was held in Habana in April and subsequently steps were taken to inaugurate a Cuban civil aeronautics authority.

Railway mileage in 1942 was estimated at 3,850 mi.; there were 2,390 mi. of improved highways and about 2,000 mi. of unimproved. Funds obtained from an Export-Import bank loan were reportedly earmarked for highway construction to the extent of \$9,795,366 on the Central highway, \$3,551,589 on tributary roads and \$710,672 on country roads.

**Agriculture.**—The worst drought in many years curtailed agricultural production in 1945, and a severe though not extensive hurricane in October did damage estimated at \$3,000,000-\$5,000,000. The main Cuban agricultural crop is sugar and sugar derivatives. The 1945 crop, according to preliminary

figures, totalled about 3,924,240 short tons (1944: 4,750,818 short tons). Sugar exports for the first nine months of 1945 amounted to about 3,275,000 long tons; molasses exports for the same period to about 105,703,000 gal. (19,915,000 gal. invert, 85,788,000 gal. blackstrap). Forecast for the 1946 sugar crop placed it at a minimum of 4,500,000 short tons.

The 1943-44 tobacco crop was estimated at about 65,700,000 lb. (1942-43: 41,600,000 lb.), with 1944 exports valued at \$51,744,000, a record (exports for 1943 were worth \$28,051,000). Coffee exports for the 1944-45 quota year totalled 30,369 bags of 132 lb. each, out of an estimated total production of 438,145 bags. The 1944-45 cacao crop amounted to approximately 4,000,000 lb. Vegetables exported during the period Nov. 1944-June 1945 amounted to 13,096,980 lb. as compared with 23,244,898 lb. the previous season. The 1944 pineapple crop totalled 2,430,000 crates (1943: 3,110,000 crates); henequen output was about 27,700,000 lb. (1943: about 26,300,000 lb.); bean production, approximately 80,000,000 lb. some 20% under normal. Honey production of approximately 9,000,000 lb. for the 1944-45 season was under the previous year by 2,000,000 lb. Butter manufacture for 1945 was expected to amount to 3,300,000 lb.; condensed and evaporated milk to about 580,000 cases.

**Minerals.**—Manganese ore shipped to the United States in 1944 amounted to 458,694 short tons; chromium ore to 354,214 short tons. United States government agencies ceased manganese purchases June 30. Oil well drillings in Pinar del Río province were reported as continuing but without success as yet. (See also WEST INDIES.)

**FILMS.**—*The West Indies* (Encyclopædia Britannica Films Inc.). (D. Rd.)

**Curaçao.** An island off the Venezuelan coast, near the mouth of Lake Maracaibo. The same name is applied to the six West Indian islands which form the Netherlands colony of Curaçao. The three islands in the Leeward group, about 40 mi. north of the Venezuelan coast, include Curaçao (210 sq.mi.; est. pop. in 1944, 78,587); Bonaire (95 sq.mi.; pop., 1943 est., 5,725); and Aruba (69 sq.mi.; pop., 1943 est., 35,933). The three small islands in the Windward group, about 500 mi. northeast, with their areas and 1943 estimates of population, include the southern part of St. Martin (17 sq.mi.; pop., 2,337; the remainder of St. Martin belongs to France); St. Eustatius (7 sq.mi.; pop., 1,018); and Saba (5 sq.mi.; pop., 1,229). The only important town is the colonial capital, Willemstad (pop. est., 1943, 33,000) on Curaçao. Principal components of the population, aside from native Curaçaoans, were (1943 est.) English, 7,511; Dutch, 5,156; and Venezuelans, 4,213. Dutch is the official language but many inhabitants speak a patois known as Papiamentu, composed of Spanish, Dutch, African and Portuguese elements. Administrative officials include the governor (appointed by the crown), an elective council, and, for the outlying islands, underlying officials called *gezaghebbers*. The governor in 1945 was Dr. Pieter A. Kasteel.

**History.**—Gov. Kasteel on April 3, 1945, received U.S. Senators Mead, Tunnell and Ferguson, present in the West Indies on an inspection trip. Commodore L. W. Busbey, Jr., succeeded Rear Admiral Frank E. Beatty as commander of the Allied naval forces located at Curaçao, on May 16. With the end of the war in Europe, interest in Curaçao revived in the possibility of a greater degree of autonomy, based on policy statements made by Netherlands officials in the spring of 1944.

**Education and Religion.**—Estimates of school enrolment in 1944 were in excess of 17,000. The predominant religion is Roman Catholicism.

**Finance.**—Curaçao currency was detached from Netherlands currency in

1943 but was kept at approximately its prewar value. The value of the prewar Curaçao guilder was approximately 55 U.S. cents. Total revenues for Aruba in 1944 were 8,942,300 florins (1943: 7,783,200 florins). The 1944 budget totalled 9,291,000 florins (1943: 8,254,200 florins). Sterling balances of about £6,000,000 existed at the end of 1944 but they could not be used effectively for imports. The Netherlands government allotted \$1,300,000 monthly but this met only the minimum needs for dollar exchange.

**Production.**—Aside from petroleum production, the only important items are beans, corn, pulse and aloes (only the last of which is commercially important) and, among minerals, lime phosphate and salt. Production of aloes usually reaches about 500,000 lb. annually. The Aruba refineries began experiments in 1945 with hydroponics to reduce the need for imported foodstuffs.

**Trade and Communications.**—Export of petroleum products (which go chiefly to the United Kingdom) increased 8% in the first quarter of 1945 over the corresponding period of 1944. Despite continuing wartime dislocation of shipping, supplies of essential imports kept up though other importation almost stopped because of the allocation of exchange for imports on the 1941 basis. Most imports consist of petroleum, which comes largely from the Maracaibo fields. The refinery on Aruba, the world's largest, completed in 1945 the processing of the 1,000,000,000th barrel of oil from its opening in Jan. 1929. Aloes shipments to the United States in the first quarter of 1945 totalled 80,243 lb. valued at \$21,784 as against 41,265 lb. valued at \$15,168 in the corresponding period of 1944. Total aloes exports to the United States in 1944 were 212,000 lb. (1943: 515,000 lb.). (R. H. FN.)

**Curling.** Utica, N.Y., Curling club won both the Allen and Mitchell medals to dominate 1945 curling competition. Utica defeated the Ardsley Curling club in both finals, scoring a 16-13 victory in the Allen and a 21-12 decision in the Mitchell test. Utica curlers also won the Emmett medal, but bowed to the New York Caledonians, 17-15, in the Gordon medal final. The Douglas medal went to the Toronto Granites on a 23-11 victory over Ardsley. The Schenectady Curling club won both the Mohawk and Griffith medals, while the St. Andrew's Golf club annexed the Utica and Country club cups. Utica won its first Munson shield in seven years by defeating the Heather Club of Westmount, Quebec, 72-67. (M. P. W.)

**Currency:** see COINAGE; EXCHANGE CONTROL AND EXCHANGE RATES. See also under various countries.

**Curtin, John** (1885-1945), prime minister of the commonwealth of Australia from 1941-45, was born at Creswick, near the gold field of Ballarat, Victoria, on Jan. 8, 1885. The son of a policeman, he was educated at a state school, and began his career as a "printer's devil." Later he worked in potteries and a canister factory. He came under the influence of Tom Mann, the British socialist leader, and from 1911-15 was secretary of the timber workers' union in Melbourne. He wrote many labour pamphlets and articles and in 1917 went to Western Australia as editor of the *Westralian Worker*. In 1928 he entered the federal parliament as labour member for Fremantle. In 1935 he succeeded James Scullin as leader of the opposition, and in 1939 declared labour's absolute support of the war. In 1941 he became prime minister and at the general election in 1943 was returned to power with a large majority. With statesmanlike vision and firm faith he planned and worked for a maximum contribution by Australia in World War II and also laid down the broad outlines of Australia's policy in the postwar world. His adherence to labour ideals and policy never faltered; yet he proved himself a realist, for, although jailed during World War I for anticonscription speeches, he risked sectional opposition by extending compulsory service in the Australian militia for the Pacific war. He was of frail physique and the strain of his great task brought on repeated attacks of neuritis. He died at the prime minister's lodge, Canberra, on July 5.

**Cycling.** Not after 1940 had the international six-day championship race been held but it was forecast by the sponsors of this classic that the event would be restored to the sports calendar during 1946 on an even grander scale than heretofore.

Similar announcements of return to activity were made known by the American Bicycling league, the National Cycling association and other ruling organizations in the sport throughout the United States, Great Britain and Canada.

The same records which stood, unchallenged because of inactivity, from 1941 on continued to obtain during 1945. They were the following:

The N.C.A. sprint championship was won by Tom Saetta of Brooklyn, N.Y., with Mike DeFilipo of Newark, N.J., taking the paced title. The A.B.L. senior road championship went to Marvin Thompson of Chicago, Ill., and Andrew Bernadsky of San Francisco, Calif., took top honours in the junior class. On the distaff side Miss Jean Michels of Chicago won the girls' championship in 1941.

Bob Stauffacher of San Francisco, Calif., was first in two important events: the senior class track championships of the A.B.L. and the Century Road club's senior title. In the former Chuck Edwards, another Chicagoan, won the premier place among the juniors.

One of the last prewar classics was the international bike race held over the American highway from Tegucigalpa, Honduras, to Guatemala City. The last six-day race before World War II struck was held in Montreal, Canada, and was won by the team of Angelo DeBacco of Newark, N.J., and Rene Cyr of Montreal.

The A.B.L. named an All-American cycling group as shown in the following list:

Name	City	Points
George Hurlburt, Jr.	Buffalo	275
Furman Kugler	Somerville, N.J.	195
Jerry Kandler	Milwaukee	190
Iggy Gronkowski, Jr.	Buffalo	115
George Wolf	San Francisco	98
Johnny Weber	Milwaukee	85
James Dolle	Irvington, Ind.	84
Isamer Fiyuyama	Honolulu	79
George Edge	Philadelphia	74
Harry Naismyth	Somerville, N.J.	67
Bruce Burgess	Irvington, Ind.	65
Francis M. Cabe	Honolulu	64

**Czechoslovakia.** Czechoslovakia, a republic in central Europe, established in 1918, was dismembered in 1938-39 as the result of German aggression. Its territory fell under German, Hungarian and Polish domination. Part of it was constituted as a German protectorate (Bohemia and Moravia), another part became an "independent" republic allied to Germany (Slovakia). Before the dismemberment the area of Czechoslovakia was 50,244 sq.mi., the pop. (1930 census) 14,729,536. In 1945 the republic of Czechoslovakia was reconstituted, but its eastern province (Carpatho-Ukraine) was ceded to the soviet union. The remaining area was 49,321 sq.mi., the pop. (1930 census) 14,001,200. Capital: Praha (pop. 848,823). Other important cities: Brno (pop. 264,925), Moravská Ostrava (pop. 125,347), Bratislava (pop. 123,852), Plzeň (pop. 114,704). President (1945) Dr. Eduard Beneš; prime minister, Zdeněk Fierlinger.

**History.**—At the beginning of the year 1945 Russian forces were advancing in the eastern territory of the Czechoslovak republic, in the Carpatho-Ukraine and in eastern Slovakia. A delegation of the Czechoslovak government in London under Minister František Němec established its offices in Užhorod and in Košice. In February the London Czechoslovak government left for Košice via Moscow. There the government was reorganized and the Communists received a strong representation in it. The Czechoslovak ambassador to Moscow, Zdeněk Fier-

EDUARD BENEŠ, last elected president of the Czechoslovak republic, ended a 7-year exile when he returned home on April 7, 1945, to head a provisional government. Shown in civilian clothes (left), he is being hailed on a visit to the city of Pilsen (Plzeň)

linger, became prime minister, and Communists became ministers for the interior, for education, and for information. A Communist became vice-foreign minister, and the ministry of defense was taken over by officers trained in the U.S.S.R.

On May 5, Praha was liberated by forces of the interior, included in the Russian zone of occupation which covered eastern Bohemia, Moravia and Slovakia, while western Bohemia with Plzeň was occupied by U.S. forces. The Czechoslovak government under President Beneš moved to Praha. It included five vice-premiers (one Czech Communist, one Slovak Communist, one Czech Social Democrat, one Czech Popular Socialist, and one Slovak Democrat). Of its 22 members 6 were Slovaks. It represented a coalition of four parties, the Communists, the Social Democrats, Popular Socialists (the party of Dr. Beneš) and the Catholic Peoples party.

The new Czechoslovak armed forces were to be trained and rearmed by Russia with their organization and armament identical to those of the Red army. They were built around the Czechoslovak divisions which served on the eastern front with the Russians while the forces which had served in the west with the Allied armies were disbanded.

A number of Czechoslovak-Germans were tried and executed for treason, among them Dr. Jošeph Pfitzner, professor of history at the German university in Praha and vice-mayor of the city under the Germans. His public execution drew so many protests that this newly introduced procedure was abandoned. Trials of Czech and Slovak collaborators were postponed until 1946. The Czechoslovak government decided to remove the German and Hungarian minorities from the country. The number involved was great, more than 3,000,000 Germans and about 750,000 Hungarians. A special regime was imposed upon the Germans for the interim period; they had to wear white armbands and were subjected to many restrictions.

On Oct. 24, decrees ordered the nationalization of practically all industrial corporations with more than 500 employees. In addition, all natural resources, public utilities, transport, commercial banks and insurance companies became state property. Those owned by enemy nationals or collaborators were taken over without compensation, all the others were paid for in government bonds. No nationalization of agriculture, commerce or small-scale industry was contemplated. Far beyond the eco-

nomie field reaches the nationalization of the whole film industry, including not only the production of films but also all importation, distribution and showing in the motion picture houses, all of which became state property. Imported Russian films were given 60% of the screen time in all Czechoslovak theatres. Of other films, only those could be shown which the government thought conformed to its social and political line.

Territorially, Czechoslovakia lost Carpatho-Ukraine to the Soviet Union and was in a dispute with Poland about Teschen (Těšín). The Czech government claimed from the German Silesian territory which had come under Polish administration the districts of Kladsko (Glatz), Ratibor and Hlubčicko (Leobschütz). This land disputed by Poland would afford to the Czechoslovak industrial centres around Moravská Ostrava a connection with the Oder river.

On Oct. 28 the Czechoslovak provisional national assembly met, not as the result of elections but of an agreement among the parties, to function until the meeting of an elected constitutional national assembly. The provisional assembly was composed of 300 members, 200 Czechs (120 from Bohemia and 80 from Moravia) and 100 Slovaks. The parties represented in the government coalition received equal representation in the national assembly.

**Dahomey:** see FRENCH COLONIAL EMPIRE.

**Dairy Industry, Bureau of:** see AGRICULTURAL RESEARCH ADMINISTRATION.

**Dairying.** The dairy industry made a new high record in 1945. At the beginning of the year the United States department of agriculture estimated that there were 27,785,000 milk cows and heifers on U.S. farms, slightly more than the 27,656,000 head in 1944. The average number during the year 1944 had been above 1943. Excellent pastures brought yield to a new high record or about 123,000,000,000 lb. of milk, 3% above the previous record year of 1943. The output per cow was high, partly due to an abundant feed supply in addition to the good pastures. The average production per cow was near 4,800 lb. which was 5% above 1944 and 1% above the 1942 record.

The large milk production was directed to meet wartime needs and the output of cheese, canned and dried milk was near record levels. Creamery butter production was the lowest, however, in two decades. Dairymen were encouraged by government programs to sell whole milk which reached a total of nearly 70,000,000,000 lb. or 5,000,000,000 lb. above the previous record in 1944, and double the amount sold in 1930. Dairymen sold less cream and had much less skim milk to feed to livestock.

The end of World War II brought change and as early as June 1945 the number of cows had declined 2% below the 1944 number. Fewer heifer calves were saved and production per cow began to decline from the high level. Farm prices of milk and butter fat, controlled by ceiling prices continued almost unchanged through 1944 and 1945. The dairymen's cash incomes were the highest ever reported and reached the total of over \$3,500,000,000, more than double prewar. Government incentive payments, begun in Oct. 1943, were an important factor in maintaining the high production. The total milk production per capita for the country as a whole was 872 lb. in 1945 compared with an average of 805 lb. in 1936-40. The government authorized the continuation of the production program through

June 1946. (See also BUTTER; CHEESE; MILK.)

**Dalai Lama:** see TIBET.

**Dalton, Hugh** (1887— ), British politician, was born Aug. 26 at Neath, Glamorgan county, Wales, the son of a British cleric who was at one time tutor to King George V. The younger Dalton was educated at Eton and King's college, Cambridge, and then studied at the London School of Economics (1911-13). He passed his bar examinations, 1914, but was prevented from practicing by the outbreak of World War I, in which he served with the British expeditionary forces on both the French and Italian fronts. After the armistice, he continued his studies in economics, and began practicing law. Although a Tory by birth and heritage, Dalton joined the newly formed Labour party, and in 1924 he was elected to the house of commons as Labour candidate for the Peckham division. He was parliamentary undersecretary of the foreign office (1929-31), during the first government of Ramsay MacDonald. He lost his seat in commons during the 1931 elections, but was returned in 1935. When Prime Minister Winston Churchill formed his coalition cabinet in May 1940, he appointed Dalton minister of economic warfare, and in Feb. 1942 Dalton was made president of the board of trade. After the Labour party's overwhelming victory at the polls in 1945, Prime Minister Clement R. Attlee named Dalton, July 27, chancellor of the exchequer. Politically, Dalton was a firm adherent of the party program and had expressed himself in favour of gradual socialization of Britain's economy. In his budget speech to commons, Oct. 23, he announced substantial tax cuts in both the income and excess profit brackets.

VIEW showing construction of piers on controlled spillway section of Altus dam, near Altus, Okla. The dam, approximately 98% completed in 1945, was built to irrigate 40,000 acres of land, supply water for city of Altus, and provide flood control

**Dams.** With the ending of World War II, plans for many projects involving dams were pushed to completion in order that construction could be started as soon as materials and manpower became available. Work on many dams, halted during the war, was resumed.

In the United States, at Anderson Ranch dam, construction was proceeding 24 hours per day during 1945 in an effort to complete enough of the dam to provide 45,000 ac.ft. of storage for flood waters in the spring of 1946. By Oct. 1945, the earth-fill had reached a height of 300 ft. above bed rock. When completed, the structure was to be 456 ft. high, the highest earth-fill dam in the world. It was designed to store 500,000 ac.ft. of water to irrigate 34,000 ac. in the Boise valley. An unusual feature of the construction of this dam is the use of a belt conveyor for transporting the fill material nearly two miles from the borrow pit to the site, where it is distributed over the dam by truck.

The construction of the second step of the Ross dam on the Skagit river in Washington, was under way during 1945. The first step was completed in 1940 to a height of 290 ft., creating storage of 70,000 ac.ft. of water. The second step was planned to raise the dam to a height of 475 ft., creating an additional storage of 670,000 ac.ft. This would provide an increased average output at the hydroelectric plants downstream of 300,000,000 kw.-hr. annually. It was planned to raise the dam eventually two more steps of 100 ft. each, to a final height of 675 ft. With Ross dam, the Diablo dam, and future storage at the Gorge dam, the river was expected ultimately to develop 1,120,000 h.p.

In Mexico, Las Virgenes dam, a round head buttress type of dam, was under construction on the San Pedro river, to provide nearly 350,000 ac.ft. of storage for irrigation and power. This unusual type of dam was first used at the Don Martin dam at Coahuila, Mexico, built in 1929. The buttresses of the dam are widened at the upstream edges to a mushroom shape. The

## Chief Dams Completed or Under Construction During 1945

widened edges then join together to form the upstream deck of the dam.

In Uruguay, another round head buttress dam was nearing completion on the Rio Negro. The dam was to provide 4,860,000 ac.ft. of storage for the Rincon del Bonete project, the first important hydroelectric installation in Uruguay. The development was designed to produce 180,000 h.p. and would more than double the country's power supply.

King George VI officially dedicated the Ladybower dam at Bamford, England, on Sept. 25, 1945. The 137-ft.-high dam was in 1945 one of the largest earthfill dams in the British Isles. Constructed for the Derwent Valley Water board to supply Nottingham, Leicester and several other towns of Derbyshire, the reservoir covers 504 ac. and was planned to provide 6,300,000,000 gal. storage capacity.

Designs were being prepared during 1945 for a concrete gravity dam 550 ft. high, on the Sutlej river, Punjab province, India.

As the war drew to a close in Europe, dams in the Roer river valley played an important part. Five dams, totalling 5,826,937,000 cu.ft. of storage, were attacked by the Allies in early Feb. 1945. The control house and gates at the south side of the Schwammenauel dam were blown up by the Germans. At the Urft dam on the Urft river, second largest of the five dams, a conduit was broken by aerial bombs, releasing 1,606,822,000 cu.ft. of storage and flooding the Roer. When the dam was captured on Feb. 4, 1945, the Germans had blown up the spillway gates and destroyed the outlet control towers.

The table herewith lists ten important dams of the world completed or under construction during 1945. (See also AQUE-DUCTS; IRRIGATION; TENNESSEE VALLEY AUTHORITY.)

FILMS.—*Water Power* (Encyclopædia Britannica Films Inc.). (B. O. M.)

**Dance.** The memorable year 1945 proved to be a year of both culminations and beginnings for the dance, as well as for the world in general.

History has made it a matter of record that war is always a great stimulus to the dance. World War II was no exception. What with war benefits, canteen dances, camp shows, free instruction for "the boys," rehabilitation classes and such, the armed forces were made so dance conscious that they became interested not only in seeing dancing but also in participating in it.

In civilian life in the U.S., besides ice ballets and roller ballets, there was a square dance done on horseback at the rodeo. Metro-Goldwyn-Mayer featured swimmer Esther Williams in a water ballet. Television emphasized the dance on the air waves, and Broadway and Hollywood vied with each other to book the best dance talent. After its long and lean Cinderella days, the dance suddenly found itself not only the belle of the ball but the toast at every type of shindig, big and small.

Civic ballets as well as city and community sponsored dance events, courses of instruction, recreational groups and competitions proved that the dance had woven its patterns into the daily lives of the people, as well as occupying the professional limelight.

It is significant that it was just about 20 years before that Martha Graham resigned her prominent role in the Denishawn company to devote herself to serious pioneering in a new dance form. In 1945, Miss Graham was signed for a triumphant world tour. Besides a personal victory this constituted an admirable accomplishment for the so-called Modern Dance.

Miss Graham's repertoire consisted of *Appalachian Spring*, *Herodiade*, *Every Soul Is a Circus*, *Salem Shore*, *Deaths and Entrances*, and the new *Dark Meadow* to music by Carlos Chavez.

In 1945 the ballet companies played to bigger and more enthusiastic houses than ever before. Sell-outs became routine. The following new ballets were presented by Ballet Russe de Monte Carlo: *Ballet Imperial*, *Dance Concertantes*, *Concert Barocco*, *Mosartiana*, all by George Balanchine. These ballets followed the same style of classical variations skilfully woven to the pattern of the music, gorgeously costumed, and executed with skilful, if somewhat brittle, technique. *Comedia Balletica*, first called *Musical Chairs*, also a series of variations carefully set to music and done with a light satirical touch, was choreographed by Todd Bolender, a disciple of Balanchine.

*Frankie and Johnny*, choreographed by Ruth Page and Bentley Stone, was chosen as a ballet to give modernity, humour and relief to the company's repertoire. It overshot its goal considerably, however, and provoked not only severe criticism but also fun poked at it by the press, as "ballet burlesque."

The new ballets presented by Ballet Theatre included a psychological murder study by Anthony Tudor, called *Undertow*, that was murky enough for the most morbid consumption. Leonide Massine contributed *Moonlight Sonata*, a piece without distinction. *The Firebird* was a new version of the well known ballet to Stravinsky's music, done by Adolf Bolm and fabulously mounted, with decor by Marc Chagall. *Graziana* was a classical music visualization of Mozart's music by choreographer John Taras. *Interplay* by Jerome Robbins was a study in juxtaposition of classical and modern technique, done in a flippant manner. *The Gift of the Magi* was a realistic ballet based on O'Henry's story and choreographed by Simon Semenov. The dancing failed to catch the poignancy of the O'Henry masterpiece, but it was light and popular.

*On Stage* choreographed by Michael Kidd was the best and also the most popular of the new ballets. It concerned itself with an appealing drama of a timid young artist trying to capture fame. The leading role, a stage janitor, was played by Michael Kidd, the choreographer. This was a promising first ballet by a gifted young dancer but it revealed so clearly the

HUGH LA'NG and Nana Gollner during the premier performance of *Undertow*, a psychological ballet presented in New York by the Ballet Theatre on April 10, 1945

need of artistic direction in this company.

A new ballet enterprise was a small touring company formed by Leonide Massine to give excerpts from famous ballets. It met with limited success.

The San Francisco ballet directed by William Christensen continued its activity on the west coast giving regular seasons of ballet and touring neighbouring states.

In Canada the Volkoff ballet and Morenoff ballet continued their performances, and the Winnipeg ballet joined the ranks of successful young ballet companies.

Col. de Basil's Original Ballet Russe appeared regularly in South America and as far north as Panamá.

In Mexico a new local Mexican ballet celebrating Mexican themes, artists and dancers was successfully launched by the Campobello sisters. In the summer the National Opera company in Mexico City featured a ballet group from the School of American Ballet directed by William Dollar and George Balanchine. Besides appearances in the operas this group gave special ballet performances and presented works by Balanchine and Dollar to Mexican audiences.

In England the dance became so popular that one critic observed: "The war has made us a dancing nation." The Sadler's Wells ballet danced on the continent, entertaining troops, besides giving its regular season in England. A new ballet by Helpmann was laid in the slums of Glasgow and called *The Miracle of Gorbals*. A new ballet by Andree Howard was called *The Fugitive* and was concerned with a psychological drama of two sisters who were both in love with a fugitive.

Ballet Rambert continued to tour hostels, factories and provincial theatres. Ballets Russe Kyasht, the International ballet and the Anglo-Polish ballet gave regular performances. Ballet Jooss again had a regular London season and presented a new ballet by Hans Zullig called *Le Bosquet*. The London Archives of the Dance were organized under the chairmanship of Cyril Beaumont.

In Paris the Archives of the Dance were happily found intact although Paris companies and dancers suffered severely during the war. By the fall of 1945 steps were taken to reorganize its ranks. Eugene Grunberg was appointed new director of Les

Nouveaux Ballets de Monte Carlo, and a subsidy was granted to carry it on.

In Australia, the Kirsova ballet in Sydney and the Borovousky ballet in Melbourne played to enthusiastic native and expeditionary forces.

The most discouraging aspect of the 1945 ballet season was the dearth of new and significant material. The classical ballets followed the cut and dried formulas of past successes while the modern pieces were trivial or morbid as the case might be, but they all lacked originality, creative flair and inspiration. With the strides that the dance art made after World War I, it was amazing that no ballet was produced that could equal *The Green Table*, dance masterpiece of World War I.

Rapid progress was made during 1945 in bringing dance artists to stage and screen. For years producers had contended the masses could not appreciate art and, therefore, chose dancers for their pulchritude, their personality, their speed and flash. Experiments entertaining soldiers from 1943 to 1945 helped to prove the box office appeal of the best artists.

In 1945, Broadway chose real choreographers to do their dance sequences instead of the proverbial song and dance men. Anthony Tudor did the ballets for *Day Before Spring*, and *Holiday Pinaflore*. Agnes de Mille did the dances for *Carousel*, Jerome Robbins helped produce *On the Town*. Tamiris scored as dancer-arranger in *Up in Central Park*. Balanchine did dances for *Mr. Strauss Goes to Boston*. David Lichine was dance director for *Polonaise*. Esther Junger distinguished herself in the dances for *Dark of the Moon*. Nimura was welcomed back after his absence as the choreographer for the oriental numbers in *Lute Song*.

Among the ranking dancers to grace Broadway were found Irina Baronova, Viola Essen, Anton Dolin, Alicia Markova, Tatiana Riabouchinska, Harold Lang, Mary Ellen Moylan. Vera Zorina added not only to her laurels as a ballerina but also won praises for the beautiful rendition of her lines in Shakespeare's *Tempest*.

Hollywood, not to be outdone by Broadway, signed a host of first-rate dancers and announced a series of dance films such as *Spectre de la Rose*, *Ballerina*, *Life of Pavlova*, *Nijinsky*, to say nothing of ballets woven into regular pictures with such stars as Anton Dolin, Alicia Markova, George Zoritch, Milada Mladova, Marc Platt, Jack Cole and Vera Ellen dancing the leading roles. Tatiana Riabouchinska and David Lichine capped the climax by dancing a duo in Walt Disney's *Make Mine Music*.

The most promising dance work for future development of the art, however, was done by such amateur and semi-professional groups as Lisa Gardiner's Washington Concert ballet, Bernice Holmes Ballet company, the Young Peoples Dance Theatre of South Orange, N.J., the Atlanta Civic ballet, the Pittsburgh Civic ballet, the New Jersey Civic ballet, etc.

La Meri's Ethnologic Dance centre added to its laurels by a Hindu version of *Scheherazade*. Other new works of interest were: *Iberia*, a Spanish ballet; *Krishna and Radha*, a Hindu ballet; *Caribbean Impressions Suite*, *Salome's Dance*, *Gesture Songs*.

The department of education in the New York Museum of Natural History did an outstanding piece of dance education in the free dance programs of historical and national dances given at the museum and also presented in neighbouring museums and educational centres. In fact, the whole educational field made marked progress in incorporating dance art in its curriculum. Besides offering training courses, schools and university-sponsored groups, some educational centres gave concentrated summer courses and others featured workshops directed by professional dancers. Oregon State college developed a dance group that entertained not only the soldiers, but toured neighbouring

towns with a full evening dance concert.

The Dance Educators of America conducted the first normal course for dancing teachers planned along university lines and giving expert graded instruction in all types of dancing along with proper progressive methods and procedures. This bore fruit in standardizing terms and fundamentals as well as improving the quality of the dance instruction given to children and adults.

The greater consciousness of dance art in the general public enlarged the number and scope of touring dance attractions. Among the outstanding of these were Svetlova and Dolinoff, Teresita Osta, Katherine Dunham and company, Iva Kitchell, Mia Slavenska, Miriam Marmein, Agna Enters, Bill Robinson, Edwin Strawbridge, Paul Draper and Patricia Bowman.

Vaslav Nijinsky, so often reported missing, was found alive after the nazi retreat, and was reported improved in health.

(L. Mh.)

**Ballroom.**—The year 1945 was the year of peace but there was no lull in the ballroom. All over the world, marching feet relaxed and danced to such tunes as: "Symphony," "If I Loved You," "You're So Nice to Come Home To," "It's Been a Long, Long Time." Those who did not march kept the same pace at home.

During 1945, dancing was the chief entertainment sponsored by hostess groups all over the world. Many reporters believed that Yankee jitterbugging did much to cement friendly relations abroad.

Through 1945, the fox trot was still the most popular dance. For the first time, rumba ran it a close second. Rumba played on the radio; new rumba tunes were composed—the most infectious being "No Can Do," which swept the U.S. Rumba was accepted and taught in the dignified, social dancing classes held for society children.

Few new tunes were written in waltz tempo. Therefore, the waltz was neglected in the ballroom. Few samba tunes were popular, so the dance never became nationally known. Square dancing showed a head start in 1944 but did not progress during 1945. The tango was rarely done and was played in only a few of the more cosmopolitan night clubs and hotels.

Jitterbug dancing quieted down during 1945 and the steps became standardized so that one no longer heard of sectional dances like the Jersey flea hop, the Georgia jump, and so on. Swing dancing calmed down to keep time with the sentimental songs of the year.

Prominent educators began to recognize the importance of ballroom dancing in the schools. Almost every public school taught its pupils ballroom dancing and some settlement houses requested a juke box before any other recreational equipment.

There were no new dances during 1945, although there was a little flurry of excitement over Mexican dancing toward the end of the year. Dances called La Bamba and La Bambooka were pictured in magazines—but went no further. (A. Mu.)

**Danzig.** This formerly Prussian port on the Baltic sea at the mouth of the Vistula river was constituted by the Treaty of Versailles in 1919 as a free city under the protection of the League of Nations, to give to Poland, the land of the Vistula basin, the necessary outlet to the sea promised in Woodrow Wilson's Fourteen Points. The territory had an area of 754 sq.mi. and a population of 407,000. With the outbreak of World War II in Sept. 1939 the city was annexed by Germany. As a result of the German defeat, the city was incorporated in 1945 into Poland. Prior to World War II the Poles had built, 12 miles to the northwest, on Polish territory, a new harbour in Gdynia which had grown into a modern city of 120,000 population. As a result of the war, much of the old city of Danzig with its historic buildings was destroyed while

the harbour remained intact. In Gdynia the harbour was destroyed while the city was largely spared.

Under the new Polish administration Danzig, called in Polish "Gdansk," was to be enlarged as a great harbour which would also embrace Gdynia and Zoppot (Copot), a fashionable seaside resort between the two ports. In 1945 practically all removable property of commercial and industrial value was removed from Danzig to the U.S.S.R. The character of the population was undergoing a rapid shift in 1945, with Poles replacing the Germans. (H. Ko.)

**Darby, William Orlando** (1911-1945), U.S. army officer, was born Feb. 8 in Fort Smith, Ark., and was a graduate of the U.S. military academy, 1933. During World War II, the United States army decided to set up a select body of shock troops similar to the British commandos. Darby, then a major, was assigned by Gen. Eisenhower to interview and select officers for this unit, which subsequently became known as the "Rangers." The First Ranger battalion officially entered the ranks of U.S. combat outfits on June 19, 1942. Generally they performed what the army signaled as "impossible" tasks. Later, Col. Darby went to the Italian front and saw action there for two years. One of the army's most seasoned combat commanders, he was wounded three times and decorated 10 times. On April 22, he was designated assistant commander of the U.S. 10th Mountain division, a special Alpine unit then engaged in bitter fighting in the Po valley. The war department disclosed on May 1 that he had been killed while leading a combat team.

**Dartmouth College.** During 1945 the navy college training program continued at Dartmouth, under the forms of V-12 and the Naval Reserve Officers Training Corps. During the summer term transition was largely effected from the V-12 program to N.R.O.T.C. Military students, both navy and marines, continued to dominate the campus with a total of about 850 in the navy unit, although the number of civilian students increased to about 400 as compared with about 250 the previous year and 2,400 before World War II. A serious problem was faced in respect to numbers of students seeking admission or readmission as demobilization was effected. Top priority was given to those among the 3,000 undergraduates who left college for war service who wished to return to Dartmouth. In addition, pressure increased late in the year among other groups of prospective postwar students including V-12's with several terms of credit toward the degree and applicants from high schools. The college provided special housing units for married G.I. students. Plans were made to revert to a two-semester calendar plus a short summer term which would be maintained only as long as required by veterans desiring an accelerated program. Ernest Martin Hopkins retired on Nov. 1 after 29 years as president of Dartmouth. He was succeeded by John Sloan Dickey, Dartmouth graduate in the class of 1929, and most recently director of the office of public affairs in the department of state, Washington, D.C. (For statistics of enrolment, faculty, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (S. C. Ha.)

**Daughters of the American Revolution, National Society of:** see SOCIETIES AND ASSOCIATIONS.

**Davis, Elmer** (1890- ), U.S. journalist, radio news analyst and government official, was born Jan. 13 in Aurora, Ind. A graduate of Franklin college, Franklin, Ind., he was a Rhodes scholar at Queens college, Oxford university,

completing his studies there in 1912. Davis was a reporter and editorial writer on the *New York Times*, 1914-24, wrote 12 books, including essays, short stories and satires, and reached the top rung of radio fame in 1939 as a news analyst for the Columbia Broadcasting system. On June 13, 1942, President Roosevelt announced his decision to fuse the various overlapping government information services into a single centralized organization and appointed Davis to head the new organization, known as the OWI (Office of War Information, *q.v.*). Davis had the delicate task of co-ordinating the government's war publicity and propaganda, both at home and abroad. Late in 1943 OWI was the target of attacks from professional newspaper sources, when the British released news of the Cairo conference, and the Russians of the Tehran conference, before U.S. papers were informed. In April of 1944 the OWI director won a two-year fight to share with the army and navy power to make decisions on release of war news. Pres. Truman abolished the OWI Aug. 31, 1945, and directed the state department to take over the structure of the agency's international organization. Davis' resignation was announced Sept. 12, and two months later he returned to the radio field as a news commentator.

**Dawson, Bertrand Dawson,** <sup>1ST VISCOUNT, OF PENN</sup> (1864-1945), British physician, was born at Purley, Surrey, March 9, the son of an architect. He received his medical training at the London hospital with which he was associated all his professional life and where he was appointed full physician in 1906. In 1907 he became physician-extraordinary to King Edward VII and later served as physician-in-ordinary to King Edward VII, King George V, King Edward VIII, and to King George VI and Queen Elizabeth. His elevation to the peerage in 1920 marked the first attempt of a British government to secure the expression of medical opinion in the house of lords. As president of the Royal College of Physicians, 1931-38, Lord Dawson was recognized as head of the British medical profession. He married Minnie Ethel, youngest daughter of Sir Alfred Yarrow, in 1900. They had three daughters. When Lord Dawson died on March 7 the peerage became extinct as there was no son to inherit it.

**DDT:** see ENTOMOLOGY; MEDICINE; WILDLIFE CONSERVATION.

**Deafness.** In 1945, the number of hard of hearing individuals in the United States impaired in one or both ears was estimated to be 10,000,000 to 15,000,000. Of this number, possibly 4,000,000 were seriously handicapped and at least 3,000,000 required hearing aids or the use of lip reading. Probably, no more than 500,000 actually used hearing aids. The Volta bureau, Washington, D.C., estimated 95,000 deaf enough to require specialized instruction in schools for the deaf. The American Society for the Hard of Hearing, Washington, D.C., and its component societies in many cities, provided information and arranged for instruction in lip reading.

Otologists have continued research on the fenestration or window operation for the amelioration of the hearing loss. Percentage of successful results had not (up to the close of 1945), been compiled by an independent evaluating agency. However, most hard of hearing individuals were rehabilitated by hearing aids and lip reading, or a combination of the two. From 1939 on, significant advancement was made in the technical development of the vacuum tube hearing aid. In 1945, it weighed 16 to 18 ounces complete with A and B batteries. These instruments consisted of a microphone, amplifier, battery and receiver. If used for air conduction, the receiver was attached to a moulded ear piece; if for bone conduction,

the receiver pressed against the mastoid.

A new type of hearing aid found favour, which consists of two visible parts only. The batteries are enclosed in the same case with the amplifier and microphone; the ear piece is connected to the case with one cord. The cost of the hearing aids ranged from \$40 to \$175.

Army and navy rehabilitation centres introduced elaborate testing and fitting methods. The results were not available up to the close of 1945. Many deafened individuals were satisfied with a hearing aid selected over the counter by themselves. In difficult cases, there was a definite advantage in employing the fitting procedures. In either case, the hard of hearing person was advised to have his ears examined by a physician before considering the purchase of a hearing aid. A list of acceptable hearing aids may be obtained from the Council on Physical Medicine of the American Medical association. (H. A. C.)

**Deaths** (of prominent persons in 1945): see OBITUARIES.

**Death Statistics.** Mortality in the United States during 1945 was somewhat lower than in 1944; provisional reports covering the first 9 months of 1945 show a death rate of 10.4 per 1,000 population, compared with 10.6 for the same period of the previous year. For the entire year 1944 also, the death rate was 10.6 per 1,000 population, the number of recorded deaths being 1,411,338. Canada, too, experienced an improvement in mortality from 1944 to 1945, according to provisional reports from cities of 10,000 or more inhabitants covering the first nine months of both years; these show a reduction of 2.4% in the number of deaths from one year to the next. During all of 1944, there were recorded 115,918 deaths in Canada, with a death rate of 9.7 per 1,000 population. Mortality in England and Wales during 1945 was practically at the same level as in 1944; this indication is provided by reports of deaths from London and the great towns for the first nine months of each year. There were 492,188 recorded in all of England and Wales during 1944, the death rate being 11.6 per 1,000 population.

Up to the end of World War II the British empire lost 353,652 men in the armed forces killed by enemy action. To this number, the United Kingdom contributed 244,723; Canada 37,476; Australia 23,365; New Zealand 10,033; South Africa 6,840; India 24,338; and the colonies 6,877. There were 30,189 merchant seamen killed. In addition, up to the end of the war in Europe, 60,585 civilians were killed, of whom 26,920 were men, 25,392 women, 7,736 children and 537 unidentified.

The total casualties in the armed forces of the U.S., as reported on Nov. 2, 1945, came to 1,068,794. The killed numbered 273,830, of whom 217,569 were of the army and 56,261 of the navy; the wounded were: army 571,442 and navy 80,260; missing: army 18,311 and navy 8,908; prisoners: army 115,333 and navy 710. In the *Biennial Report of the Chief of Staff of the United States Army*, dated Sept. 1, 1945, it is stated that the war in Europe resulted in 772,626 battle casualties, of whom 160,045 were dead, while the Pacific area had 170,596 casualties and 41,322 dead. It is estimated that in opposing the U.S., British and French armies in Europe, the Germans and Italians lost about 373,600 dead and 85,000 permanently disabled. Japanese losses after Pearl Harbor in the east, including China, are estimated at 1,219,000 dead and 240,000 permanently disabled. The efficacy of modern health practices in the control of disease among troops is shown by the following: the annual death rate from disease among the men in the Mexican War was 10%; for the Civil War (Union troops) 7.2%; Spanish War and Philippine Insurrection 1.6%; World War I 1.3%; World War II .06%.

According to a report to the Japanese diet (*New York Times*, Sept. 7, 1945), Allied air attacks on Japan resulted in 241,309 deaths and 313,041 wounded among the civilians. The atomic bomb released on Aug. 6, 1945, over Hiroshima caused 49,221 civilian deaths and wounded 58,839, while the atomic bomb over Nagasaki on Aug. 9, 1945, killed 21,501 civilians and wounded 51,580. The medical branch of the U.S. strategic bombing survey estimates that Allied bombing killed about 500,000 civilians in Germany, including imported labour.

Provisional death rates per 100,000 population in the U.S. for 1944 from the more important causes of death, as reported by 40 states are as follows: diseases of the heart 320.0; cancer 130.2; intracranial lesions of vascular origin 94.2; nephritis 68.6; total accidents 66.4, of which 16.3 were from automobile accidents; pneumonia 47.4; tuberculosis 39.7; diabetes mellitus 27.1; influenza 12.9; syphilis 10.3; diarrhoea and enteritis 7.3; appendicitis 5.5; and cerebrospinal meningitis 2.1.

For the first nine months of 1945, the record for the millions of industrial policyholders of the Metropolitan Life Insurance company, when compared with the like period for 1944, showed decreases in the death rates from the following causes of death: measles, scarlet fever, influenza, pneumonia, tuberculosis, syphilis, diabetes mellitus, the class "other chronic heart diseases," diarrhoea and enteritis, appendicitis, chronic nephritis, home accidents and occupational accidents. Increases were noted for cancer, cerebral haemorrhage, and diseases of the coronary arteries and angina pectoris. Death rates for the two years were substantially at the same level for typhoid fever, whooping cough, diphtheria, suicides, homicides and motor vehicle accidents.

The leading causes of death according to age, and their death rates per 100,000 population (white persons only) of the same ages in the U.S. during 1943 (the latest with details available) were: ages 1 to 4, all causes 232, pneumonia and influenza 47, accidents 51, diarrhoea and enteritis 14; ages 5 to 14, all causes 90, accidents 30, pneumonia and influenza 7, diseases of the heart 6; ages 15 to 24, all causes 176, accidents 68, tuberculosis 20, diseases of the heart 13; ages 25 to 44, all causes 318, diseases of the heart 53, tuberculosis 39, cancer 36; ages 45 to 64, all causes 1,396, diseases of the heart 462, cancer 250, intracranial lesions of vascular origin 113; ages 65 and over, all causes 7,132, diseases of the heart 2,782, intracranial lesions of vascular origin 873, cancer 857.

The principal causes of death from accidents in 1943 and their death rates per 100,000 population were: injury by fall 18.0; motor vehicle accidents 17.8; air transport accidents 5.3; drowning 4.5; burns (conflagration excepted) 4.4; railway accidents (except collisions with motor vehicles) 2.8.

In the brief period from 1940 to 1944, maternal mortality in the U.S. decreased by 39%, reaching a minimum of 2.3 per 1,000 live births in the latter year, with 6,369 maternal deaths being reported. In the same year, 1944, Canada reported 771 maternal deaths, with a rate of 2.7 per 1,000 live births, and England and Wales reported 1,168 such deaths, the rate being 1.6 per 1,000 live births. In 1943, the latest year with complete data for the U.S., there were 7,197 deaths from puerperal causes, the maternal mortality rate being 2.5 per 1,000 live births. Of the total puerperal deaths, 36.0% were from septicaemia, 26.9% from toxæmia and 15.6% from haemorrhage. Deaths during or after delivery accounted for 65.0% of the total, deaths before delivery for 14.2%, ectopic gestation for 4.6% and abortions for 16.2%. The maternal mortality rates per 1,000 live births in 1943 according to age of mother were: ages 10-14, 9.9; ages 15-19, 2.2; ages 20-24, 1.6; ages 25-29, 1.9; ages 30-34, 3.0; ages 35-39, 5.1; ages 40-44, 7.4. The white population had a maternal mortality rate of 2.1 per 1,000 live

births and other races a rate of 5.1. A study (*Statistical Bulletin*, Metropolitan Life Insurance Co., July 1945) showed that maternal mortality was lowest where hospital confinement was most frequent, namely in the Pacific coast states. The improvements from 1940-43 were most rapid in the southern and mountain states, which generally had the poorest records; these areas also had the smallest proportions of hospitalized births. In 1943, 77% of the white births in the country as a whole were hospitalized, but only 33% of the births of other races.

The expectation of life at birth corresponding to mortality conditions in the population within the U.S. in 1943 was 64.50 years, a reduction of one-third of a year from the high reached in 1942. The factors in this reduction are: the severe influenza epidemic in the closing months of 1943; the withdrawal of healthy males for overseas duty during the year; and the sharp increase in fatal accidents, particularly in military aviation. According to sex and race, the years of expectation of life at birth were: white males 63.16; white females 68.27; Negro males 54.65; Negro females 57.97.

Taking the mortality of married persons of ages 20 and over as a standard (U.S. bureau of the census, *Vital Statistics, Special Reports*, Vol. 23, No. 2), it was found, from 1940 records, that among males, the single had an excess mortality of 41% greater, the widower an excess of 92% and the divorced an excess of 115%. Among females, the single had a mortality 17% greater than the married, the widow 51% and the divorced 73%. (See also ACCIDENTS; CENSUS DATA, 1945; INFANT MORTALITY; SUICIDE STATISTICS.)

Source: Data from 1913 to 1945 are from U.S. treasury department, daily treasury statement (revised); 1946 estimated.

The Fifth, Sixth, and Seventh War Loan drives were held during the fiscal year 1945. Sales of securities were \$20,600,000,000, \$21,600,000,000 and \$26,300,000,000, respectively. The Victory Loan drive, the last great public drive to be held in connection with World War II, was opened in Aug. 1945 to run until the end of the calendar year. The goal was set at \$11,000,000,000 as against \$14,000,000,000 for the Seventh War Loan drive. The loan was oversubscribed, with sales of all types of securities reaching \$21,100,000,000. Sales to individuals totalled \$6,800,000,000, compared with the goal of \$4,000,000,000.

In conformity with the treasury policy of securing funds from

noninflationary sources, considerable emphasis was placed upon the sale of war bonds and stamps to individuals. As may be seen in Table II, the outstanding bonds in this category exceeded

Source: Daily statement of the U.S. treasury.

\$45,000,000,000 by the end of fiscal year 1945 and in the course of that year there had been a net increase of \$11,000,000,000 in savings bonds sales. Of this increase approximately \$8,000,000,000 was in the lower denomination E Series bonds, sales of which reached an all-time peak in the Seventh War Loan drive, after declining slightly in the Fifth and Sixth War Loan drives. As the volume of savings bonds outstanding rose during World War II, an increase in the amount of redemptions was to be expected. This occurred not only in dollar amount but also in the rate of redemptions. In June 1945, for instance, redemptions were 1.21% of outstandings, as compared with 1.04% a year earlier. It is likely that this increase could be accounted for by the sales pressure used in the war loan drives and the increase in the number of bond owners. In any event, the data indicate no serious lack of control over the redemption rate.

"THE LINE FORMS AT THE RIGHT." Darling of the *New York Herald Tribune* saw in 1945 a seemingly endless stream of postwar additions to the national debt

An important element in the sale of savings bonds throughout the war period was the widespread adoption of the pay roll deduction plan sponsored by the treasury. The peak in the numbers participating was reached in June 1944 when about 27,600,000 employees had \$540,000,000 of their pay deducted for the purchase of war bonds. During the fiscal year 1945 the total sale of bonds by this method was about \$6,000,000,000 out of total gross sales in this category of securities of \$11,600,000,000. With the beginning of a declining trend in employment in war industries the number of persons participating in the pay roll savings plan declined. In April 1945, for example, there were 2,200,000 fewer participants than in the same months of 1944. (See also WAR BONDS.)

A significant feature of the management of the public debt during the war was the low interest rate policy that was adopted and maintained by the government. World War II was financed at an average rate of interest of 1.8% on the securities issued, compared with an average rate of 4.25% on the securities issued to finance World War I. Interest rates during the war period rose only moderately above the level prevailing during the depression of the '30s, the highest rate for long-term market issues being 2.5%. As a special inducement to individuals to increase their savings and thus assist in the government's anti-inflation program, the interest rate on savings bonds if held to maturity was fixed at 2.9%.

For securities outstanding the computed annual rate of interest amounted to 1.94% in June 1945 compared with 2.26% in June 1942. As may be seen in Table II, the major factor in this decline was the proportionate rise in certificates of indebtedness and notes outstanding.

Although these securities carried a low interest rate, they were a popular outlet, because of their high degree of liquidity, for business funds being built up during the war. The large increase in the holdings of government securities by nonfinancial corporations during World War II is shown in Table III.

Table III.—Ownership of Government Interest-Bearing Securities  
(Billions of dollars)

	End of month		June 1940	June 1945
Total amount outstanding	47.9	256.8		
Total held by banks	18.6	105.7		
Commercial banks	16.1	83.9		
Federal reserve banks	2.5	21.8

stantially year after year because of the large increase in the debt total. From a figure of \$1,041,000,000 in the fiscal year

1940 actual interest payments for the fiscal year 1945 amounted to \$3,617,000,000.

**State and Local Government Debt.**—The figures on the debt of state and local governments, 1929-45, are shown in Table IV.

**Other Countries.**—Latest figures available for the national debt of leading countries are given in Table V. The debt of all belligerent countries rose precipitously in World War II and even some of the neutral countries had to increase government expenditures to an extent that made borrowing necessary. By and large, the one area of the world not subject to rising national debt totals during the war period was Latin America.

Table V.—National Debt of Various Countries

Country	Date of latest debt figures	Total debt in local currency* (1000,000)
<b>Africa</b>		
Egypt . . . . .	12/31/44	90.0 pounds

\*For approximate value of various currencies see *Exchange Control and Exchange Rates*.  
†Prior to Nov. 1, 1942, the official designation of the Brazilian currency unit was the milreis.

Because of the tremendous scale of military operations the national debt in the belligerent countries rose higher than in any previous war period. In the United Kingdom the national debt stood at £22,398,000,000 at the end of March 1945 compared with £8,301,100,000 in 1939. During this same period the Canadian national debt about tripled, to reach a total of \$11,298,000,000, while the Australian debt rose from £1,295,000,000 to £2,589,000,000. For most of the occupied countries little information on the national debt was available. However, some idea of the effect of war and occupation upon the finances of these countries could be gained from the case of France where the national debt rose from 352,210,000,000 francs in 1939 to 1,417,018,000,000 francs in the spring of 1944.

For Italy the available data showed an increase from 108,636,000,000 lire in 1935 to 653,000,000,000 lire in the summer of 1944. The national debts of the other axis powers were not released in complete form, but even the incomplete figures revealed huge increases. In Germany the national debt increased from r.m. 30,737,000,000 in 1939 to r.m. 351,000,000,000 at the end of 1944, while the national debt of Japan rose from 40,470,-

000,000 yen in 1942 to 75,555,000,000 yen in March 1944. (See also BUDGET, NATIONAL; GREAT BRITAIN; INCOME AND PRODUCE, U.S.; TAXATION.) (M. Gt.)

## Decorations, Medals and Badges—Military, Naval and Civil.

Although World War II was not officially declared over at the close of 1945, the United States was planning and providing recognition for its returning heroes.

Early in 1945 congress provided for a World War II service medal. No attempt was made at that time to qualify service nor to give the medal a name; however, on Oct. 25, 1945, the U.S. war department announced authorization of a World War II victory medal ribbon which was designed by Arthur E. DuBois, consisting of two double rainbows in juxtaposition separated by a central band of red bordered in white. This ribbon represented World War II by the two double rainbows. The World War I victory medal ribbon consisted of a double rainbow in juxtaposition 36 mm. in width and was created by the Interallied board which met in Paris in 1919, whereas the World War II victory ribbon was created for the United States armed forces. The design for the medal was to be announced early in 1946.

On Oct. 25, 1945, announcement was also made that all individuals having served in the armed forces within the United States were also authorized to wear the American campaign medal ribbon.

On July 6, 1945, the president signed executive order No. 9586 creating the medal of freedom for award to any person who on or after Dec. 7, 1941, performed a meritorious act or service which aided the United States in the prosecution of a war against an enemy or enemies and for which an award of another United States medal or decoration was considered inappropriate, or who had similarly aided any nation engaged with the United States in the prosecution of a war against a common enemy or enemies. This decoration was not to be awarded to a citizen of the United States for any act or service performed within the United States or to a member of the armed forces of the United States. It was designed by Thomas Hudson Jones. For grades of award, a bronze, silver or gold palm is added to the suspension ribbon of the decoration and to the service ribbon. The obverse shows the head of "Freedom" taken from the statue at the pinnacle of the capitol at Washington, D.C.

On July 2, 1945, congress passed a law for a Selective Service system medal to be furnished to those who gave their services to the draft boards, etc., for which no compensation was made. The first awards of this medal, designed by Thomas Hudson Jones, was to be made by the president of the United States on Jan. 21, 1946, when token awards would be made to one individual selected from each state. The obverse of this medal shows the seal of the Selective Service system. The ribbon is composed of blue and yellow.

Congress authorized in 1945 a U.S. antarctic expedition medal 1939-41, to be awarded to those who served with Admiral Richard E. Byrd. The design for this medal and ribbon had not been announced by the close of 1945.

The Coast and Geodetic survey was authorized by congress to have six ribbons to represent their service. DuBois also aided in the creation of these ribbons for: meritorious service, distinguished service, good conduct, defense service, Atlantic war zone, Pacific war zone.

The navy department created a commendation ribbon Jan. 11, 1944, but the military commendation ribbon, which is also green and white, was not announced until Dec. 18, 1945.

CONGRESSIONAL MEDAL OF HONOR was awarded to 28 veterans of the European and Pacific theatres by Pres. Truman on Aug. 23, 1945. Relatives and high ranking officials of the army and navy attended the ceremony at the White House

A U.S. war department exceptional civilian award decoration was approved Dec. 29, 1945.

On July 28, 1945, the medical badge was authorized by the U.S. war department to be furnished to those medical corps men of the army who had served in combat.

Among Great Britain's ribbons appeared:

- The 1939-45 star—blue, red, light blue
- The Africa star—yellow, red, yellow—in each yellow portion a stripe, one is dark blue—the other light blue
- The Atlantic star—a variegated colour ribbon starting with dark blue to white in centre and ending in green
- The air crew Europe star—black, yellow, light blue, yellow, black
- The Italy star—red, white, green, white, red
- The France and Germany star—blue, white, red, white, blue
- The Pacific star—red, dark blue, green, yellow, green, light blue and red
- The Burma star—blue, orange, blue, red, blue, orange and blue
- The defense medal—green, black, green, red, green, black and green.

**Defense Board, Economic:** *see* FOREIGN ECONOMIC ADMINISTRATION.

**Defense Communications Board:** *see* WAR COMMUNICATIONS, BOARD OF.

**Defense Research Committee, National:** *see* SCIENTIFIC RESEARCH AND DEVELOPMENT, OFFICE OF.

**Defense Transportation, Office of.** During the first half of 1945, or until V-J day, the Office of Defense Transportation continued to exercise its functions under executive order 8989, to enforce existing regulations affecting transportation, and to place new restrictions on highway, waterway and pipeline transportation in the United States. After V-J day it began a process of revoking and relaxing restrictions until only a few controls remained at the end of the year; at the same time the ODT personnel was reduced by successive steps foreshadowing the dissolution of the agency in 1946.

Until after V-J day the ODT carried on and secured popular support for a vigorous campaign to reduce civilian passenger travel in order to free railroad equipment for war-connected traffic. Rail equipment for heavy troop movements was also provided by the elimination of sleeping car runs under 450 miles; shortening of advance passenger space reservation time to 5

days, later changed to 14; assignment of about two-thirds of all Pullman sleeping cars to military use; and making all passenger coaches available for military use under ODT supervision.

In Oct. 1945, government possession and operation of the Toledo, Peoria and Western railroad, which had been operated by the ODT from early in 1942, was terminated. The Illinois Central railroad was taken into the possession of the government in Aug. 1945, following an unsettled labour dispute. However, the government directed the railroad management to continue operations in the usual manner.

To meet railroad manpower shortages on the west coast, the ODT joined with the army and other war agencies in a railway manpower recruiting campaign. Special deferments for railroad workers were obtained from Selective Service and the army released a number of experienced railroad workers.

The ODT, during the latter half of 1945, particularly after V-J day, lifted numerous highway transport restrictions and regulations governing certificates of war necessity, motor truck deliveries, inter-city buses, agricultural industry transportation, for-hire motor carriers, 35-mile an hour speed limit, automobile racing and the rationing of new commercial motor vehicles.

By Nov. 1, 1945, the ODT had returned to private operation all of the 103 midwest trucking lines it had taken over in Aug. 1944 to prevent disruption of service during the labour disputes. On Aug. 16, it terminated its control over more than 1,600 motor transportation lines in Chicago and vicinity, taken over for the same reason in May 1945. On July 8, 1945, the ODT relinquished possession and control of the Scranton, Penn., Transit Co., which was seized on June 16 after a strike.

The first half of 1945 saw large quantities of bulk commodities—petroleum and its products, iron ore, coke, grain and sulphur—moving on the nation's waterways under ODT supervision, as well as the building, under ODT sponsorship, of an additional fleet of steel tank barges.

During the entire war period inland waterways handled a grand total of 1,731,034,485 barrels of petroleum and its products, 345,835,040 tons of iron ore, 62,827,283 tons of limestone, as well as enormous quantities of coal, grain, sulphur and other bulk commodities. Termination of hostilities enabled ODT to remove completely its controls over inland craft.

The ODT during 1945 expedited liquid rail shipments by imposing extra demurrage charges on idle tank cars; by requiring daily telegraphic reports on the location and status of

every car and by requiring loading and unloading crews to work around the clock. ODT controls over the shipment of all liquids were lifted Sept. 20, 1945.

Under the War Production board's Controlled Materials plan which terminated Sept. 30, and the earlier Production Requirements plan, the ODT, as claimant agency for transportation reported that major transportation items produced during the three-and-one-half years ending June 30, 1945, included 1,082 steam, 1,741 Diesel electric, 38 electric locomotives; 155,002 freight cars, 1,200 troop sleepers and 400 kitchen cars; 181,146 trucks and tractors; 19,580 integral buses; 5,572,392 tons of replacement rail. Twelve hundred more troop sleepers and 400 kitchen cars were scheduled for completion by the end of 1945, and the production of 750 passenger cars—the first authorized after 1942—was scheduled to begin late in 1945 for completion by July 1, 1946.

The activities and personnel of the Office of Defense Transportation were sharply reduced immediately following the cessation of hostilities. Its remaining 103 district offices, 39 field offices and 8 regional offices of the highway transport department were closed in successive stages by Dec. 1, 1945. Fourteen railway department field offices were closed by November.

At the same time more than 23,000 special ODT advisory committees were dissolved. These committees, whose members numbered approximately 103,000, serving without compensation, co-operated with the ODT in gathering information, formulating policies, and executing various plans designed to secure the fullest utilization of all transportation equipment in the interest of the war effort.

By Jan. 1, 1946, all wartime controls on transportation were lifted except those necessary to provide adequate rail transportation for troops being returned from the European and Pacific theatres of war. The ODT was scheduled to be fully liquidated by June 30, 1946. (See also ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; RAILROADS.) (J. M. J.)

### Deland, Margaretta Wade (Campbell)

(1857-1945), U.S. writer, was born Feb. 23, at Allegheny, Pa. Her works, set in Maine or Pennsylvania backgrounds, first received wide attention with the publication of *John Ward, Preacher* (1881), which stirred the reading public of two continents into protest against its supposed irreligion. The honour of becoming one of the first women to be elected to membership in the National Institute of Arts and Letters was bestowed upon Mrs. Deland in 1926. Her works include *The Old Garden*, verse (1886), *Around Old Chester* (1915), *The Kays* (1926), *Captain Archer's Daughter* (1932), *If This Be I (As I Suppose It Be)* (1935) and an autobiography, *Golden Yesterdays* (1941). Mrs. Deland died in Boston, Jan. 13. See *Encyclopædia Britannica*.

**Delaware.** Delaware is on the middle Atlantic seaboard and is one of the 13 original states. The state is popularly called the "Diamond state" but it is also known as the "First state," having been the first, on Dec. 7, 1787, to ratify the federal constitution. Area 2,399.2 sq.mi. (land 1,961.7; inland water 437.5). Population (1940), 266,505, of which 139,432 were urban and 127,073 rural. Native white numbered 215,695; foreign born 14,913; Negro 35,876. The principal city is Wilmington, 112,504 (1940), and Dover is the capital with a population of 5,517 (1940). On July 1, 1944, the bureau of census estimated the civilian population of the state at 283,802.

**History.**—Soon after V-J day World War II production

terminated and reconversion began. The state council of defense and other wartime agencies finished their work and Forts Delaware and duPont, which had long guarded the shipping lanes of the vital Delaware river area, were closed by the war department. Despite the fact that construction and other peacetime industries absorbed a number of employees, factory employment decreased 22% and pay rolls dropped about 18% after V-J day. Most of the loss of employment was in the shipyards and machine shops of the Wilmington area. The housing situation was critical throughout the state and there was an acute shortage of men's clothing which was accentuated by the returning veterans. Delaware's nearly 30,000 men and women in the armed forces were returned to civilian life at the rate of about 1,000 per week during the last three months of 1945. During the closing months of 1945, food prices were 0.4% higher, and fuel and light costs increased 0.5% over the corresponding period of 1944. Wholesale and retail sales were approximately 5% and 10% respectively greater than in the previous year. Marriages and deaths in the state were less during 1945 than in the previous year but births amounting to about 6,300 for the 11-month period increased 5%.

The state legislature met in January and continued in session for 60 legislative days. Among the principal enactments were: establishment of the family court; modification of election and banking laws; inauguration of state pension system; and an act for a Delaware river crossing. The governor was Walter W. Bacon; U.S. senators, C. Douglass Buck and James M. Tunnell, Sr.; congressman, Philip A. Traynor; secretary of state, William J. Storey; adjutant general, Paul R. Rinard; attorney general, Clair J. Killoran; and W. Watson Harrington, chancellor. Charles S. Richards, formerly resident judge of Sussex county on the state supreme court, became chief justice and James B. Carey succeeded him as resident judge.

**Education.**—In the 127 elementary and 46 secondary schools there was a total enrolment of 42,315 during 1945. Despite a critical shortage of teachers the staff of 1,589 was maintained through the use of teachers with temporary certificates. The percentage of such certificates (outside of the city of Wilmington) was 15% during 1945 as compared with 11% for the previous year. None of the state's schools were closed because of lack of personnel but it was necessary to discontinue some agricultural, physical education and manual training courses. Again the state board of education reappointed Dr. H. V. Holloway to the office of state superintendent of public instruction.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—There was a noticeable increase in the number of cases and the amounts spent for welfare during the first 11 months of 1945. Total expenditures for 3,817 relief cases were \$112,854.62; for 14,710 old-age assistance cases were \$272,052.21; and \$242,345.52 for 3,115 cases of aid to dependent children. Unemployment compensation payments totalled \$1,047,068.60 during 1945, of which \$210,288.00 was paid for 2,762 veterans' readjustment claims. Statistics for the state's penal institutions were not available.

**Communications.**—During 1945 there were 3,898.3 mi. of highways under state control. Expenditures during the year were \$3,076,997.17 as compared with \$2,621,161.08 in 1944. The federal aid contribution in 1945 was \$156,015.22 as compared with \$279,969.04 in 1944. There was an increase in traffic on the state highways of 22.73% during December of 1945 over that of the same month of the previous year. The railroad mileage was approximately 279. Water-borne commerce statistics were available for only the port of Wilmington and the Delaware and Chesapeake canal. The tonnage of the Wilmington marine terminal for the first 11 months of 1945 was 209,098 as compared with 610,671 tons during the same period of 1944. The tonnage

of cargo handled through the Delaware and Chesapeake canal dropped from an all-time high of 5,449,024 in 1944 to 3,645,915 tons in 1945. The 12 airfields of the state were either under control of the armed services or were closed to civilian traffic. As of Oct. 31, 1945, there were 69,605 telephones in use throughout the state.

**Banking and Finance.**—There were 42 state banks, mutual savings and trust companies in operation during the fiscal year 1944-45 with resources of \$493,276,718.52, an increase of \$45,006,521.32 over the previous year. The deposits amounting to \$443,360,368.98 increased by \$42,699,102.91. The 13 national banks had resources of \$39,081,601.15 and deposits of \$34,411,042.92 respectively. The 39 building and loan associations had resources of \$16,014,115.53, an increase of \$858,296.43. The state budget (fiscal year 1944-45) was \$8,945,422.86, the receipts \$13,875,482.07 and the expenditures \$11,520,782.45. The gross debt of the state was \$4,481,000.

**Agriculture.**—The total value of all agricultural production (Jan.-Oct.) amounted to \$71,224,000. Of this sum \$12,462,000 was the value of the crops and the livestock was valued at \$58,762,000. The estimated value of crops for all of 1945 was \$18,899,000. In addition to these figures the production of the broiler industry was estimated to be between \$55,000,000 to \$60,000,000 as compared with an estimated \$47,693,000 in 1944. Government payments are not included as they were not available. Fruit crops were unfavourably affected by an early warm spell followed by a freeze just as fruit was blossoming. The wet period in July caused a considerable loss in yield of tomatoes as well as loss in other truck crops. Some grain was lost during this period. The season was generally good for grain and hay.

Table I.—Leading Agricultural Products of Delaware, 1945 and 1944

Crop	1945	1944
Corn, bu. . . . .	4,224,000	3,645,000
Apples, bu. . . . .	308,000	870,000
Hay, tons . . . . .	109,000	97,000
Wheat, bu. . . . .	1,306,000	1,280,000
Tomatoes, tons . . . . .	30,000	64,000
Strawberries, crates . . . . .	44,000	54,000
Lima beans, tons . . . . .	9,880	3,220

**Manufacturing.**—The total estimated value of manufactures for the Nov. 1, 1944, to Oct. 31, 1945, period was \$220,257,162.04. Total employment statistics for the whole state were not available but 456 plants of the Wilmington industrial area reported a decrease of 9,345 employees as of Nov. 15, 1945, when total employment was 51,966 as compared with 61,311 for the same time in 1944.

Table II.—Principal Industries of Delaware, 1945 and 1943

Industry	Value of products	
	1945	1943
Chemicals . . . . .	\$43,203,298.91	\$22,333,203.62
Shipbuilding . . . . .	63,294,890.65	57,213,700.04
Leather . . . . .	11,501,630.82	8,510,131.61
Foundries, machine shops, tools . . . . .	33,603,377.62	35,454,394.14
Fibre . . . . .	24,407,180.44	2,988,317.81
Textiles . . . . .	35,603,254.65	35,070,462.60
Canning and packing . . . . .	872,732.09	1,216,774.15

**Mineral Production.**—The chief products, building stone, granite, sand, brick and clay products, had a total value of \$203,705.06 (Oct. 31, 1945) as compared with \$320,409.82 for the same period of 1944. The termination of federal construction and the lag in civilian building due to lack of other supplies was reputed to be the cause of the decrease.

**Democracy.** Democracy is not only a technique of government, based upon freely elected representative institutions, and upon an executive responsible to the people; it presupposes also the belief in the dignity of every individual and his inherent rights to freedom of thought and expression. It

rejects all totalitarian forms of government and recognizes spheres of individual freedom, protected by law against government interference. Democracy demands a spirit of tolerance and compromise which emerges in the interplay of several parties, in the free discussion of various viewpoints.

In the year 1945 democracy reasserted itself and began definitely to overcome the long period of distrust which had set in after World War I. The victories of the United States and of Britain against the fascist powers strengthened the faith and confidence in democracy. In the countries of western and northern Europe, civic liberties, equality of all before the law, and a due regard for objective justice were quickly re-established and fascist legislation abolished. In France, Belgium, the Netherlands, Luxembourg, Norway and Denmark the democratic institutions were again functioning in 1945. Greece enjoyed complete liberty of press and of assembly by the end of the year and democratic elections in which all parties could compete were scheduled for spring 1946. Full freedom of these elections was assured.

Wherever such freedom of elections was assured and opposition candidates could present themselves at the polls, the elections held confirmed everywhere the trend away from all forms of totalitarianism to democracy. This was the more remarkable because all these countries suffered from an unprecedented economic misery and from much administrative chaos in the wake of the long years of war.

Free elections in which opposition parties were represented were held in 1945 on the European continent in France, Luxembourg, Norway, Denmark, Finland, Austria and Hungary. In Norway and in Denmark, as in Great Britain, the moderate socialist or labour parties gained the strongest representation; in Norway the labour party received the absolute majority and formed the government; in Denmark the bourgeois parties of the centre and the right received 83 seats against 47 for the Social Democrats and 18 for the Communists. In Luxembourg the Catholic party received most of the votes; together with the Social Democrats they had 34 out of 51 seats and formed the government. In Finland the bourgeois parties received about one-half of the votes, the Social Democrats one-fourth and the Communists one-fourth. The same proportion prevailed in France, where the Communists, the Social Democrats, and the Catholic republicans emerged as the three strongest parties. In Austria and in Hungary the Catholic Agrarian parties received a clear majority of the votes and seats while the Communists lost heavily, especially in Austria. On the whole, the trend on the continent of Europe, wherever full freedom of expression and election existed, went to the two democratic parties of the centre, the Progressive Catholics and the Social Democrats.

In Britain the Labour party received 393 out of the 640 seats in the house of commons. The popular vote was not so overwhelmingly labour as the distribution of the seats might suggest. Labour received 11,962,678 votes, the Conservatives 9,018,235 and the Liberals 2,280,135 votes. The radical parties of the left made a very poor showing: Commonwealth received 1 seat; the Communists 2 seats, a gain of 1.

Outside the countries where democracy had a long established tradition, democracy was at least recognized as a desirable goal. That was also the case in the soviet union and in China. In Brazil, free presidential elections were held. General Enrico Gaspar Dutra, the president-elect, wished Brazil's forthcoming constituent assembly to draft a "completely democratic" constitution after the model of the United States. In Venezuela a revolution under Romulo Betancourt proclaimed its democratic aims directed as much against the dictatorship of entrenched wealth as against the totalitarianism of communism. Thus after 20 years, when under attack from communism and fascism the

prestige of democracy had been falling, the year 1945 witnessed everywhere a new rise in the appreciation of the freedom and dignity, of the results and benefits of the democratic way of life. (H. Ko.)

**Democratic Party.** The Democrats at Washington shifted from a war-making to a peace-making and reconversion administration throughout most of 1945, and promptly discovered that postwar problems presented greater difficulties, politically, than repelling the axis threat against the "democracies" of the world.

As the year ended, international differences suppressed during the war emergency beset President Harry S. Truman, who succeeded Franklin D. Roosevelt on April 12. Labour strife swept the country, based on the unions' demands for higher wages. Republicans and conservative Democrats inside and outside congress, released from the pressures and restraints of the win-the-war spirit, combined to block Truman's major proposals for social, labour and economic reforms on the domestic front.

The prolonged stalemate between the White House and Capitol hill gave deep concern to Democratic political strategists, who conceded that the administration's lack of accomplishment in the months after V-J day might affect adversely their chance of holding a congressional majority in 1946 and Truman's own prospect of election in 1948. They were especially fearful of resentment among the various powerful voting blocs—labour, liberal, racial—which had enjoyed so many benefits under the Roosevelt regime, and demanded more of the same from his successor.

The president's legislative reverses derived from an active and avowed alliance of southern conservatives and Republicans. Even before the United States entered the war in 1941, these conservatives and Republicans had begun to oppose Roosevelt's more advanced program, but, as new domestic reforms were forgotten or withdrawn during the military crisis, they had become quiescent.

With the return of peace, these conservatives and Republicans reasserted their opposition even more violently and effectively. Moreover, to their surprise, they discovered that Truman was fully as "New Dealish" as his predecessor, whereas they had anticipated that the former senator and vice-president would be more restrained in his demands on them for legislation.

Toward the close of 1945, the exasperated Truman indulged in sharp criticism of his former colleagues, accusing them over the radio and in press remarks of "letting him down" and "stalling" on his reconversion program. His accusation did not improve relations, and his own leaders rebelled. It also enabled the opposition to charge that the Democrats were so hopelessly divided that their own president had to castigate them—an indictment which the Republicans did not fail to make.

A year-end headline in a Washington, D.C., newspaper aptly described the relationship between president and congress: "Congressmen still call him 'Harry,' but block most of his plans." Presidential "must" proposals that were blocked or sharply modified during 1945 included the following: compulsory universal military training; a labour disputes fact-finding agency with provision for a 30-day cooling-off period before a strike; a broad public health program; domestic control of atomic energy; unemployment compensation expansion; a full employment bill; a minimum wage increase measure; a permanent Fair Employment Practices committee; federal aid for housing and slum clearance.

Even the grants which congress gave him fell short of the president's original requests, but he accepted them. The legis-

lators authorized him to reorganize the government departments, but with less sweeping power than he asked. They extended the Second War Powers act until June 30, 1946, whereas Truman had requested a year's extension. They passed a \$6,000,000,000 tax reduction bill, but it differed sharply from the treasury's recommendations.

President Truman fared better with respect to action on his foreign proposals, but in this instance most of them had been advanced by Roosevelt before his death. The lawmakers committed the U.S. to membership in the United Nations organization with authority for that body to employ U.S. forces to preserve world peace.

Congress also provided for expansion of the Export-Import bank. It authorized creation of an International Bank for Recovery and Development and an International Monetary Fund. It appropriated funds to complete the U.S. contribution to the United Nations Relief and Rehabilitation administration.

National Chairman Hannegan, and presumably President Truman, were particularly disturbed over Democratic leaders' opposition to legislation benefiting labour and racial elements in the electorate. The proposal to establish a statutory FEPC, which was designed to bar employment discrimination based on colour, creed or national origin, was held up by a few southern Democrats in the Rules committee. Their failure to act promptly, despite Truman's intervention, made restless the prospective beneficiaries in large industrial centres.

Labour legislation (the full employment and the expanded unemployment compensation bills) was shelved by Rep. Carter Manasco of Alabama and Rep. Robert L. Doughton of North Carolina—chairmen, respectively, of the House Expenditures and Ways and Means committees. Punitive bills, imposing financial penalties on striking unions and depriving them of Wagner act benefits under certain circumstances, were sponsored by Rep. Howard W. Smith, an old-line Virginia Democrat.

These evidences of anti-labour feeling among administration leaders, together with Truman's suggestion for a 30-day cooling-off period before a strike in key industries, caused the first rift between a Democratic president and the Congress of Industrial organizations in 13 years. President Philip Murray characterized Truman as an "enemy of labour"—a remark which surprised some of his own associates. John L. Lewis, president of the United Mine Workers, was equally caustic.

These possibly prophetic signs of unrest forced National Chairman Hannegan to intensify organizational efforts in preparation for 1946 and 1948. He made more trips and speeches; he shook more hands, and he visited more state and local leaders than any predecessor save James Aloysius Farley.

Hannegan expanded and reorganized the publicity bureau. He selected Sam A. O'Neal as director of publicity to succeed the ageing Charles A. Michelson. O'Neal, a veteran Washington correspondent for St. Louis and Chicago newspapers, took to his typewriter and to the road more frequently than any party publicist since the early days of the New Deal.

Organization Democrats and party bosses enjoyed more patronage under Truman than they had under Roosevelt, due largely to Hannegan's promptings. The national chairman obviously relied on the four-times-successful Roosevelt formula for future triumphs at the polls—a combination of the solid south, the labour and racial vote in great metropolitan centres and the political machines in key cities of the northeast and midwest.

The Democratic leadership on Capitol hill underwent a few changes during 1945. When Truman quit the vice-presidency, Sen. Kenneth McKellar of Tennessee was elected president pro tem of the senate. Sen. Alben W. Barkley of Kentucky remained as majority leader, with Senator Lister Hill of Alabama as his assistant.

Sam Rayburn of Texas continued as speaker of the house of representatives, and John W. McCormack of Massachusetts as majority leader. Rep. John J. Sparkman of Alabama was named as McCormack's aide. He succeeded Robert Ramspeck of Georgia, who resigned to accept a private position.

Deaths, defeats and resignations in 1945 lowered the Democratic membership in both bodies. In the senate their number had dropped from 58 to 56 at the end of the year, while the Republicans increased from 37 to 39. The Progressives had one seat—Robert M. La Follette, Jr., of Wisconsin.

In the house the majority lost five places, slipping from 241 to 236. The Republicans held their own at 190. There were two members of minor parties—one Progressive and one American Labour—and seven vacancies.

(R. Tu.)

## Dempsey, Sir Miles Christopher

(1896– ), British army officer, was born Dec. 15 in Cheshire, England. He left the Shrewsbury school in 1914 to enter World War I and joined the Royal Berkshire regiment as 2nd lieutenant in 1915. He served in France, Belgium and Iraq. In 1921 he became a captain, in 1932 a major, and was promoted to lieutenant colonel in 1938. He won his first renown in the famous rear-guard action which enabled the British to evacuate hundreds of thousands of troops from Dunkirk in May 1940 during World War II. He distinguished himself again when, as acting lieutenant general, he commanded the famous 13th corps of Gen. Montgomery's 8th army which chased Rommel across Africa from El Alamein to Libya late in 1942. In 1944 he went to Normandy as commander of the British ground forces in the invasion of France, for which he was knighted after D-day. Dempsey's British 2nd army entered Germany for the first time, Jan. 16, 1945. Operating with the Canadian 2nd army, his force later helped to cut the escape route for German forces in the Netherlands. In March, Dempsey's 2nd army reached the Rhine and crossed the river near Wesel. As the war in Europe ended, Dempsey's forces were deep in north Germany:

**Denmark.** A monarchy of north central Europe. Area, 16,575 sq.mi.; pop. (est. 1940) 3,844,312. Capital: Copenhagen (700,465). Other principal cities: Aarhus (99,881); Odense (87,521); Aalborg (55,652). Religion: Lutheran Christian. Ruler in 1945: King Christian X (*q.v.*); prime minister after the liberation from German rule, May 4 to Nov. 3, Vilhelm Buhl; after the fall elections, Knud Kristensen.

**History.**—The last months of World War II built up to a crescendo of terror and sabotage in Denmark. Gasoline depots were blown up, factories making things for the Germans were destroyed, a great explosion wracked the cruiser "Nuernberg" lying in Copenhagen harbour; but most important of all was the utter disintegration wrought upon rail transportation, stopping the flow of food, materials and soldiers through the country. Hitler's last birthday was celebrated grimly in Denmark by blastings of bridges and rail switches every four minutes. Altogether the Danes counted up 8,350 cases of railway blowups in the five years of war. Major acts of sabotage were numbered as: 1940, 25 acts; 1941, 100; 1942, 280; 1943, 820; 1944, 930; 1945, 680 (four months). These acts were carefully planned, co-ordinated through the Danish Freedom council and aided in various ways by materials and information flown in from Britain. The effectiveness of the program was signaled by a special bulletin of appreciation to the Danes from Gen. Dwight D. Eisenhower. Secret armed forces at the time of the German surrender numbered 55,000. During the war years about 225 illegal underground papers were published, total

MEMORIAL of flowers and Danish flags mark the place in Copenhagen where a Danish patriot was killed. The city was liberated in May 1945

copies issued in 1944 numbering 12,300,000. In addition about 1,100,000 underground books were published, their sale helping support the "fight for freedom."

In general Denmark suffered less than most of the occupied countries. Hitler had hoped to make it his "model protectorate" and Germany needed all the food production it could get from friendly co-operation. Yet Danish resentment at the attack on its freedom brought inevitable reprisals. As the result of the occupation, 3,006 Danes died; of these 1,281 were sailors in the merchant marine. During the war 41 Danish ships sailed for the U.S.; only 17 survived. In June there were 78 ships ready to return from British to Danish registry; another 71 ships were lost in British service. Within the country the war-incidence of disease increased tragically the cases of tuberculosis, meningitis, scarlet fever, diphtheria and venereal diseases. The presence of about 350,000 war refugees complicated social and housing problems.

Denmark watched eagerly the vast pincers movement closing in on Germany in April 1945. Germans began to leave Denmark on May 1, but the movement then slowed, and only on May 4 was it formally announced that they would surrender to Gen. Bernard L. Montgomery. Some Danish prisoners, freed by the negotiations of Count Folke Bernadotte, reached home on May 2. Once under way the German disintegration was rapid, and the Danes quickly took charge of their government. Field Marshal Montgomery was feted in the capital and decorated with the Order of the Elephant. On May 4 King Christian X asked the former premier, Vilhelm Buhl, to form a cabinet, and on May 9 the old Rigsdag reassembled. Fritz Clausen, leader of the Danish Nazi party, and K. B. Martinson, chief of the former Schalburg corps, were arrested. Princess Helena, wife of the king's brother, Prince Harald, was expelled from the country with the king's approval because of her pro-German activities during the war. The people demanded vigorous prosecution of all collaborators and war criminals. But the Freedom council, the wartime political executive, held its only meeting "above ground" and its last on May 9.

Eager as was Denmark to participate in the discussions creating a new world organization, it could not at first do so

because it was not in a legal state of war with Germany and because there was not an official Danish "government-in-exile." As soon as liberation made it possible, the Danish government sent a delegate to the San Francisco conference, and by a special polled vote Denmark was admitted to the conference as the 50th country—June 5, 1945. On Sept. 11 the government ratified the United Nations agreement.

The old question of the Slesvig (Schleswig) boundary inevitably recurred, though most Danish leaders professed a desire to leave the line where it had been fixed by the plebiscite at the close of World War I. Anxiety grew, however, as some 300,000 Germans, displaced from the eastern areas of Germany, crowded into the German part of the duchy, creating there a strong population pressure. Because of its central geographic position, Denmark found itself liberated largely by the western Allies, but in the island of Bornholm, by the Russians.

In the Faeroe Islands the British wartime occupation withdrew and the Danes became busy with plans for reintegration of the region with Denmark. Iceland's final separation from the Danish crown was of course accepted. A ship was sent out to Greenland to thank the U.S. personnel and to greet and re-establish contact with the islanders. The U.S. army air force weather service offered to give Denmark four of the weather stations built in the Greenland area.

The elections of late October were notable in several respects. In the last elections, in 1943, the Germans had not permitted the Communists to enter the race, and the party leaders were arrested. In 1945 the government decided it was only fair to aid the Communists to re-establish themselves, hence loaned them 750,000 kroner (1 krone=19.308 U.S. cents in 1940) for organization and publication. The Communists won 18 seats in the lower house of the Rigsdag, but the Social Democrats won only 48 (down 18 from the 1943 figure), hence the left wing was left with the same number of seats. The Liberals increased their representation from 28 to 38, the Conservatives dropped from 31 to 26, the Radicals from 13 to 11, the Georgists increased from 2 to 3 and the Nationalists (Centre) from 3 to 4. The slight gain for the right wing caused the coalition premier, Social Democrat Vilhelm Buhl, to resign. On Nov. 3 the king asked the Agrarian (Liberal) leader, Minister of the Interior Knud Kristensen, to form a government. The election of course brought a pause in the nationalization program, but left the total situation still unclear.

**Education.**—In 1940 there were 407,355 students in the elementary schools and 67,064 in the middle and secondary schools. In the two Danish universities 6,474 students were enrolled. Even during the war about one-third of Denmark's famous folk high schools continued to function.

**Economic and Financial Conditions.**—Agricultural production was down only slightly in 1945, and Denmark was eager to resume export of foodstuffs on a large scale. Sympathy for the plight of the Netherlands led to a gift of 250,000 eggs and more than 200,000 lb. of oatmeal and other foodstuffs. Regular commerce recovered slowly, however, because of the disruption of traffic and finance elsewhere. Denmark negotiated by Sept. 1 a number of trade agreements with Sweden, Poland, Great Britain, Norway, Belgium and Luxembourg; and also a \$20,000,000 credit with the U.S., interest at 3½%, payable by 1966. This credit was to be used for the following purchases in the U.S.: iron \$4,000,000; yarn \$2,000,000; coal and oil \$4,000,000; tobacco \$1,280,000; chemicals \$1,000,000; plus quantities of synthetic rubber and manufactured tires. Sweden also extended loans or credits to a total sum of 230,000,000 kroner.

In order to regain control of its currency and to check inflation and profiteering, the government required the exchange of all notes issued prior to 1943 for new notes. Concern was

profound because of the swollen note circulation and the inability to purchase needed supplies from abroad. (F. D. S.)

**Denny, Harold Norman** (1889-1945), U.S. war correspondent, was born March 11, in Des Moines, Ia. A former student at Drake university, he turned to newspaper work in 1913 and was a reporter and copy editor for papers in Des Moines, St. Paul and Minneapolis. When the United States entered World War I, he enlisted and fought in the Lorraine, Champagne, Aisne-Marne and the Meuse-Argonne battles. He joined the staff of the *New York Times* in 1922 and during the following 23 years covered wars and rebellions all over the world. He reported the Moroccan campaign in 1926, and saw action with the U.S. marines in Nicaragua in 1928 and in Cuba in 1930. Crossing the Atlantic, he reported the Ethiopian war, 1935, the Russian invasion of Finland, 1939, and the German blitzkrieg through France, 1940. After the fall of France, he was assigned to North Africa where he was captured in Nov. 1941 by Rommel's Afrika Korps which turned back Sir Claude Auchinleck's army at Halfaya pass. Denny was repatriated in 1942 and wrote a book of his experiences, *Behind Both Lines* (1942). He was in England again in preparation for the invasion of France and was with Gen. Courtney Hodges' U.S. 1st army in its advance to the Ardennes forest. He was on the spot when Aachen fell and witnessed the junction on the Elbe of U.S. and Russian troops. One of his most notable assignments was in Moscow, 1934-39, where he reported the treason trials and purges of 1936-38. His series of uncensored articles were the object of diplomatic protest. Denny died of a heart attack in Des Moines, July 3.

**Dental Association, American:** see AMERICAN DENTAL ASSOCIATION.

**Dentistry.** Dental infections both acute and chronic, long a serious problem, had previously been treated surgically, frequently with loss of teeth and other tissues. Fortunately the organisms ordinarily found in infections in the mouth are susceptible to penicillin.

Vincent's infection or trench mouth was exceedingly prevalent both in military and civilian life. In one review of penicillin treatment of this condition, 43 patients were treated with 25,000 units intramuscularly every three hours. All patients were cured. Fusiform bacilli and spirochetes were not detectable after 48 hours except in patients with dental caries. An evaluation of penicillin therapy at the National Naval Medical centre, Bethesda, Md., based on 1,455 cases treated, found that in stomatitis and Vincent's angina, treated with 20,000 units of penicillin intramuscularly every two hours for two or three days, "good results" were obtained. In another investigation patients with Vincent's infection were divided in four groups. Group one was treated with 3% chromic acid and 10% silver nitrate, preceded by gargling with equal parts of 50% sodium perborate and 50% hydrogen peroxide. The second group received 1-gm. doses of sulfadiazine used as lozenges every four hours. The third group was treated with penicillin applied on a swab every four hours in concentrations of 250 to 500 units per c.c. Group four patients were treated with penicillin intramuscularly. The patients in group three responded much more rapidly than those in groups one and two. It was concluded that the topical application of penicillin in a concentration of 500 units per c.c. four times a day is a rapidly effective therapeutic procedure in the treatment of Vincent's angina. Another report, however, indicated the high value of intramuscular injections for this condition.

Actinomycosis or lumpy jaw is not a common but a persistent and troublesome disease. That "penicillin is the most effective therapeutic agent we have in the treatment of actinomycosis" was the report made by two investigators (J. M. Walker and J. W. Hamilton, *Annals of Surgery*, March 1945 [Lippincott]). These investigators also reported favourable results in osteomyelitis, a serious infection of the bone.

In its early use, penicillin was administered either intramuscularly or intravenously, but injection directly into the infected area and administration by mouth were gradually gaining favour. In the opinion of one group, penicillin instilled locally results in a much higher concentration at the site of infection than that obtained in the blood with a corresponding higher percentage of favourable results.

The author of this article, in a series of 35 cases of acute and chronic infections of the jaws and supporting tissues of the teeth, found that penicillin in doses of 25,000 units injected directly into the infected areas three or more times brought remarkably favourable results.

Penicillin in agar pastilles dissolved in the mouth provides "the best form of therapy known at the present time" for the treatment of Vincent's infection, is the opinion of another group. The pastilles were placed between the gum and the cheek and were replaced every four hours.

By this method a therapeutic concentration of penicillin in the saliva could be maintained.

Haemorrhage has always been an occasional complication of surgery in the mouth which has a bountiful blood supply. Various agents had been used to control bleeding, one of the most effective being adrenalin, the active principle of the adrenalin gland.

During 1945 marked advances were made in knowledge of the various factors contained in the blood. As a result of the studies of Cohn of the Harvard Medical school, Cambridge, Mass., a substance called fibrin foam was developed for use in control of haemorrhage. In an article on the "Use of Fibrin Foam in Dental Operations," four cases were reported in which fibrin foam and thrombin were successfully used to control post-operative haemorrhage. Other reports, yet unpublished, indicated that this method of treatment should prove to be an important advance in the management of bleeding after dental operations.

The interest in fluorine as an inhibitor of dental caries developed further during 1945. The Massachusetts legislature authorized a study of this problem by the state department of health.

A program to interest dentists in the importance of fluorides in dental health was launched in New York in June.

**Dermatology.** A new cutaneous disease was the subject of many reports in the dermatologic literature during 1945. The disease occurred in military personnel stationed in the Southwest Pacific area, particularly on the island of New Guinea and adjacent islands. Most of the authors believed that it was due to the ingestion of quinacrine hydrochloride (atabrine); many were of the opinion that other factors such as avitaminosis were involved. J. W. Bagby called it a "lichen planus-like" disease. In the cases he studied the onset was variable; in some the eruption began as a true lichen planus, in others as a generalized erythematous eruption, in others large areas of pustules developed, which in healing were replaced by lesions resembling hypertrophic lichen planus. C. L. Schmitt, O. Alpíns and G. Chambers reported that the disease appears in two phases; the initial eruption mimicked such common dermatoses as heat rash, fungous infection, eczema, contact dermatitis and urticaria. This phase was followed by characteristic lesions which resembled lichen planus nodules or plaques and remained localized or became widespread, occasionally accompanied by an acute exfoliative dermatitis. These authors considered that treatment of the initial eruption with irritating ointments acted as a precipitating factor to the actual causative agent. After a comprehensive survey of many causes, T. W. Nisbet stated that the variable manifestations of this disease were confusing at first; later however it became possible to recognize it early and to differentiate it from other dermatoses because of certain characteristics. The course of this disease was characterized by periods of remission, and exacerbation and complete recovery rarely or never took place as long as the patient remained in the New Guinea area. All of the authors stated that the manifestations cleared gradually over a period of months, during evacuation to and after arrival in the temperate climates of the United States and Australia. Nisbet reported that only the mildest topical applications should be used in local treatment of these cases and that penicillin was useful in the treatment of the severe, generalized exfoliative and eczematoid forms in which secondary infection occurred.

A substance was synthesized which belongs to a new and distinct pharmacologic group of compounds. These substances are antispasmodics and at least one has a profound antihistamine effect. One of these synthetic compounds, called benadryl, which appears to have a low toxicity, was studied by A. C. Curtis and B. B. Owens in the treatment of urticaria. Eighteen patients with various types of urticarial eruptions were treated with this compound; 14 showed decided improvement. Benadryl is palliative only. Lesions similar to the original ones recurred promptly when the drug was discontinued. Preliminary studies seemed to indicate that it should be tried in the treatment of other types of allergic diseases. L. W. Shaffer, L. Carrick and H. S. Zackheim used benadryl for treatment of eight cases of urticaria with favourable effect in seven. They stated that it might offer valuable relief in the chronic type until investigation reveals the cause of urticaria and adequate control measures can be carried out. Acute cases responded favourably when the drug was administered. Results of its use in a variety of other diseases suggested that it is of no value for dyshidrotic eczema or neurodermatitis, but encouraging for cases of atopic eczema and lichen urticatus. Further trial of the drug in treatment of these diseases was indicated.

The treatment of various cutaneous diseases with penicillin was extensively studied and the results published. T. M. Cohen and R. O. Pfaff found that the drug was of value when locally applied in ointment form in impetigo contagiosa, folliculitis, sycosis barbae, so-called tropical ulcer and dermatophytosis secondarily infected with haemolytic streptococci. H. J. Templeton, C. E. Clifton and V. P. Seeberg used gauze impregnated

with penicillin liquid. They concluded that the drug was a valuable therapeutic agent in the treatment of pyogenic infections of the skin, particularly those of superficial type, such as impetigo. In more deep-seated infections, like sycosis vulgaris, surface application of the drug was of questionable value. Six cases of dermatitis herpetiformis were treated by C. C. Carpenter and W. H. Hall with penicillin administered intramuscularly. During the period of administration the disease improved but relapsed to pretreatment status within hours to days after administration of varying doses up to 1,000,000 units. Sixteen cases of actinomycosis, 11 of which were of the cervicofacial type, were treated by L. Dobson and W. Cutting; 8 were given penicillin and 8 received sulfadiazine. They stated that both drugs were highly effective in this disease but that sulfadiazine may be more effective than penicillin in many cases. John H. Lamb suggested that care be exercised in the treatment with penicillin of patients who have previously had an acute fungous infection of the feet, groins or hands, and reported two cases of an acute vesicular dermatitis of these areas in patients who were receiving this drug parenterally, with the dermatitis subsiding shortly after the drug was discontinued.

According to M. H. Saffron, cutaneous diphtheria is a common dermatosis in certain geographic areas where diphtheria is more or less endemic and climatic conditions are favourable. It was a military problem in these areas, particularly in the near and middle east, southern Europe, India and the coasts of Africa. Two forms of the disease occur; the rare acute variety, associated with nasal or faucial diphtheria, consisting of a solitary lesion, and the chronic form characterized by multiple indolent lesions which result from superinfection by *Corynebacterium diphtheriae* of pre-existing dermatoses. Both types may result in characteristic late postdiphtheritic complications, such as paralysis and toxic myocarditis. The recommended treatment is diphtheria antitoxin in fairly large doses, administered parenterally.

World War II added fresh importance to dermatophytosis and stimulated many investigations of this disease. Those of F. D. Weidman, J. G. Hopkins, C. W. Emmons and G. M. Lewis indicate certain changing concepts of the disease. Bacteria are gaining prominence as a cause of many cases of infectious intertrigo that have previously been considered mycotic in origin. They emphasized sensitization to local applications, trauma and long-standing hypostasis as a cause of dermatitis. The use of foot baths containing chlorine compounds was becoming discredited. More emphasis was laid on careful hygiene of the feet in prophylactic treatment. Evidence was submitted in the controversy whether dermatophytosis predisposes to contact dermatitis; this evidence indicated that it does not. This is of importance in adjudging disability claims, both civil and military. They proposed methods for standardizing fungicides and the clinical evaluation of them. For therapy, some of the older remedies, like Whitfield's ointment and boric acid were found to be of value, as were some of the newer fungicides, such as the fatty acids and their salts.

W. W. Duemling emphasized the high incidence of fungous infections of the skin and the severe exacerbation of the lesions of acne vulgaris which occurred in military personnel in tropical areas. He attributed such occurrences to the heat, humidity, crowded conditions and lack of proper bathing facilities in these areas.

In a comprehensive report on the status of poison ivy extracts, Johnson stated that the poisonous substance in at least one species of *Toxicodendron* is urushiol, the active factor in the sap of the lac trees of Japan, China and Indo-China. No accepted method of standardization of ivy extracts has been evolved. The treatment of the acute eruption with these ex-

tracts should be discouraged because many patients were made worse by such procedures and there was no satisfactory evidence that any were helped by their use. (See also MEDICINE.)

**Destroyers:** see NAVIES OF THE WORLD.

**Detroit.** Fourth largest city of the United States in the 1940 census, Detroit is the centre of the large industrial area of southeastern Michigan. Area, 137.9 sq.mi.; pop. (1940) 1,623,452 of whom 320,664 were foreign-born whites, British and Canadian ranking first with 110,698, and Polish second with 52,235. Pop. est. (June 1945), 1,685,000.

Assessed value as of June 30, 1945, \$2,906,345,890; gross bonded debt, \$313,491,739; net bonded debt, including utility debt, \$287,506,510; net tax supported debt, \$225,927,119; gross city appropriations, fiscal year ending June 30, 1946, \$193,972,593 including schools and utilities; tax levy, city and school purposes, \$85,510,509; combined city and school tax rate, \$29.42. Mayor, Jan. 1, 1946: Edward J. Jeffries, Jr., serving a third two-year term.

In a city whose industrial life depends so largely upon the automobile, events in this field were of first importance in 1945. The transition to a peacetime production was interrupted by major and minor strikes, the most important of which was the "economic blockade" by the C.I.O.-U.A.W. against the General Motors corporation, beginning late in 1945 but continuing into 1946. This strike was intended to isolate the corporation, leaving its competitors in production. However, the Ford Motor company was also seriously affected by strikes among its suppliers and the total output of cars for 1945 was greatly under schedule. The major strike raised the significant question of the determination of wages on the basis of individual corporation profits rather than by relationship to those paid in the industry as a whole. The refusal of the General Motors corporation to negotiate wages on the basis of profits became a question for congressional consideration. Contractual negotiations between the C.I.O.-U.A.W., the Chrysler corporation and the Ford Motor company were underway at the close of the year.

Additional competition in the automotive manufacturing field was projected by the formation of the Kaiser-Frazer corporation organized by Henry J. Kaiser, wartime shipbuilder, and Joseph W. Frazer, at times in charge of sales for the Chrysler corporation and the Willys-Overland company. This new organization acquired a lease on the government-owned Willow Run bomber plant, had close relations with the Graham-Paige company, and was expected to be in production by spring of 1946.

The C.I.O. Political Action committee was again active in the mayoralty and councilmanic campaign. For mayor a national officer of the C.I.O.-U.A.W. was successfully nominated but

was defeated in the election by the incumbent official. The campaign was marked by considerable bitterness. All candidates for the city council endorsed by the C.I.O. were defeated except one incumbent councilman.

In spite of heavy usage, the municipally owned street railway was operated at a loss, in part due to high wages and a relatively low fare. An increase to a universal fare of ten cents on both streetcars and busses was put into effect at the end of the year, over protests of the local C.I.O. and OPA, and court action was threatened.

(L. D. U.)

**Devers, Jacob Loucks** (1887- ), U.S. army officer, was born Sept. 8 in York, Pa. On his graduation from West Point in 1909 he was commissioned a second lieutenant in the field artillery. During World War I he served at Fort Sill, Okla., first as an artillery instructor and later as executive officer. As a division commander under Maj. Gen. Adna R. Chaffee, who built up the armoured force, he became experienced in the problems of mechanization. After Gen. Chaffee's resignation in 1941, Gen. Devers became commander of the armoured forces at Fort Knox, Ky., and was made a lieutenant general, Sept. 1942. He was appointed commander of U.S. forces in the European theatre of World War II in May 1943, and in December he was named deputy commander in the Mediterranean theatre. On Aug. 15, 1944, Devers commanded Allied landings in southern France. A month later, Sept. 15, Allied headquarters announced that he had been put in command of the 6th army group, consisting of U.S. and French units. Devers withdrew part of his forces from a salient in Germany in late Dec. 1944, during the German counterattack. This strategic retreat enabled him to consolidate his lines and contain the German drive. The 6th army group then participated in the all-out Allied offensive that ended in the collapse of the reich, May 7, 1945. Devers, who had been appointed to the temporary rank of a full general (March 13), became commander of the army ground forces, June 29. Testifying (Nov. 14) before the senate military affairs committee, Devers urged creation of a unified army-navy command, declaring that he would be willing to serve under a navy man if one were appointed chief of staff to a civilian secretary.

**Diabetes.** In 1943 the diabetic death rate in the United States reached its peak, 27.1 per 100,000 with 36,314 deaths, constituting 2.48% of the total deaths or one death from diabetes in each 40 deaths, in contrast to 1:182 in 1900, 1:100 in 1910, 1:60 in 1930. In rank among causes of death, excluding accidents, it was seventh. But there were wide variations among the states, thus ten (New York, Rhode Island, Pennsylvania, Vermont, New Hampshire, Massachusetts, Delaware, New Jersey, Connecticut and Ohio) with the highest mortalities averaging 38.8 were offset by ten (Arizona, New Mexico, Arkansas, Alabama, North Carolina, Georgia, Tennessee, Nevada, South Carolina, Texas) with the lowest, whose average mortality is less than one-third as great, 12.2 per 100,000. Such a great difference in death rates appeared improbable in the light of a survey of the incidence of living diabetics in Arizona, which showed it to be essentially the same as in the states with the high mortalities. Estimates upon the number of living diabetics in the United States vary between 657,000 to 1,000,000.

In the Latin-American republics the death rates from diabetes ranged from 15 per 100,000 for Buenos Aires in 1943 and 9.8 for 21 capital cities in Brazil (based on 1941 population) to 2.1 per 100,000 for Nicaragua and even below this level in several others. In England and Wales the provisional rate for 1944 was 9.6, but for Canada in 1942 was 19.3 per 100,000.

Alloxan claimed the attention of investigators during 1945 in 25 laboratories and in 8 different countries. Devised tests for alloxan allow its recognition and demonstration in the pancreas within five minutes after injection and its presence has also been noted in normal animal tissues. Various alloxanlike substances in addition to alloxantin act similarly to it, but its action can be prevented by neutralization or solution in either rabbit or human blood and by previous injection of various chemicals. Although alloxan acts with great rapidity and specificity and in five minutes causes necrosis of the beta cells of the islands of Langerhans, it was shown the same effect can be produced by repeated small injections over periods of weeks and in this way more closely simulates the onset of diabetes in humans. The development of cataracts in alloxan diabetic animals was confirmed. Various birds do not develop diabetes as a result of injection of alloxan, but pigeons show hyperglycaemia with occasional hydropic degeneration and ducks a partial necrosis of the islands. In many diabetic pigeons a deposit, identified as sodium urate, was observed in the pericardium, pleura and liver suggesting a resemblance to visceral gout in humans. A high fat diet abolished glycosuria in alloxan diabetic rats. An admirable and exhaustive review and comparison of the pathology of the pancreas in experimental diabetes produced by pancreatectomy, injections of anterior pituitary extract and alloxan was prepared by G. L. Duff. He was of the opinion, shared by several but not by all, that "it is most improbable at present that alloxan plays a role in the aetiology of human diabetes." B. A. Houssay and his co-workers also discussed and in some ways dissented from existing explanations of the hyperglycaemia and hypoglycaemia which follow injections of alloxan and have added new evidence.

An epoch-making preliminary announcement was made upon the point of attack of insulin in the conversion of glucose to bodily needs by W. H. Price, C. F. Cori and S. P. Colowick. They showed that the first step in the utilization of glucose by animal tissues, the reaction of adenosine triphosphate with glucose to form glucose-6-phosphate and adenosine diphosphate is inhibited by anterior pituitary extract. This inhibition is demonstrated in phosphate-saline extract of various rat tissues (muscle, liver, kidney, heart, brain) either by injecting rats with anterior pituitary extract (A.P.E.) prior to the preparation of tissue extracts or by adding A.P.E. to the enzyme preparation *in vitro*. The enzyme inhibited by A.P.E. is hexokinase.

Rats made diabetic by the injection of alloxan yield tissue extracts which show the same enzyme activity curves as those obtained from rats previously injected with A.P.E. The brain is an apparent exception, since brain extracts prepared from rats injected with alloxan or with A.P.E. do not show an inhibition of hexokinase activity. Brain extracts can, however, be inactivated by addition of A.P.E. *in vitro*.

The conversion of glycogen to lactic acid in muscle extract is not inhibited by A.P.E. When oxygen consumption is measured in a dialyzed liver dispersion, oxidation of glucose is inhibited by A.P.E., while that of fructose-6-phosphate and of pyruvate is not. (From W. H. Price, C. F. Cori and S. P. Colowick, *Journal of Biological Chemistry*, Oct. 1945.)

Insulin releases hexokinase from the A.P.E. inhibition either *in vivo* or *in vitro*, but insulin by itself does not enhance hexokinase activity. When insulin is reduced by cysteine, it no longer exerts its antagonistic effect against A.P.E. inhibition of hexokinase activity. The implications of this work seemed to be far-reaching and the promised subsequent reports by the authors were awaited with the greatest interest.

Among the outstanding papers published during 1945 was one on *The Use and the Abuse of Glucose in the Treatment of Diabetic Coma*. The mortality was 1.5% with the prompt administration and concentration of insulin in the first three hours, in contrast to 18% when approximately the same dose was spread over 12 hours.

Diabetic neuropathy or neuritis in its manifold forms de-

serves especial comment because of its frequency in the growing number of diabetics undergoing treatment whose lives have often been prolonged almost solely by the grace of insulin, despite a lack of reasonable dietetic control. It is refreshing to read R. W. Rundles' careful and detailed report of 125 cases and of the literature and to note that he could write that none of the group was found to be among "those regularly attending our diabetic clinic or under the adequate supervision of competent physicians with provision for enlightened dietary management and check-up visits" (*Medicine*, May 1945 [Williams and Wilkins Co.]). Rundles' critical analysis and study of the problems of diabetic neuropathy is so complete that his paper certainly ranks in the first ten of all the contributions to diabetic literature in 1945. An excellent editorial summary of it exists.

One of the encouraging signs of the awakening of physicians and the public to the seriousness of the diabetic situation was the establishment of the American Diabetes association, a counterpart to the one already existing in England, whose secretary in 1945 was Dr. Cecil Striker of Cincinnati, O., and the development of state and local societies and of diabetic camps. Each year the influence of these various activities advanced and already in several cities diabetic foundations were being created. An endeavour was made to interest the many rather than the few in these enterprises. In one city more than 600 patients contributed to a diabetic fund and more than 3,000 for the enlargement of a local hospital in order to provide more beds and additional laboratory space. **Diamonds.** To those who are accustomed to think of diamonds in carats, it may come as somewhat of a shock to learn that an important part of materials for World War II was approximately 11 short tons of industrial diamonds that were imported into the United States during 1939-44. Furthermore it is probable that this relatively small tonnage of material directly or indirectly had some part in the production of more equipment and contributed more toward the winning of the war than the same weight of any other material, including the uranium that went into the production of atomic bombs. Incidentally, this weight of industrial stones was considerably more than the total output of industrial stones during that period, the surplus requirements each year having been drawn from stocks accumulated in prewar years, but which were practically exhausted in 1945.

The extent to which technological advances can affect the

status of an industry is well illustrated by a comparison of the diamond industry in World Wars I and II. The mines of South Africa, which then produced about 95% of the world output, were almost entirely closed down for about two years during World War I, because diamonds were considered a luxury that could well be dispensed with. In World War II diamonds were such an important factor in the war production program that the output was kept as high as conditions would permit.

**World Production.**—Production data were difficult to secure during the war years, and for many countries only estimates can be given. Table I presents the data as collected or estimated by S. H. Ball.

Table I.—World Production of Diamonds  
(Thousands of carats)

	1939	1940	1941	1942	1943	1944*
Angola . . . . .	690	784	787	792*	795	800
Belgian Congo . . . .	8,360	9,603	5,866	6,018	4,880	7,540
Gold Coast . . . . .	1,088	825*	1,000	1,000*	1,000	1,000
Sierra Leone . . . . .	600*	750	850	850*	850	850
South Africa . . . . .	1,250	543	158	118	302	699
South West Africa . . .	35	30	47	56	100	154
Brazil . . . . .	350*	325	325	300	275	320
Others . . . . .	127*	156*	155	148	150	139
Total . . . . .	12,500	13,016	9,188	9,282	8,352	11,502

\*Estimated.

**Cutting.**—Before World War II about 90% of the cutting industry was concentrated in Belgium and the Netherlands. When driven out of their homes, the cutters who could, made their way to other countries, and from 1940 on the small cutting industries that were scattered in other countries were enlarged, partly by the immigration of these workers, and partly by training new craftsmen. At the close of 1945 the United States, Palestine and Brazil were the most important centres of the industry, with smaller units in South Africa, Great Britain, Cuba, Puerto Rico, Canada, India and Borneo.

**United States Imports.**—The United States has long been the largest buyer of gem diamonds. For ten years the weight of industrial diamonds imported exceeded that of gem stones, though of course the value was much lower. Imports during World War II are shown in Table II.

Table II.—U.S. Diamond Imports, 1939-44  
(In thousands of carats)

	Rough	Cut	Industrial	Total
1939 . . . . .	154.0	488.2	3,568.7	4,210.9
1940 . . . . .	227.9	321.5	3,809.1	4,358.5
1941 . . . . .	215.0	229.6	6,882.2	7,326.8
1942 . . . . .	277.8	125.8	11,203.7	11,607.3
1943 . . . . .	751.2	193.7	12,084.1	13,029.0
1944 . . . . .	896.5	169.1	12,614.5	13,680.1

The rough stones imported in 1944 were valued at \$43,445,219, the cut stones at \$29,263,121 and the industrial stones at \$22,816,827; these values give average values per carat of \$48.46 for rough, \$173.06 for cut and \$1.81 for industrial stones.

(G. A. Ro.)

**Diatomite.** The annual production of diatomite in the United States was not reported, but the total sales for 1942-44 were 524,872 short tons, as compared with 360,502 tons in 1939-41. California and Oregon are the chief producers. The principal uses are as filter aid, insulation and filler. An important recent application was as a filter aid in portable high pressure filters for water supplies for the armed forces.

Brazil was reported to have developed a large production and consumption, possibly even of a magnitude to make the country the leading producer.

(G. A. Ro.)

**Dictatorships:** see COMMUNISM; FASCISM; GERMANY; SPAIN; UNION OF SOVIET SOCIALIST REPUBLICS.

**Diesel Engines:** see POWER ENGINEERING.

**Dietetics.** The trend in dietetics during 1945 was in the direction of (a) a revision of the recommended dietary allowances; (b) further appraisal of food composition; (c) simplification of calculations required for the estimation of the nutrient content of the diet; (d) further study of the "acceptability" of foods; and (e) reconsideration of sanitary requirements in food preparation.

**Recommended Dietary Allowances.**—The Food and Nutrition board of the National Research council made changes in the tabulated data and footnotes in view of new information and a need for clarifying the basis for certain recommendations. Since these recommendations will serve as a gross guide for the levels to be attained both in the normal diet and many therapeutic diets, it is reproduced in the table.

#### Further recommendations.

**—Fat.**—There is available little information concerning the human requirement for fat. Fat allowances must be based at present more on food habits than on physiological requirements. While a requirement for certain unsaturated fatty acids (the linoleic and arachidonic acids of natural fats) has been amply demonstrated with experimental animals, the human need for these fatty acids is not known. In spite of the paucity of information on this subject there are several factors which make it desirable that fat be included in the diet to the extent of at least 20 to 25% of the total calories and that the fat intake include essential unsaturated fatty acids to the extent of at least 1% of the total calories. At higher levels of caloric expenditure, e.g., for a very active person consuming 4,500 calories and for children and adolescent persons, it is desirable that 30 to 35% of the total calories be derived from fat. Since foodstuffs such as meat, milk, cheese and nuts may be expected to contribute "invisible" fat to the extent of from one-half to two-thirds of the total amounts of fat implied by the above proportions of the total calories, it is satisfactory to use separated or "visible" fats such as butter, margarine, lard and shortenings only to the extent of one-third to one-half of the amounts indicated.

**Copper.**—The requirement for copper for adults is about 1 to 2 mg. daily. Infants and children require approximately 0.05 mg. for each kilogram of body weight. The requirement for copper is approximately one-tenth that for iron. A good diet normally will supply sufficient copper.

**Iodine.**—The requirement for iodine is small, probably about 0.002 to 0.004 mg. daily for each kilogram of body weight, or a total of 0.15 to 0.30 mg. daily for the adult. This need is met by the regular use of iodized salt; its use is especially important in adolescence and pregnancy.

**Phosphorus.**—Available evidence indicates that the phosphorus allowances should be at least equal to those for calcium in the diets of children and of women during the latter part of pregnancy and during lactation. In the case of other adults the phosphorus allowances should be approximately 1.5 times those for calcium. In general, it is safe to assume that if the calcium and protein needs are met through common foods, the phosphorus requirement also will be covered, because the common foods richest in calcium and protein are also the best sources of phosphorus.

**Vitamin K.**—The requirement for vitamin K usually is satisfied by any good diet. Special consideration needs to be given to newborn infants. Physicians commonly give vitamin K either to the mother before delivery or to the infant immediately after birth.

**Salt.**—The needs for salt and for water are closely interrelated. A liberal allowance of sodium chloride for the adult is 5 grams daily, except for some persons who sweat profusely. The average normal intake of salt is 10 to 15 grams daily, an amount which meets the salt requirements for a water intake up to four litres daily. When sweating is excessive, one additional gram of salt should be consumed for each litre of water in excess of four litres daily. With heavy work or in hot climates 20 to 30 grams daily may be consumed with meals and in drinking water. Even then, most persons do not need more salt than usually occurs in prepared foods. It has been shown that after acclimatization persons produce sweat that contains only about 0.5 gram to the litre in contrast with a content of two to three grams for sweat of the unacclimatized person. Consequently, after acclimatization, need for increase of salt beyond that of ordinary food disappears.

#### Recommended Dietary Allowances (Revised, 1945\*)

Food and Nutrition Board, National Research Council

	Cal- ories	Pro- tein gm.	Ca gm.	Fe mg.	Vita- min A† I.U.	Thia- min‡ mg.	Ribo- fla- vin‡ mg.	Nia- cin‡ mg.	Ascor- bic Acid mg.	Vita- min D I.U.

\*Tentative goal toward which to aim in planning practical dietaries can be met by a good diet with a variety of natural foods. Such a diet will also provide other minerals and vitamins, the requirements for which are less well-known. This revision, at press Aug. 1945, to be published as National Research Council Reprint and Circular Series No. 122 "Recommended Dietary Allowances, Revised, 1945."

†The allowance depends on the relative amounts of vitamin A and carotene. The allowances of the table are based on the premise that approximately two-thirds of the vitamin A value of the average diet in the U.S. is contributed by carotene and that carotene has half or less than half the value of vitamin A.

‡For adults (except pregnant and lactating women) on diets supplying 2,000 calories or less, such as reducing diets, the allowances of thiamin, riboflavin and niacin may be 1 mg., 1.5 mg. and 10 mg., respectively. The fact that figures are given for different calorie levels for thiamin, riboflavin and niacin does not imply that we can estimate the requirement of these factors within 500 calories, but they are added merely for simplicity of calculation. Other members of the vitamin B complex also are required, although no values can be given. Foods supplying adequate thiamin, riboflavin and niacin will tend to supply sufficient of the remaining B vitamins.

§There is evidence that the male adult needs little or no iron. The requirement will be provided if the diet is satisfactory in other respects.

||For persons who have no opportunity for exposure to clear sunshine and for elderly persons, the ingestion of small amounts of vitamin D may be desirable. Other adults probably have little need for vitamin D.

¶During the latter part of pregnancy the allowance should increase approximately 20% over the preceding level. The value of 2,500 calories represents the allowance for pregnant, sedentary women.

\*\*Allowances for children are based on the needs for the middle year in each group (as 2, 5, 8, etc.) and for moderate activity and for average weight at the middle year of the age group.

††Needs of infants increase from month to month with size and activity. The amounts given are for approximately six to eight months. The dietary requirements for some of the nutrients such as protein and calcium are less if derived largely from human milk.

**Water.**—A suitable allowance of water for adults is 2.5 litres daily in most instances. An ordinary standard for diverse persons is one millilitre for each calorie of food. Most of this quantity is contained in prepared foods. At work or in hot weather, requirements may reach 5 to 13 litres daily. Water should be allowed *ad libitum*, since sensations of thirst usually serve as adequate guides to intake except for infants and sick persons.

**Food Composition.**—In cases of food allergy, the composition of various recipes may have to be changed to eliminate an offending food such as wheat, milk or eggs. A booklet of tested recipes has been recently published by the American Dietetic association for this purpose.

Further analyses of the mineral, vitamin, amino acid and cholesterol content of foods have been reported. Egg yolk and brain were the only foods shown to contain more than 1% cholesterol. In spite of the fact that these additional data have provided more adequately for an accurate evaluation of the nutritive content of the diet, it is still a laborious procedure to compute each item in a diet over a prolonged period of days. One method to shorten the computations is to use representative values for food groups. This method has been tested and found to correspond well with a detailed method of calculation. Two shortened methods of dietary calculation based on this principle have been published based on food habits in the southern part of the U.S. and on food habits in the north-central part.

**"Acceptability" of Foods.**—Critical studies have been made of the acceptability of foods in the army mess, air forces and civilian hospitals. In the army mess and in civilian hospitals it was found that fruit juices, fruits, fruit salads, meats, poultry, eggs, desserts, milk and milk drinks were well consumed. Food wasted in appreciable amounts were cooked and dry cereals, vegetable salads, lettuce from all salads, cooked vegetables, salad dressing, soups, bread and butter. Meat substitutes, generally used on the supper menu, made up another large part of the waste. Liver, fish, and ham loaf were the meats most frequently rejected. These studies served as a guide in ensuring greater adequacy in food intake and in the prevention of waste.

In the air forces it was found that anoxia (a diminution of oxygen in the blood) was directly proportional to the altitude. Since the oxygen requirement for carbohydrate metabolism is lower than for protein or fat, high carbohydrate preflight and in-flight meals were served to reduce susceptibility to anoxia and resulted in greater efficiency of air crews flying at medium altitudes without oxygen as well as for those operating at very high levels with oxygen. Postflight meals were high in minerals, vitamins and protein-rich foods. A tabulation of acceptability of approximately 100 foods in the air was made on the basis of some 10,000 meals served aloft.

**Sanitary Care in the Handling of Food.**—With the end of a global war, new diseases were introduced requiring not only revisions in ordinances and regulations for keeping food clean and sanitary, but also the proper control of the personnel who prepare and serve foods. Unless the personnel are trained to know why certain practices are demanded by superiors, they may negate the efforts of experienced dietitians. An injunction urging thorough cooking of all meats and meat products was a safeguard against the spread of diseases coming through the use of black market meat. (See also FOOD RESEARCH; VITAMINS.)

**Disasters.** During 1944 loss of life and property in accidents included the following:

## Aviation

- Jan. 8 Port of Spain, Trinidad. At least 23 persons were killed when passenger flying boat was wrecked and sunk as it alighted on water.
- Jan. 10 Los Angeles, Calif. Fog caused crash of passenger plane in canyon, killing all 24 persons aboard.
- Jan. 25 Mexico City, Mex. Nine persons, including Constantino Oumansky, soviet ambassador to Mexico, and Mrs. Oumansky, were killed when Mexican military plane crashed shortly after its take-off.
- Feb. 13 San Francisco bay, Calif. Twenty-four persons perished when navy transport plane plunged into San Francisco bay.
- Feb. 15 New York city. B-29 Superfortress crashed into Flushing bay, bringing death to at least five persons. Five others were listed as missing.
- Feb. 23 Near Cedar Springs, Va. Seventeen persons were killed and five were injured when commercial passenger plane developed engine trouble as it was flying through rainstorm and crashed into mountainside.
- April 14 Morgantown, W.Va. All 20 persons aboard air liner were killed when plane crashed into Chestnut ridge, 12 mi. east of Morgantown.
- July 28 New York city. Twin-engined army bomber lost in fog rammed into Empire State building between 78th and 79th floors, setting upper stories of world's tallest building afire; 13 persons, including 3 occupants of plane, were killed and 26 others were seriously injured.
- Sept. 7 Florence, S.C. Commercial air liner plunged into deep swamp, killing all 22 persons aboard.

**GREAT NORTHERN'S "Empire Builder"** took a toll of 34 lives, with more than 40 injured, when the locomotive of its second section telescoped the observation car of the first section at Michigan, N.D., on Aug. 9, 1945

- Sept. 15 Kansas City, Kan. Twenty veterans as well as crew of three were killed when military transport plane crashed on north bank of Missouri river after take-off from Fairfax airport.
- Nov. 3 Honolulu, Hawaii. At least 7 persons were killed and 12 others were missing following crash of air liner about 450 mi. northeast of Hawaii; 8 persons aboard were rescued.
- Nov. 8 Corpus Christi bay, Tex. Collision of two navy planes resulted in death of 22 officers and men.
- Dec. 3 Corrientes province, Argentina. U.S. army transport plane crashed on flight from Asuncion to Montevideo killing all 14 men aboard.
- Dec. 6 Off east coast of Florida. Five navy torpedo bombers with total of 14 men aboard and navy rescue plane with 13 men aboard vanished completely in waters off east coast of Florida.
- Dec. 8 Billings, Mont. Transport plane crashed in attempt to land in heavy snowstorm, killing 19 of 23 persons aboard.

## Fires and Explosions

- Jan. 31 Auburn, Me. Sixteen children and one adult perished in fire that swiftly swept through frame nursery for children of war workers.
- May 25 Edgewood arsenal, Md. Blast wrecked two buildings and caused death of at least 11 persons and injuries to 52 others who were loading hand grenades at army's Chemical Warfare Service headquarters.
- June 19 Sewell, Chile. Fire that broke out in Sewell copper mine, 125 mi. from Santiago, caused death of 139 persons.
- July 18 Viareggio, Italy. Explosion of stored enemy mines wrecked American Red Cross club, killing 24 U.S. soldiers and 12 Italian civilians.
- Aug. 13 Detroit, Mich. At least 13 persons perished in sudden fire that swept through box factory.
- Oct. 12 Okinawa. Six men were killed and 23 injured in explosion in navy receiving yard.
- Dec. 23 Shikoku, Japan. Twelve U.S. officers and men perished in fire of undetermined origin that destroyed medical battalion barracks.
- Dec. 25 Hartford, Conn. Short circuit which started Christmas tree fire set hospital aflame and brought death to 15 patients, and 3 other persons.

## Marine

- Feb. 5 Upper New York bay, N.Y. At least 19 persons were killed, an unknown number missing and 74 injured when tanker loaded with 120,000 drums of high-octane gas exploded after crash with second tanker.
- April 9 Bari, Italy. U.S. Liberty ship loaded with aerial bombs blew up in harbour causing at least 360 deaths and injuries to 1,730 others; origin of blast was not known.
- April 9 In mid-Atlantic. Four persons were killed and 27 were missing when two tankers in Allied convoy collided.
- April 12 Southeast coast of Massachusetts. At least 15 men were killed and 7 were missing in collision between U.S. freighter and Allied tanker.
- April 23 Cape Elizabeth, Me. Forty-nine lives were lost when U.S. navy patrol ship exploded; cause of blast was not known.
- May 17 London. British admiralty lifted censorship to disclose that troop transport "Queen Mary" rammed and sank British cruiser "Curacao" off coast of Donegal, Oct. 2, 1942; "Curacao" sank in five minutes with loss of 338 naval personnel.

## Natural Disasters

- Feb. 8-9 New England. At least 20 persons were killed and considerable property damage was wrought by blizzard that piled up huge drifts in most of New England.

- Feb. 12 Mississippi-Alabama. At least 43 persons were killed and hundreds injured by tornado sweeping across parts of Mississippi and Alabama; property damage was heavy.
- March 7 Cincinnati, O. Ohio river rose above flood stage and floodwaters of other midwestern rivers spread into Ohio, Pennsylvania, West Virginia, Kentucky and Indiana, paralyzing war plants and transportation, causing heavy damage and taking toll of more than ten lives.
- April 12 Oklahoma-Arkansas-Missouri area. Tornado slashing through tri-state region caused more than 100 deaths and substantial property damage.
- July 9 Lehigh valley, Pa. and N.J. At least six persons were killed in electrical storm which caused heavy property damage.
- Sept. 15-18 Florida, Georgia and Bahama Islands. Terrific winds reaching peak speed of 143 m.p.h. ravaged large areas in south Florida and Bahamas, destroying three hangars, 25 patrol blimps and 366 aeroplanes at navy's air base at Richmond, Fla.; damage was estimated at \$50,000,000.
- Oct. 9 Okinawa. Forty-three persons were killed, 30 were listed as missing and 49 were injured in typhoon that swept island, sinking 8 vessels and grounding about 200 others, mostly small craft.
- Nov. 30 Northeastern United States. Raging storm accompanied by heavy gales and snows caused death of at least 34 people and wreaked considerable property damage as it swept over New England, New York state and New Jersey.

**Railroad**

- Feb. 1 Cazadero, Mex. About 100 persons perished when freight train crashed into rear of passenger train packed with pilgrims bound for religious festival. Fire that quickly consumed nine wooden coaches caused most of fatalities.
- June 15 Milton, Pa. At least 20 persons were killed and 32 others injured when express train jumped track and plowed into freight train going in opposite direction.
- Aug. 9 Michigan, N.D. Thirty-four persons were killed and at least 40 others injured when second section of passenger train crashed into first section.

**Traffic**

- June 25 Near Joplin, Mo. Loaded passenger bus struck a cow, plunged down embankment and overturned, killing 12 persons and injuring 28 others aboard.
- Nov. 26 Lake Chelan, Wash. Fourteen school children and bus driver were drowned when school bus dived over 50-ft. embankment into Lake Chelan during blinding snowstorm.

**Disciples of Christ.**

Statistics as of June 30, 1945, showed a total membership of 1,701,028 in the United States and Canada (Canada 9,080). This was a net gain of 19,095 for the year. Reported additions were about normal—50,607 by baptism, 45,903 otherwise—4,803 more than in 1944. (Actual additions must be more than reported, or membership less, to balance losses by death and provide more than a 5% increase.) In 1945 there were 8,004 churches in the United States and Canada (a gain of 6), and 7,448 ministers (a loss of 324). Chaplains in the armed services numbered 406. Disciples had churches in 39 other countries, most of which are not mission fields. There were 12,101 members in Great Britain, 32,522 in Australia, 4,327 in New Zealand (a loss of 663, a gain of 2,283, and a loss of 324, respectively). There was still no report from Poland, previously listed as having 65 churches and (estimated) 40,000 members. The total world membership in 1945 was 1,867,591 (gain, 21,762, as compared with a gain of 3,706 for 1944). Receipts and expenditures for local church maintenance in the United States and Canada increased to \$20,909,535 (increase, \$4,891,774); for missions and benevolences, after being suddenly almost tripled to \$5,505,779 in 1943, subsided to a more normal \$3,469,972 in 1944 and rose to \$8,759,872 in 1945. The foreign mission agency was able to continue its work in all fields except Japan and the Philippines, and was preparing to re-enter these. The missionary magazine, *World Call*, increased its monthly circulation (as of Nov. 1945) to 60,399, an accelerating gain of 71% from 1942 to 1945. The international convention of Disciples of Christ (U.S. and Canada) met at Columbus, Ohio, Oct. 17-22, 1944, under the presidency of the Rev. C. E. Lemmon of Columbia, Mo.; the 1945 convention was omitted. Dr. M. E. Sadler, president of Texas Christian university, Fort Worth, Texas, was president of the convention which was called to meet in Oakland, Calif., Aug. 6-11, 1946. (See also CHURCH MEMBERSHIP.)

(W. E. GA.)

**District of Columbia:** see WASHINGTON, D.C.  
**Divorce:** see MARRIAGE AND DIVORCE.

**Dodecanese.** A group of 12 islands in the Aegean sea. Area 1,035 sq.mi., pop. (1936) 140,848. Capital, Rhodes (27,466). The islands were occupied by Italy in the war against Turkey in 1912, and were officially ceded to Italy by Turkey in 1924. As the inhabitants of the islands are in the large majority Greeks, the Greek government demanded in 1945 the cession of the islands from Italy to Greece. The Greek demand was supported by the United States and Great Britain. Soviet Russia was reported to have demanded a trusteeship over the islands or at least a cession of military bases in the islands. (See also ITALIAN COLONIAL EMPIRE.) (H. Ko.)

**Doenitz, Karl** (1892— ), German naval officer, was born Sept. 16, in Berlin. He was commissioned an ensign in the Imperial German navy in 1913 and served in a submarine division during World War I. Taken prisoner by the British in 1918, he was committed to an insane asylum. He was repatriated in 1919, but the suspicion existed that he feigned insanity to hasten his release. After the war, he resumed his association with the German navy. Testimony produced by the prosecution at the Nuernberg war crimes trial in Nov. 1945 indicated that soon after the end of World War I the Germans were engaged in building submarines in violation of the Versailles treaty. In 1933, Doenitz was believed to have assisted in the construction of hidden U-boats and in training crews to man them. He was chief of the U-boat force, 1939-43, and was made grand admiral and commander in chief of the German navy in 1943. Doenitz was credited with development of the destructive "wolf-pack" technique of submarine warfare. On May 1, 1945, Doenitz announced the death of Adolf Hitler and declared that before he died Hitler had designated Doenitz as his successor. The new fuehrer conceded in a broadcast, May 5, that resistance against the western Allies had become senseless, but exhorted the wehrmacht to continue fighting against the Russians. The Allies blocked this attempt to drive a wedge between them and insisted that only unconditional surrender to Britain, U.S.S.R. and the United States would be accepted. As German resistance was disintegrating rapidly, Doenitz had no alternative but to comply with the Allied directives, and he ordered his envoys to sign the Allied unconditional surrender terms on May 7, at Reims, France, and in Berlin, May 8. The Allies dissolved his government, May 23, and arrested Doenitz, who was one of the principal defendants at the Nuernberg trials that started Nov. 20.

**Dog Racing.** The lifting on May 9, 1945, of the ban on animal racing brought a quick return of the galloping greyhound to United States dog racing centres, especially in New England and Florida. Free spending once again kept the mutual receipts far above average and brought a record payoff of \$2,850 for a daily double at a Miami track. In England, a record price of \$10,000 was paid for Magic Bohemian, a greyhound which had attracted attention by winning a 525-yard race in 29.1 seconds. (M. P. W.)

**Dog Shows:** see SHOWS.

**Dominica:** see WEST INDIES, BRITISH.

**Dominican Republic.** A West Indian republic occupying the eastern two-thirds of the island of Haiti or Hispaniola. Area, 19,129 sq.mi.; pop. (est. Jan. 1945) 1,999,276. The major part of the population, at least 75% of which is of mixed blood, is concentrated around Ciudad

Trujillo in the south or in the northern Cibao lowlands. The capital is Ciudad Trujillo (formerly Santo Domingo) with a pop. (1945 off. est.) of 123,780. Other urban centres are Puerto Plata (15,610), San Pedro de Macoris (22,728), Santiago de los Caballeros (54,113); (1944 off. est.) Barahona (13,751), La Romana (13,814), San Francisco de Macoris (15,418). Religion predominantly Roman Catholic; language: Spanish. President in 1945: General Rafael Leónidas Trujillo Molina.

**History.**—The political history of the Dominican Republic in 1945 was generally uneventful. On May 29 President Trujillo invited political leaders to reorganize the nation's political parties, inactive from 1930. A new executive department entitled Labour and National Economy was created June 1.

In the field of foreign affairs it was announced in March that diplomatic relations with the soviet union had been established, and in June during the United Nations conference in San Francisco representatives there signed a nondiscrimination pact with China. The republic in September became the third nation to sign the United Nations charter, with congress also approving the statute setting up the Court of International Justice. Following the visit in April of a mission soliciting contributions to the United Nations Relief and Rehabilitation administration, the government announced that the republic would make a preliminary gift of \$350,000, two-thirds of which would be in corn. War censorship on postal and cable service was ended Aug. 28.

President Trujillo announced in April that the government would establish an agricultural mortgage bank, and in November he submitted to congress a bill for the expenditure of \$5,000,000 on the construction of 25,000 low-cost houses.

A press report at the beginning of the year stated that the republic had repaid \$500,000 on lend-lease from the United States; the latter country in October disclosed that military lend-lease goods supplied to the Dominican Republic from March 1941 to July 1945 had amounted to \$1,140,000 in value.

**Education.**—In 1943 primary schools were estimated to number 1,896, with an enrolment of 203,990 students; 79 intermediate schools had an enrolment of 7,545. Enrolment at the University of Santo Domingo (1940) was 868. President Trujillo presented to congress in late September a bill providing for free public instruction in secondary and normal schools, according to a press report.

**Finance.**—The monetary unit is the peso, pegged in value at par with the U.S. dollar. A budget for 1945 of 21,418,133 pesos was reportedly approved in January. Revenue for 1944 amounted to 22,537,689 pesos, about 1,600,000 pesos more than 1943. At the close of 1944 the bonded indebtedness amounted to 11,980,167 pesos. By a decree of Jan. 31, U.S. 5-cent coins placed in circulation during World War II were replaced by national coins.

**Trade and Communications.**—Exports for 1944 were valued at 60,269,328 pesos (1943: 36,205,057 pesos) and imports at 18,524,575 pesos (1943: 14,370,804 pesos). Sugar sent to Great Britain under contract made up 72% of exports. Effective Oct. 1, 1945, import controls were removed on all but a few critical items.

The republic in 1944 had 163 mi. of public railway and 622 mi. of sugar plantation railroads. There were about 1,200 mi. of improved highways and 2,150 mi. unimproved. Motor vehicles in operation Jan. 1, 1945, were reported to number 1,168 automobiles, 790 trucks, 117 buses. In the early part of the year the nation's most noticeable shortage was that of tires, which seriously affected transportation by truck of basic supplies.

**Agriculture and Mineral Production.**—Sugar production for the 1944-45 season totalled 416,630 short tons (1943-44:

562,585 short tons). Exports for the first six months of 1945, mainly to the British Isles and Canada under contract, amounted to 283,891 short tons. Coffee output for 1944-45 was estimated at about 425,000 bags of 132 lb. each, with exports for the first eight months of 1945 amounting to 14,937 short tons. Exports of cacao for the first eight months amounted to 15,241 short tons, compared with 26,108 short tons in an equal period in 1944. It was estimated that the 1944 tobacco crop would be small: not more than 3,858 short tons compared with the 13,023 short tons reported for 1943. Exports of leaf tobacco (1944) amounted to 1,097 short tons (1943: 8,223 short tons); cigars, 213,425 pieces (1943: 85,575 pieces). Banana exports for 1944 amounted to 428,097 stems (1943: 693,005 stems). Yucca starch exports (1944) amounted to 13,542 short tons. Mahogany exported in 1944 was estimated at 1,519 short tons; lignum vitae 747 short tons; pine wood 11,141,265 bd.ft.

Gold exported in 1944 amounted to 988 oz., valued at 23,902 pesos; salt to about 2,240 short tons; gypsum, to 2,366 short tons.

**Donations and Bequests.** The year 1945 set a record in the history of U.S. philanthropy, according to estimates based on a continuing study of donations and bequests in eight of the largest cities of the country. The study, which had been in progress for 15 years, analyzed publicly announced gifts and bequests of \$1,000 and more to philanthropic organizations in New York, Chicago, Philadelphia, St. Louis, Los Angeles, Boston, Baltimore and Washington, D.C.

The 1945 total of gifts in these cities was \$191,134,648, compared with \$161,198,206 in 1944, or an increase of 18.57%.

Using this study of total gifts for the eight cities as a basis of estimate, 1945 gifts to U.S. philanthropy were expected to reach \$2,300,000,000, including all types of gifts—corporate, foundation and individual. Although this increase in 1945 was due almost entirely to several large gifts, many of more than \$1,000,000, the study showed the trend of individual giving, both small and large, was decidedly upward. Large gifts announced during the year covered a wide field of philanthropy.

In the educational field, Thomas W. Lamont gave \$1,500,000 to Harvard, in Cambridge, Mass., for an undergraduate library; Herbert L. Dillon presented \$1,100,000 to Princeton, in Princeton, N.J., for a gymnasium; the Statler foundation gave \$1,000,000 to Cornell, in Ithaca, N.Y., for studies in hotel administration; the Glenn L. Martin company gave \$800,000 to the University of Maryland, in College Park, Md., for the development of an aeronautical college, supplementing an earlier gift of \$1,700,000, and New York department stores gave \$500,000 to the New York university school of retailing. There were also several \$100,000 to \$500,000 individual gifts to educational institutions.

In the field of health, the Alfred P. Sloan foundation presented \$4,000,000 to Memorial Hospital in New York for the Sloan-Kettering Institute for Cancer Research, which touched off a fund-raising campaign for a like amount for teaching, treatment, research and prevention of cancer, and a published report in December announced that \$1,001,605 had already been raised toward this end.

John D. Rockefeller, Jr., made several publicly announced personal gifts of \$100,000 or more, among which were \$1,000,000 to the World Council of Churches for rehabilitation in Europe, and \$300,000 to the National War Fund.

Outside of the cities included in the study, other publicly announced large gifts were \$4,000,000 distributed by H. R. Cullen among four Houston, Texas, hospitals; \$1,000,000 to Notre Dame from Peter C. Reilly of Indianapolis, for a science fund; \$500,000 from the Humble Oil and Refining company to San Jacinto Memorial hospital in Harris county, Texas, and \$450,000 from Dr. Theodore L. Chase, a former resident of Philadelphia, to Temple university, Philadelphia, to be used principally for research in cancer.

Bequests in the eight cities totalled \$18,171,649 as compared with \$34,677,696 in 1944. This decrease was not significant, as the estates of many persons dying in 1945 would not be distributed for a year or more. For instance, in the 1945 study, there was a considerable amount of money included which was distributed from the estates of persons dying as far back as 53 years ago.

The trend in philanthropic giving in 1945 for the eight cities was as follows: war relief organizations and community war chests received the greatest amounts, \$63,073,499 and \$58,449,038, respectively; organized social work and education followed next with more than \$21,000,000 each; health agencies received \$15,480,938; foreign relief, \$7,919,959; religious organizations, \$1,796,492 and the fine arts, \$1,363,014.

As usual, New York city led with gifts of \$91,569,332, followed by

Chicago, \$23,352,485; Philadelphia, \$19,186,213; Los Angeles, \$15,704,580; Boston, \$13,753,268; Baltimore, \$9,923,366; Washington, D.C., \$8,864,391, and St. Louis, \$8,776,013. (See also COMMUNITY CHEST; SOCIETIES AND ASSOCIATIONS; WAR RELIEF, U.S.) (J. P. J.)

**Doolittle, James** (1896– ), U.S. army air officer, was born Dec. 14 at Alameda, Calif. During World War I he served as a flying instructor, and when peace came he completed a course in engineering at Massachusetts Institute of Technology, Cambridge, Mass., graduating in 1925 with a doctor of science degree. He returned to active army service in 1940, and in Jan. 1942 was promoted to the rank of lieutenant colonel in the air corps. Doolittle electrified the world on April 18, 1942, during World War II, by leading a U.S. squadron of 16 B-25 bombers in a spectacular daylight raid over Tokyo. He was made a brigadier general and awarded the congressional medal of honour. Transferred to Africa, he was advanced to the rank of major general. On Feb. 26, 1943, he became head of the bomber command in the Northwest Africa air forces, and in the following December was named commander of the 8th U.S. air force. On March 14, Doolittle was nominated for the rank of lieutenant general. After the end of the war in Europe, Doolittle and part of the 8th air force were assigned to the Pacific war, May 26, 1945. Shortly afterwards Doolittle arrived at Guam (July 23), but the war with Japan ended before he could fully employ the 8th air force in the Pacific area. A proponent of a unified command, Doolittle was angered by comment from two admirals that sea power and carrier-based planes won the war against Japan, and he asserted Nov. 9, "our B-29 boys are resting uneasily in their graves as a result of these two comments." Doolittle was scheduled to leave the air force Jan. 1, 1946, to become a vice-president of an oil firm.

**Douglas, Lord Alfred (Bruce)** (1870–1945), English poet, was born on Oct. 22, 1870, the third son of the eighth marquess of Queensberry and Sibyl, younger daughter of Alfred Montgomery. Well-born, handsome and gifted, educated at Winchester and Magdalen college, Oxford, Lord Alfred Douglas might well have looked forward to a brilliant career in the London of the 1890s. Instead, his entire life was influenced and overshadowed by his early friendship with Oscar Wilde, which led to the latter's imprisonment and downfall. He became embittered and almost fiercely litigious, invoking the law of libel at the mere association of his name with Wilde's career, and incurring endless troubles and controversies, including an imprisonment for a libel on Winston Churchill in 1923.

Yet Lord Alfred Douglas was a poet of distinction, who in his sonnets showed himself capable of excellent and sometimes exquisite verse. His first book of poetry, *The City of the Soul*, was published in 1899, followed by *Sonnets* in 1909, and in 1924 he published *In Excelsis*, a sonnet-sequence in which he shows the soul full grown. In 1938 he published *Without Apology*, a biographical work, followed in 1940 by *Oscar Wilde—A Summing Up*.

In 1902 Lord Alfred Douglas married Olive Eleanor Custance, by whom he had one son. He died at Lancing, Sussex, on March 20.

**Dreiser, Theodore** (1871–1945), U.S. author, was born Aug. 27, in Terre Haute, Ind. For early career, see *Encyclopædia Britannica*. Dreiser, who lived in semi-retirement in Hollywood, Calif., during the last ten years of his

life, wrote little after his widely popular novel, *An American Tragedy* (1925). His later works include *Epitaph* (1930), *Dawn* (1931), *Tragic America* (1932), *Thoreau* (1939) and *America Is Worth Saving* (1941). At the time of his death, it was announced that he had completed two novels—the first in 20 years—*The Bulwark* and *The Stoic*, which were to be published posthumously. He received the award of merit from the American Academy of Arts and Letters for fiction in May 1944. Dreiser died at his home in Hollywood, Dec. 28.

**Drugs and Drug Traffic.** Seizures of drugs and devices in the United States in violation of the Food, Drug and Cosmetic act in the fiscal year 1945 increased by nearly 80% over similar actions in 1944. The largest increase involved proprietary preparations bearing false and misleading therapeutic claims or falling below labelled composition. Progress continued, however, in the Food and Drug administration's campaign to drive from the market "cure-alls" inviting self-treatment for such serious diseases as tuberculosis and cancer, which might delay competent medical treatment with fatal results. Many of the misbranded preparations, attempting to exploit war-weary and nervously exhausted persons, bore unwarranted claims for restoring vigour, preventing sluggishness, or providing nutritional elements that should be present in the normal diet.

Estimation of data accompanying new drug applications is becoming more complex as revolutionary new preparations and new uses for older compounds are proposed. Before applications are permitted to become effective, these data must demonstrate the safety for use of the new drug and the adequacy of manufacturing controls. In the fiscal year 1945, 132 new drugs were thus cleared for distribution.
